FORTHCOMING EVENTS.

Friday, January 6.
Birmingham Architectural Association: Mr. C. Spooner on “Modern Churches.”
Monday, January 9.
Architectural Association: Mr. H. H. Statham on “Architecture as Plan and Section.”
Liverpool Architectural Society: Paper by Mr. P. Morley Horder.
London Institution: Professor E. A. Gardner on “Art as Expression and as Illustration.”
Royal Academy: Lectures on Painting by Sir W. B. Richmond, K.C.B., R.A. (1) “Choice of Subjects.”
Tuesday, January 10.
Guild of Architects’ Assistants: Mr. H. Guicharde Todd on “Art and Registration.”
Wednesday, January 11.
Northern Architectural Association: Paper by Mr. J. Walton Taylor.
Thursday, January 12.
Royal Academy: Lectures on Painting by Sir W. B. Richmond, K.C.B., R.A. (2) “Some Great Portrait Painters.”
London Institution: Mr. D. G. Hogarth on “Cretan Discoveries.”
Monday, January 16.
Royal Institute of British Architects: Mr. Halsey Ricardo on “Cardinal Medici’s Pleasure House.” Award of Prizes and Studentships.

ARCHITECTURE IN 1910.

IN common with every other department of our national life, the event of the past year for architecture has been a sad one—the decease of KING EDWARD VII.

THE POLITICAL ATMOSPHERE

of the past year has not in other respects been favourable to the business of building. We cannot have two general elections in one year, and the consequent abnormal outlay of some four millions sterling, without architects and builders feeling the effect of such a diversion of expenditure by the classes who are the more likely section of the community to furnish clients. Nor can the

NEW METHODS OF TAXATION

which have been introduced fail to have a prejudicial effect on those who are disposed to look on bricks and mortar as a desirable form of investment, not so much from the nature of the imposts themselves—for capital in the long run is always able to protect itself, and the ultimate incidence of land taxes is not on those who own the land, but on those who borrow the use of it—but the introduction of fresh methods of taxation induces a feeling of insecurity and uncertainty as to the finality of the present burdens; hence nobody is inclined to invest or speculate in land and buildings when there is nothing more definite on which to base calculations than a vague fear of indeterminate liabilities. It has been asserted that there is a

REVIVAL OF TRADE

generally in this country; but this must be discounted by a consideration of the general rise of prices in all commodities throughout the world, part of which rise is due to the effect of lessened production in the slack times from which we have been suffering for some years—that

is to the regular swing of the pendulum as it oscillates between boom and slump—but the greater part to the cheapening of gold which is a necessary consequence of its increased production at less cost. Gold is now practically universally the standard of currency throughout the world, and when the amount of it is largely increased, with a concurrent lessened cost of obtaining it, its value, compared with other things, is diminished, and there is a general rise in the nominal price of all things that are paid for in gold. It has also been asserted that the

CONDITION OF THE BUILDING TRADE

is improving in this country because the percentage of the unemployed in the trade unions is somewhat less than it was a year ago; but here again the assertion is made without consideration of the remarkable diminution of trade union membership that has occurred. That is to say, the building trades are in such a parlous condition that many of the aristocracy of labour, the skilled workmen, can no longer afford to belong to trade unions. Hence the percentage of unemployed in the actual membership of the unions is not a true criterion of the amount of unemployment in the building trade. The greater number of the unemployed and of the partially employed is to be found amongst those workmen who are not members of the unions.

Even if the general trade of the country were commencing to improve, this does not imply any immediate increase of building activity, for the building trade is always one of the last to feel the effect of any wave of prosperity in the general community. Certainly a general inquiry amongst architects, quantity surveyors, and contractors would dispel any idea that improvement has as yet become manifest, or is likely to occur in the building trade for some little time to come.

GAWSORTH HALL—THE HOME OF THE FITTONS IN QUEEN ELIZABETH'S REIGN.

THE PRIEST'S HOUSE, PRESTBURY, WITH OPEN-AIR ROSTRUM.

One of the notable features of the past year has been the remarkable awakening of public interest in

TOWN PLANNING,

due primarily to the coming into operation of the Housing and Town Planning Act, but even more largely to the extraordinarily successful Conference and Exhibition organised and carried through by the Royal Institute of British Architects, which attracted visitors from all over the world, including some of the most prominent experts of Germany, France, and the United States, and furnished the British public, as well as the architects of this country, with some idea of what is meant by Town Planning. At the same time it has assisted in adding to the influence of the Royal Institute of British Architects with the British public, and the respectful recognition of its position which has of late been one of the most encouraging developments in the world of architecture.

Although we have still much to learn in this country with regard to town planning, the Conference has done much to afford instruction from the experiences and experiments of other countries even more than from the high-flown eloquence of some of our would-be "experts" in town planning.

Besides that held by the Royal Institute of British Architects, other conferences have been held during the year under the auspices of the National Housing and Town-planning Council, at which the discussions have been of a more practical and useful character than those at Conduit Street.

The close of the year has seen the result of the first town-planning competition of any importance in this country—that for the design of the new town of Ruislip Manor, Middlesex. A critique of the drawings submitted in this competition we give elsewhere in this issue.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS, in addition to the Town-planning Conference, has in the past year erected other notable landmarks in its history. A new set of by-laws, after considerable discussion, has

been adopted, in which several vital modifications have been made in the polity of the Institute. The problem of better housing accommodation has to a certain extent been solved by the adaptation of further galleries at No. 9 Conduit Street, which might have been acquired years ago at far less cost than now, had the rulers of the past been wise enough to seize opportunities offered. The regulations for competitions have been revised and brought more nearly up to date than those that were closely modelled on the old "suggestions." The increase of the nominal membership of the Institute by the creation of the new class of

LICENTIATES

has been considerable, but is still far short of the ideal inclusion of all worthy and qualified architects within the ranks of the representative body of the architectural profession. In part this has no doubt been due to the position taken up towards the scheme of licentiate-ship by the Council of the Society of Architects, who have advised their members not to join the ranks of licentiates; in part it is the result of that spirit of apathy and love of selfish isolation which has kept many architects outside the ranks of any professional society, some of them, no doubt, from a feeling that they are not sufficiently genuine and qualified architects to be admitted into any society, and some from a consciousness that they are not prepared to sign a declaration that they will conduct their business in the future in an honest and straightforward manner.

To awaken from apathy some of those who are not as yet members of any architectural society, to explain the present position of the Royal Institute, and to dispel false ideas, a missionary tour has been undertaken by Messrs. A. W. S. CROSS and GEORGE HUBBARD, as representatives of the Council of the Institute, and many wandering sheep have thus been brought into the fold. But no propaganda can bring every so-called architect within the ranks of the Royal Institute of British Architects, and any expectation that the scheme of licentiate-

THE PORTICO, HANDFORTH HALL.

CHORLEY HALL, ALDERLEY.

ship would do so was foredoomed to disappointment, and those who indulged or professed to indulge in such an expectation may say, if they like, that the scheme of licentiate-ship has failed. As a means of enrolling in the corporate body of the profession a large number of architects who would otherwise have remained outside the scheme of licentiate-ship must be admitted to have proved a success.

REGISTRATION

of some kind has thus during the past year been brought appreciably nearer, and in earnest thereof it must be recorded that the Council of the Royal Institute has approached the Council of the Society of Architects with a view to a joint consideration of the terms of a proposed Bill.

The Royal Institute has taken a noteworthy stand in a matter of great public importance, at least to the Metropolis, the scheme for

ST. PAUL'S BRIDGE,

and the position of the Institute is unassailable in regard to the question. Recognising that the scheme as put forward by the Corporation is decidedly faulty, the Council of the Institute has, with great tact and forbearance, declined to be drawn into the false position which has been offered of proposing a definite scheme, but has taken its stand upon the firm basis that the Corporation should obtain the best architectural advice before commencing to carry out any scheme. We are glad to be able to record that at the last moment, and although plans have been lodged for Parliamentary sanction, the Bridge House Estates Committee have taken the Institute's petition into consideration and admitted the President to a conference.

One very vital objection to the Corporation's scheme is the imminent danger to

ST. PAUL'S CATHEDRAL

which would ensue from the proposed tram-subway on the east side, and Mr. MERVYN MACARTNEY, the Surveyor to the Fabric, would have failed in his duty if he had not called public attention to the possibility—nay, probability—of a terrible catastrophe to the Metropolitan cathedral if this tram-subway is carried out. Mr. MACARTNEY's apprehension is no bogey. It is as absolutely sure as anything

can be that if the tram-subway proposed is carried out it will be at the risk, we do not say certainty, but the very extreme risk, of a movement of the none too reliable foundations of St. Paul's Cathedral that may bring about the direst disaster. The advantages of a through tramway connection between the north and south of London will surely be too dearly bought if the passengers some morning find the dome of St. Paul's a shattered mass of ruin on the floor of the nave.

CANTERBURY CATHEDRAL

has seen in the last week of the year the completion of a definite section of its restoration by the ceremony of placing in position, by the Archbishop of CANTERBURY, of the top stone of the last of the four pinnacles of the north-west tower. Dean WACE records that, following the restoration of the interior of the cathedral and the chapter house at a cost of 20,000*l.*, the completion of the reparation of the central tower in 1908 at a cost of about 15,000*l.*, the work on the western towers has entailed an expenditure of 7,700*l.*, and still requires a further sum of 2,000*l.* The repair of the south-west tower is estimated to cost 5,228*l.*, and that of the nave, pinnacles, and other parts of the building another 6,000*l.* At

WINCHESTER CATHEDRAL

work has been continued during the past year, bringing up the total of expenditure to 97,000*l.*, but Dean FURNEAUX states that "a few thousands" are still required to complete the work; so that it looks as if the amusing estimate of 99,000*l.* will be enlarged, as we expected, beyond the round 100,000*l.*

LIVERPOOL CATHEDRAL

is making steady progress towards completion, and the past year has seen the dedication of the Lady Chapel, with the adoption of a remarkable revision of the original design for the body of the church.

The preservation of the

ANCIENT MONUMENTS

of the country has been advanced by the passing of an amending Ancient Monuments Protection Act and by the work of the Royal Commissions appointed for England, Scotland, and Wales respectively, and the publication of

SCHOOL AND SCHOOL-HOUSE, ARLEY GREEN.

their interim reports. The inventory for Hertfordshire is a model which we hope to see followed at no distant date by other publications of a similar character.

PHOTOMETRY

has during the past year been brought into prominence as a valuable science in practical architecture.

THE BRUSSELS EXPOSITION

has afforded an opportunity for the study of architecture, particularly that of modern Europe, by gathering together examples of the methods of design in vogue amongst different nationalities.

IMPORTANT BUILDINGS COMPLETED

during the past year include Lancaster Town Hall, at a cost of 155,000*l.*, of which the late Mr. E. W. MOUNTFORD and his partner, Mr. F. DARE CLAPHAM, were the architects; the Mitchell Library, Glasgow, costing between 50,000*l.* and 60,000*l.*, designed by Mr. WILLIAM B. WHITTIE; Municipal Buildings for South Shields, at an expenditure of 70,000*l.*, of which Mr. E. E. FETCH was the architect; Bethnal Green Town Hall, London, the designs for which, by Messrs. PERCY ROBINSON and F. ALBAN JONES, were selected in competition; new offices for the Anglo-American Oil Company, Queen Anne's Gate, Westminster, of which Mr. ERNEST RUNTZ was the architect, and which have cost some 60,000*l.*; the Finsbury Park Empire Theatre, London, costing 45,000*l.*, carried out under Messrs. FRANK MATCHAM & Co., who have also altered and enlarged the old Hengler's Circus into the London Palladium at an expense of 200,000*l.*; Agricultural buildings for Cambridge University, by Mr. ARNOLD MITCHELL; Nurses' Home for Leicester Infirmary, of which Messrs. EVERARD, SON & PICK were the architects; the churches of St. Mellitus, Hanwell, and All Saints, Bedford, both designed by Sir ARTHUR W. BLOMFIELD & SONS, the latter in collaboration with Mr. GEORGE P. ALLEN; the church of St. Chad, Burton-on-Trent, costing 47,500*l.*, of which the late Mr. G. F. BODLEY, R.A., and his successor, Mr. C. G. HARE, were the architects.

IMPORTANT WORKS COMMENCED

include public buildings at Burslem, which are being erected at a cost of about 25,000*l.* from the designs of Messrs. RUSSELL & COOPER, selected in competition; Grand Lodge premises, George Street, Aberdeen, to cost 30,000*l.*, of which Mr. A. HUNTER CRAWFORD is the architect; extensions to Stoke-on-Trent Town Hall by Messrs. WALLIS & BOWDEN at an expenditure of about 26,000*l.*; the Royal Academy of Music, Marylebone, the design of which, by Messrs. ERNEST GEORGE & PETO, was exhibited at the Royal Academy of Arts; the Burgh Academy, Dumbarton, designed by Messrs. MACWHAN-

NELL, ROGERSON & REID, to cost 30,000*l.*; additional premises for Messrs. WHITELEY to the amount of 150,000*l.*, of which Messrs. JOHN BELCHER, R.A., and J. J. JOASS are the architects; extensions to Swansea General Hospital, under Mr. GLENDINNING MOXHAM, at a cost of about 25,000*l.*; new county buildings for Berkshire at Reading, designed by Messrs. WARWICK & HALL; new premises at Leeds for the Pearl Life Assurance Company, involving an expenditure of 60,000*l.*, for which Mr. WILLIAM BAKEWELL's design was selected in a limited competition; new buildings for cancer treatment and research at Middlesex Hospital, designed by Mr. EDWIN T. HALL, which will cost some 50,000*l.*; new opera house for Mr. OSCAR HAMMERSTEIN in Kingsway, London, the expenditure on which will amount to 100,000*l.*, and of which Mr. BERTIE CREWE is the architect; the church of Holy Trinity, Kingsway, by Messrs. JOHN BELCHER, R.A., and J. J. JOASS; the parish church of Broadstairs, Kent, by Mr. W. WILLMOTT; St. Gabriel's Church, Sunderland, by Mr. CLAYTON GREENE; and a church at Dorchester, by Mr. C. E. PONTING.

The most important of the

COMPETITIONS

decided during the past year was that for the National Museum for Wales, in which the assessors, Sir ASTON WEBB, C.B., R.A., Mr. J. J. BURNET, and Mr. EDWIN T. HALL, awarded the first place to Messrs. A. DUNBAR SMITH and Mr. CECIL C. BREWER, the second to Mr. T. L. VESPER, the third to Mr. H. T. HARE, and the fourth to Messrs. DAVID MILNE and J. WILLIAM HEPBURN.

Other open competitions of importance were those for the Usher Hall, Edinburgh, and the enlargement of the Queen's University, Belfast. In the former the assessor, Sir ASTON WEBB, C.B., R.A., placed first the design of Messrs. STOCKDALE, HARRISON & SON and Mr. HOWARD H. THOMPSON; second, that of Mr. F. W. SIMON; third, that of Mr. H. E. CLIFFORD, and fourth, Mr. WILLIAM HEYWOOD. At Belfast Sir ASTON WEBB was also the assessor, and awarded the first place to Mr. W. H. LYNN, R.H.A., the second to Messrs. HENRY TANNER and F. DARE CLAPHAM, and the third to Messrs. A. MARSHALL MACKENZIE & SON.

Amongst limited competitions has been that for Leeds Training College, in which the assessor, Sir ASTON WEBB, placed in order of merit the designs of Mr. G. W. ATKINSON, Mr. ALBERT E. KIRK, Mr. SYDNEY D. KITSON, Mr. W. PEEL SCHOFIELD, Messrs. PERCY ROBINSON & W. ALBAN JONES. For the new home of the Institution of Civil Engineers, to cost 100,000*l.*, the designs of Mr. JAMES MILLER were selected in limited competition. In the local competition for the extension of Oldham Town Hall Mr. G. A. WILLOUGHBY, the assessor, placed first the designs of Messrs. TAYLOR & SIMISTER; second, that

AT BRERETON GREEN, SANDBACH.

of Messrs. WINDER & TAYLOR; third, that of Messrs. JENKINS, MATLEY & MILLS. The limited competition for the new Examination Hall of the Royal College of Physicians and Surgeons was won by Mr. ANDREW N. PRENTICE. Mr. TEMPLE MOORE, the assessor, decided a limited competition for the Canon Greene Memorial Church and Parish Hall, Clapham Common, in favour of Mr. H. P. BURKE DOWNING. Other limited competitions were that for the East Anglian Institution for Blind and Deaf Children, Gorleston-on-Sea, in which Mr. BURKE DOWNING, the assessor, awarded the first place to Mr. JOHN E. BURTON, the second to Messrs. JOHNS & BROWNE, and the third to Messrs. OLEY & HAWARD; that for Stockport Library, which resulted in Messrs. BRADSHAW & GASS being placed first, Mr. JOSEPH HOLT second, and Mr. G. H. WENYON third; that for Council offices at Sheringham, where Messrs. STANLEY SIMONS & Co. were first, Mr. F. ENDELL ROSSER second, and Mr. F. R. SCOTT third; whilst that for Airdrie Town Hall resulted in the success of Messrs. JAMES THOMSON & SONS, first, Messrs. GEORGE ARTHUR & SON, second, and Mr. A. DANSKIN AITKEN, third.

There have been several competitions for school buildings, the most active class of architectural work at the present time. Some of these were open, some limited, and included Linthorpe Council Schools, Middlesbrough, Messrs. OLIVER LEESON & WARD being the assessors, and the premiated competitors Mr. JAMES FORBES, Messrs. R. LOFTHOUSE & SONS, Messrs. BOTTOMLEY & WELLBURN, Mr. A. FORRESTER; Elementary School, Byron Street, Macclesfield, won by Messrs. WHITTAKER & BRADBURN; United Methodist Church Schools, Cradley Heath, with Messrs. HICKTON & Farmer first, Messrs. BAILEY & MCCONNALL second; Kimberworth Schools, assessed by Mr. E. R. ROBSON, who awarded Mr. J. E. KNIGHT the first premium and Messrs. WILLEY & JENKINSON the second; Secondary School, Peterborough, where Mr. JOHN W. SIMPSON placed in order of merit Mr. BROWN RIGG, Messrs. HENRY TANNER & GREEN, Mr. G. H. V.

GOULD, Messrs. CHEERS & SMITH, Messrs. PACKER & OREWITT, Messrs. RUSSELL & COOPER; Watford Grammar School, which Mr. ERNEST NEWTON assessed in favour of Messrs. RUSSELL & COOPER, first, Messrs. SPALDING & MYERS, second, Mr. C. P. AYRES, third; Elementary School, Pontefract, where Mr. SYDNEY D. KITSON, the Assessor, selected the design of Messrs. TENNANT & COLLINS for first place, that of Mr. JAMES FORBES for second, and that of Messrs. W. H. THORP & SON for third; Council School, Middlesbrough, where Messrs. T. MELLARD REEDE & SON, the assessors, gave the leading positions to Messrs. CLARK & MOSCROP, Mr. J. FORBES, and Messrs. KITCHING & LEE; Elementary School, Winchester, where Mr. G. E. BOND was the assessor, and the premiated competitors Mr. A. H. JOHNSON, Mr. J. B. JONES, and Messrs. B. D. CANCELLOR and EDWARD STOCKWELL; Saltburn Secondary Schools for Girls, for which Mr. PAUL WATERHOUSE, M.A., the assessor, awarded the premiums to Messrs. RUSSELL & COOPER, Messrs. F. J. EEDLE & MYERS, and Messrs. EVANS & SON; Harvey Grammar School, Folkestone, where Mr. E. FINN was first, Mr. E. J. SHREWSBURY second, and Messrs. HALLIDAY & PETERSON third.

Amongst other competitions decided, that at Wood Green, Middlesex, for public baths was assessed by the late Mr. A. HESSELL TILTMAN, who placed first Mr. HAROLD BURGESS, second Mr. E. HARDING PAYNE, and third Messrs. F. J. & F. DANBY SMITH. Mr. EDWIN T. HALL was the assessor for Herne Bay Pier Pavilion, and placed first the design of Mr. PERCY J. WALDRAM and Messrs. MOSCROP, YOUNG & GLANFIELD, and gave the second place to Mr. STANLEY C. RAMSEY. For a Congregational Church at Endcliffe, Sheffield, Mr. CHARLES HADFIELD was the assessor, and the premiums were awarded to Messrs. MORGAN & BRACE, Messrs. W. WADINGTON & SON, Messrs. WITHERS & MEREDITH. In the competition for business premises for the Leeds Industrial Co-operative Society the first premium of 100l. was awarded by the assessor, Mr. F. E. L. HARRIS, to Messrs. BRADSHAW & GASS, the second, 50l., to Messrs. LA TROBE & WESTON, and the third, 25l., to Messrs. THOS. NEWBY & SON. For a branch library for Walton and Fazakerly, Liverpool, Mr. W. E. WILLINK, the assessor, placed first Messrs. BRIGGS, WOLSTENHOLME & THORNELY, second Mr. R. WYNN OWEN, third Messrs. T. T. REES and F. B. HOBBS. Messrs. LEEMING & LEEMING adjudicated in the competition for municipal buildings at Denbigh, and awarded the premiums to Messrs. POTTER & ELCOCK, first, Mr. A. FAIRDALE, second, Messrs. HUGH MACKINTOSH & NEWMAN, third.

HONOURS

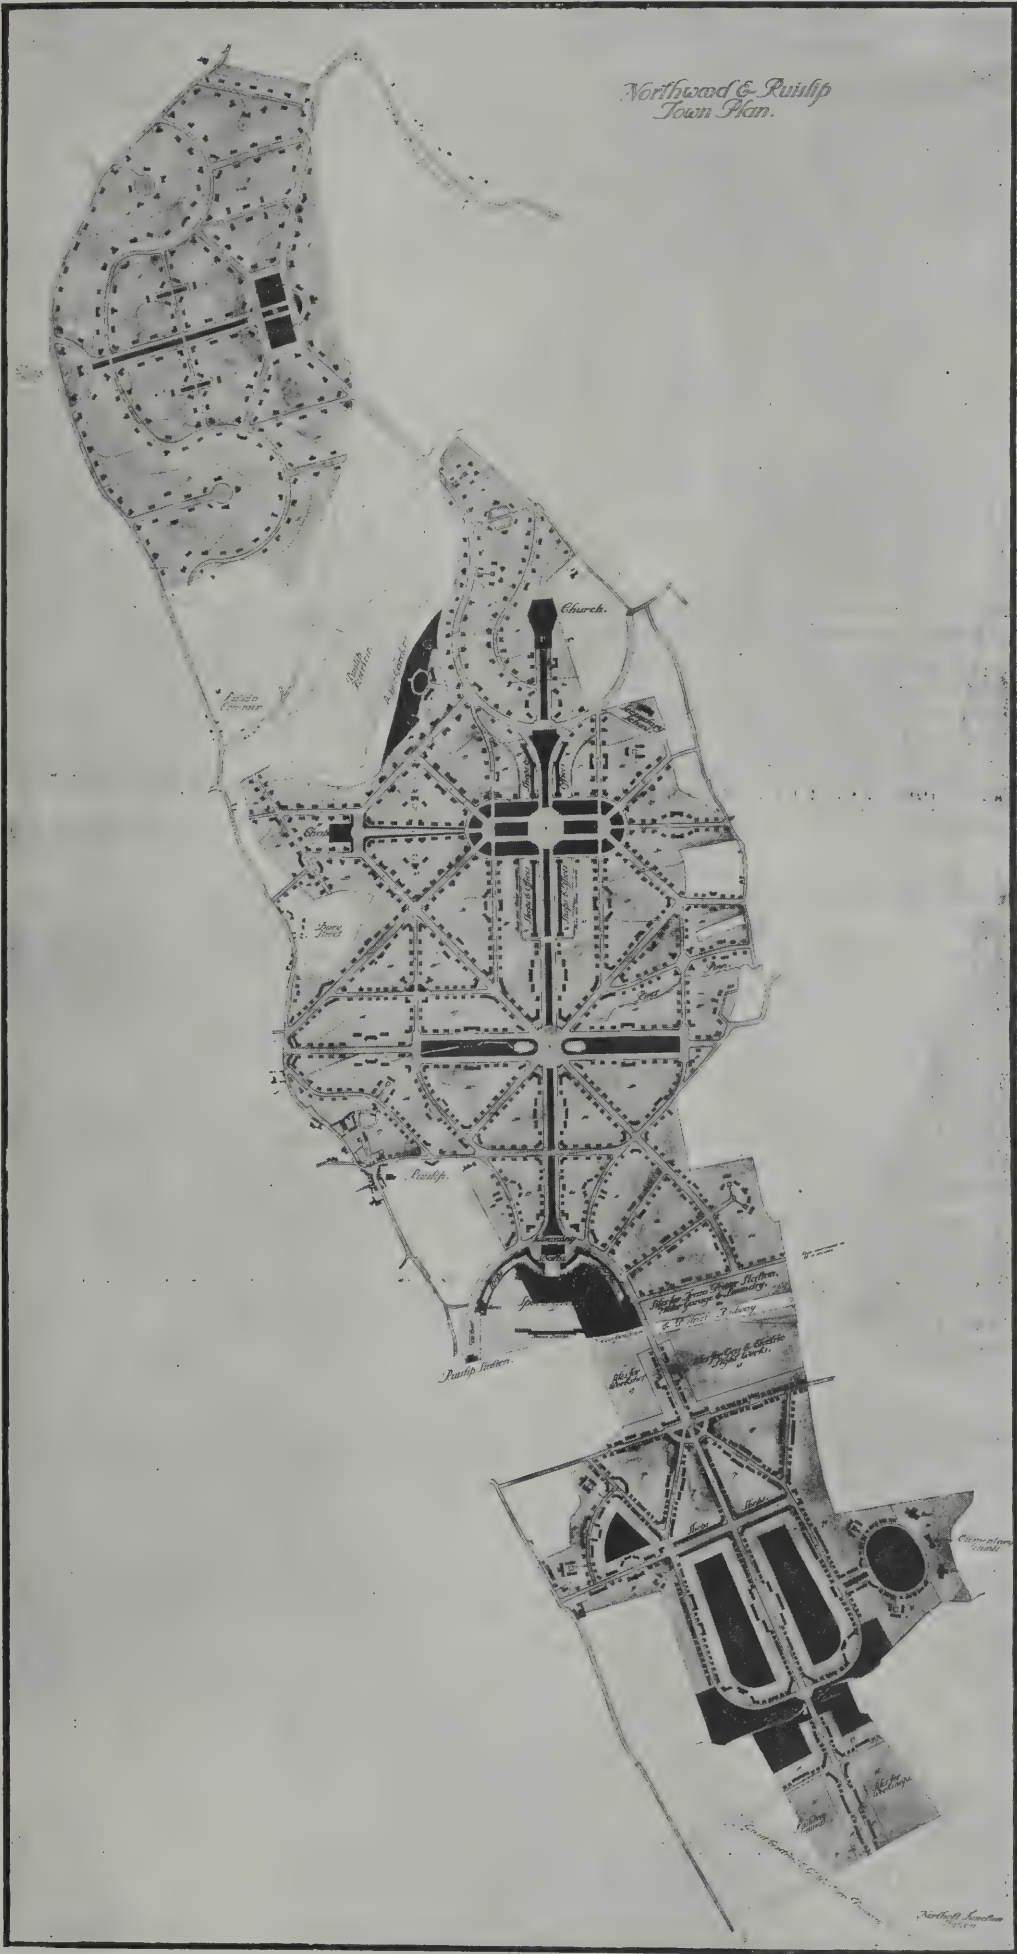

obtained by architects during the past year include a Knighthood for Sir ALEXANDER ROSE STENNING, F.R.I.B.A., and past president of the Surveyors' Institution; the award of the Royal Gold Medal to Mr. T. GRAHAM JACKSON, R.A., who also received from Cambridge University the honorary degree of LL.D. Mr. THOMAS ROSS, F.S.A., received a similar honour from Edinburgh University, and Mr. J. J. BURNET, A.R.S.A., from Glasgow University. Mr. ERNEST GEORGE has been elected an Associate of the Royal Academy of Arts.

OBITUARY.

The ranks of architects have been decreased during the past year by the decease of Mr. BENJAMIN TABBERER, Mr. ROBERT WALKER, Mr. A. BURNELL BURNELL, Mr. HENRY JARVIS, Mr. GEORGE THOMAS, Sir THOMAS DREW, Mr. E. SHEWBROOKS, Mr. CAMPBELL DOUGLAS, Mr. WILLIAM OWEN, Mr. GEORGE AITCHISON, Mr. H. L. FEDDEN, Mr. T. J. BAILEY, Mr. H. SPALDING, Mr. M. H. HOLDING, Mr. W. BANKS GWYTHYR, Mr. A. HESSELL TILTMAN, Mr. J. MANDER, Mr. W. COPPARD BANKS, Mr. J. T. CHRISTOPHER, Mr. T. H. HITCHIN, Mr. H. J. TREADWELL, Mr. F. HEALEY, Mr. W. HALE, Mr. R. SELDEN WORNUM, Mr. JOHN YOUNG, Mr. W. S. R. PAYNE, Mr. A. E. PEARSON, Mr. E. BOARDMAN, Mr. C. HODGSON FOWLER.

RUISLIP MANOR COMPETITION.—Second Premiated Design by Mr. GEORGE HORNBLOWER, F.R.I.B.A.

RUISLIP MANOR COMPETITION - Third Premiated Design by Mr. H. R. GARDNER

RUISLIP MANOR COMPETITION.

AS we announced last week, the premiums in this, the first really important town-planning competition in this country, have been awarded to: First, Messrs. A. & J. SOUTAR; second, Mr. GEORGE HORNBLLOWER, F.R.I.B.A.; third, Mr. H. R. GARDNER. It is remarkable that none of these gentlemen have been amongst those who have delivered lectures or read papers during the town-planning boom of last year. Nor have they taken a prominent part in conferences, or written letters to the *Times*, or drawn parallel straight lines on the map of London and sent the result to a Sunday newspaper, or even, as far as we are aware, made a suggestion for a KING EDWARD Memorial. Hence they cannot, of course, be acknowledged as "experts" in town-planning. They are merely the men who, at the first time of asking, have, in the opinion of Sir ASTON WEBB and Mr. RAYMOND UNWIN, designed a new English town of some 40,000 inhabitants better than anyone else has done.

It would appear from the character of the designs that have received premiums that Sir ASTON WEBB and Mr. RAYMOND UNWIN consider that the first essential of a good town plan is that it should form a pretty and symmetrical pattern on the map. If the town were to be laid out on a level plain, like some American cities, its streets might as well be so disposed as not, but the estates of the King's College of Our Lady of St. Nicholas of Cambridge, in the parishes of Northwood and Ruislip, in the County of Middlesex, on which the new town is to be built, are anything but level, and the Copse Wood area on the north is particularly hilly, with slopes in some cases as steep as one in eight, and the first thought of every experienced estate-planner would be that this was a case in which very careful consideration should be given to contours.

The authors of the first premiated design have dodged some of the most difficult slopes by leaving them as wooded hillsides, and have then laid out their very pretty and symmetrical road plan, regardless of contours. This looks very nice and architectural on the map, but when the town is built who is going to see the pretty patterns except from an aeroplane or dirigible? And even from an aerial point of view the symmetry will be marred by one-half of a pattern running uphill and the other downhill, with roads curved in profile although straight on plan.

We are bound to assume that the roads shown on the plans of competitors will follow fairly closely the natural surface of the land, and that difficulties of level are not to be overcome at great expense by drastic cutting and embankments.

Although, as we have said, the winners have evaded the most difficult slopes, we still find a main road with a gradient of one in fourteen, others that are nearly as steep, and sewers that run uphill if, as they ought, they follow the roads.

But there are other things besides levels to be considered in planning a town. Ruislip Manor will be inhabited almost entirely by those whose daily occupation is in London, and whose primary thought is catching the train. From this point of view there is little fault to find with the selected design. The dwellers in the new town are not to be very religious, four churches only—so described, possibly a fifth is intended—being provided for 40,000 souls. We do not think the Bishop of the Diocese will approve the selected plan of the town, and other communities besides the Anglican Church will want places of worship. Most of the children will have to go to boarding-school or make long railway journeys every day, as there are only two schools for some 25,000 children. If the grand place near the reservoir is intended to be surrounded by shops, the shopping centres would be sufficient in number, though this place and the so-called market-place are not as central as is desirable. The open-air recreation spaces are ample and well distributed, but the inhabitants of the new town are expected to stay at home in the evening or run up to London for amusement, as one club and one library would not accommodate a large proportion of the seven or eight thousand householders.

No fire-station nor police-station is shown, unless the "public buildings" in the market-place are devoted to these purposes, and then they are in the wrong place and four miles from the other end of the estate.

The number of houses proposed by Messrs. SOUTAR is 7,642, of which 3,556 are not to exceed 30l. rental, 3,541 are between 30l. and 60l., 524 between 60l. and 100l., and 21 are to be of rentals exceeding 100l. We think, having regard to the distance of the estate from London, that these proportions are radically wrong, whilst the number of houses must be materially diminished to provide the other essential components of a town.

Thus the winning plan is a pretty piece of pattern-designing, but not a town plan, whilst its symmetry is only obtained by a disregard of natural conditions. For example, the river Pinn is to be metamorphosed into a highly formal ornamental water; the only high-road now on the estate, a typical Middlesex road, is to be diverted and straightened out; the Yeading brook, which at present is liable to floods, is to be abolished somehow, and the market-place built over it. On the other hand, the retention of the wooded heights and the disposition of the centres of interest are good points in the plan.

The second premiated design, by Mr. GEORGE HORNBLLOWER, F.R.I.B.A., is also an example of the pretty pattern type, as may be seen from our illustration, but not so pretty as that of Messrs. SOUTAR. The main road from Northwood to Northolt Junction is well laid out, but the suggestion of a tramway route for this and the cross-road between points G and H is a mistake, as trams, except along a shopping thoroughfare, reduce the letting value of property by 20 to 50 per cent. Some of the gradients of this road at the northern end of the Park Wood area are too steep. We like the planning of the Copse Wood area, although the adoption of the road across the golf-course suggested by the promoters is more detrimental than Messrs. SOUTAR's treatment. Some of the gradients in this area are severe. We gather from the plan that the Copse Wood area is to be devoted to detached houses of high rental, and that on the other areas the rental value of the houses gradually diminishes from the north to the south end of the town, which we think is a correct distribution. A fault in the design is that a considerable number of the houses face north and south, which from the shape of the estate might easily have been avoided.

Mr. H. R. GARDNER, the author of the third premiated design, has also produced a pretty pattern, but we cannot imagine how the assessors could consider a town of 40,000 inhabitants to be properly planned as the highly organised independent entity suggested in the instructions with one church, one chapel, one secondary school, one elementary school, and only two shopping centres in a length of four miles. Nor do we think that a pretty pattern compensates for a main road with a gradient of one in eight. Continental town planners consider that one in thirty is the maximum gradient which should be allowed in main roads, and that even this means an expenditure of three times the power in haulage of that required on the level.

At the time of our visit no bird's-eye perspectives were on view of any of the three premiated designs. These drawings were optional in the competition, and presumably were wisely withheld by the winners of premiums, for if truthfully drawn they would have utterly spoilt the value of the symmetrical patterns drawn on the flat.

None of the other competitors have reached the excellence in pattern design of the premiated plans, but many have good features as town plans. Several have by connecting the Copse Wood and Park Wood areas, immediately north of the reservoir, enforced a roundabout route to Northwood Station.

Mr. GEOFFREY LUCAS is one of these, and has also introduced an expensive and scarcely necessary feature in a bridge over the reservoir. The key-note of his plan is a main route, with squares at intervals, in which public buildings are to be erected. He suggests tramways, the objection to which we have already stated. Too many of the houses have north and south aspects.

6 feet 9 inches above the floors throughout the Sorting Office block, except to the basement, and the lavatories and staircases are tiled from floor to ceiling. The floors generally are of maple blocks.

The interior of the public office and the entrance halls have been more lavishly treated than usual, this being the largest and the principal public office of the kingdom, while the building is the largest letter-sorting office in the world, exceeding that in New York by some 90,000 feet sup. The walls are lined with Arni Alto, a veined Italian marble approaching white, with panels, dado, and door architraves of Irish green, while the caps, bases and key blocks to the window arches are of kupronised plaster. The telegraph writing tables are constructed of bronze with plate-glass writing slabs and panels. The woodwork generally is of wainscot, oiled and well rubbed.

There are few fireplaces, as the building is warmed generally by hot water, steam calorifiers being placed in six positions in the basement. There is a fresh-air inlet to each radiator when against an outside wall, and consequently the air passes into the building over the radiator. There are four boilers, each 30 feet by 7 feet 6 inches diameter, with automatic feeds. In regard to ventilation, there are extracting fans placed in chambers on the roof, each of the lower floors having separate fans.

The lifts, fourteen in number, are actuated by electricity, as is also the system of conveyors, chiefly endless bands, which transfer bags and letters to and from various parts of the building. Metallic filament lamps are used throughout for lighting. The current required is generated at the Post Office power station at Blackfriars, and there is a sub-station in the basement of the new building for reducing the current from 6,600 to 440 volts for power and 110 volts for lighting purposes.

The drainage is entirely of cast iron, suspended from the basement ceiling, and there is no drainage to basement, which is below the sewer level. The water mains and heating pipes are similarly suspended.

The floor area is 467,000 square feet, or about 10½ acres, while the old Post Office has but 158,000 feet. The cubic content of the building is about 9,000,000 feet.

Having had experience of several methods of procedure in regard to reinforced concrete work, Sir Henry Tanner said he could come to no other conclusion than that the method pursued in the case of the new General Post Office is by far the best. It was of the greatest possible advantage that the architect and the engineer should be able to work together, and this cannot be done when designs and tenders are called for. Besides, it is obvious that with such procedure, if the engineer and his contractors are to hope for any success in competition for work, the steel and concrete must be cut down to the minimum, thus increasing the chances of failure. Much time is lost in the necessary examination and comparison of the designs submitted, and this, with vacant sites, means the loss of more or less money. Such a course is not taken with ordinary steel construction, and it is not usual to ask architects for designs and tenders which would practically amount to the same thing. Moreover, under such a system it is impossible to obtain a satisfactory schedule from which variations can be properly valued.

The time must come when reinforced concrete will be incorporated in the ordinary bills of quantities and dealt with in the same way as any other part of the construction, and there are now any number of contractors quite able and willing to undertake and to carry out such works in a satisfactory manner.

With regard to materials, cement can now be regularly obtained to take a stress of 20 per cent. greater than the British standard, and this should be taken into consideration. Such cement was used throughout the G.P.O. building and in the test blocks.

In regard to expansion and contraction, these were only observed when the building was considerably advanced, but without windows and internal warmth, and therefore entirely exposed to the outside temperature. In January 1909 there was a severe frost, and contraction was evident at the eastern end of the bridge, and in the sub-ground floor at the rear of the front building, but on the return of warmer weather the fractures closed, and have not caused any trouble since the building has had the windows in and been otherwise protected. No special provision was made for expansion and contraction, and no movement has been observed in the area of floors.

Supervision is of the first importance, and this is necessary during the whole time that concrete is being mixed and deposited, and before the latter is done it is absolutely necessary to see that wood shavings, sawdust, &c., are re-

moved from the false work, and hosing is very useful for this purpose. The positions of the steelwork must be observed, as any loose parts may get out of position; column links are particularly open to this, and such loose parts should be tied together with binding wire. To ensure so far as possible the accurate carrying out of the work in this case, three Clerks of the Works were employed during the greater part of the time.

Lieut.-Col. Sir M. NATHAN, G.C.M.G., opened the discussion with a vote of thanks to the lecturer. Some forty years ago, he said, Sir Henry Tanner joined the Office of Works, and it is twenty-five years since at York his first post office was erected. For twelve years he prepared the designs of every post office building of importance, and during that time the leading characteristic of his relations with the department was his willingness to meet all their requirements when he was told of them. He always realised that a building should be arranged for the work to be carried out in it, and not the work suited for the building. In other words he was a first-rate planner. His excellent planning was evident from many buildings, including the Mount Pleasant office, and in the big block erected a few years ago in West Kensington for the Savings Bank. The great feature of the new General Post Office was the boldness in having applied a comparatively new system to a structure bigger than anything to which it had been previously applied—at any rate in this country. The details recalled to the speaker an experience of his own when as a subaltern in India he was called upon to design and construct a heavy gun battery on a very treacherous foundation. He designed a raft of concrete; and as it was essential there should be no settlement of any part of their foundations he decided to embody a large number of contractor's rails. It was a very far cry from that rudimentary idea to the elaborate arrangement described in the paper, which was the latest achievement in architectural engineering. They in the Post Office service hoped that the achievement would be followed by many other buildings designed by Sir Henry Tanner, and they hoped that all would be as successful.

Mr. H. D. SEARLES-WOOD remarked that the architectural profession at large were very much indebted to Sir Henry Tanner for the way in which he had allowed the General Post Office to be inspected. It had been a most educational building during the past few years.

Professor BERESFORD PITE considered that the new General Post Office had completely justified the confidence felt by the profession as to the works carried out by the Office of Works, and their belief that the interests of the nation, so to speak, were in entirely satisfactory hands. While they might have felt some amusement at the way in which Sir Henry was able to treat the London Building Acts, there was never any doubt about his ultimate success. To have had an opportunity of conducting an experiment of this sort and of carrying it to a success was the crowning-point of a successful career. The new post office will form a landmark in the history of English building construction and will establish Sir Henry Tanner's reputation. The possibilities of expansion and contraction with such an homogeneous building seemed to him somewhat serious. Mention was indeed made in the paper of one spot where contraction was noticed. The question became a matter of some importance if English architects began to consider the advisability of employing a ferro-concrete system in a hotter climate than their own. The gigantic letter-box under discussion had comparatively no architectural interest apart from its structure. It does not stand as Sir Robert Smirke's building stands, as the last expression of an æsthetic movement, for the elements of architectural interest have not entered into it. It would be regrettable if anything in the future were done to in any way deprive the City of the solemn and spacious Greek front at St. Martin's-le-Grand. The two represent different ideals and a different sort of architectural training. Food for thought is offered when one considered that the occasion will arise when something more than ferro-concrete construction will be demanded, something calling for a high artistic ideal founded upon antiquarian study.

Sir ASTON WEBB, R.A., congratulated Sir Henry Tanner very much on the building. It was a perfect revelation of the change in the ways. If architects in general are to carry out what Sir Henry carried out they will have to revolutionise all their ideas of building construction. It was a wonderful achievement and a wonderful paper, and the Institute was greatly indebted to him for giving all the information. It was to be hoped that next time Sir Henry was designing such a work he would be able to carry out his building to the street. It is obvious that eventually that

Messrs. WILLS & ANDERSON also show an indirect approach to Northwood Station. Their plan has many good practical points, with due regard for contours, but is not pretty enough for this competition.

Messrs. HARVEY & HARVEY give full respect to the contours, especially in the Copse Wood area, but although they provide a good civic centre their main roads straggle unduly.

Mr. E. C. P. MONSON has a through route with a central park and two shopping centres with radiating and concentric roads. We fancy some of his gradients in the Copse Wood area are rather steep.

Messrs. LOVELL & BULMAN make a bold attempt at symmetry, but there are too many parallel roads running east and west.

Messrs. EDWIN T. HALL & E. STANLEY HALL have cleverly combined a sinuous main road with a symmetrical plan employing elliptical parallels, and they have had full regard for contours. The plan is perhaps scarcely of a sufficiently garden-city character. This is one of the few designs illustrated by a good bird's-eye perspective.

Messrs. COURTAULD & COLDWELL have rather a good plan, but not organic enough.

Messrs. PEPLER & ALLEN have adopted a winding main road with shopping centres upon it, but their plan is rather sprawling. They have adopted a serpentine disposition of roads in the Copse Wood area which fits in well with the difficult contours.

Mr. F. SELBY has a good main thoroughfare through the estate, leading to a square in which are placed council offices, public hall, and library, and from which are radial roads. He has a good connection from the north of the Park Wood area to Northwood Station.

Messrs. WILLIAM H. THORP & SON have produced a pretty plan, but a disregard of contours results in some difficult gradients.

Mr. ARNOLD S. TAYLER similarly reaches the same result from the same cause in attempting a symmetrical plan.

Messrs. WOOD & HENDERSON have achieved symmetry, but show too large a proportion of houses with north and south aspects.

Messrs. R. S. AYLING and C. G. BOUTCHER, with Messrs. M. A. PIERCY and C. BOLLAM, have adopted the idea of a bridge across the reservoir, but by thus connecting the Copse Wood and Park Wood areas render indirect the approach to Northwood Station. A disregard of contours results in a road gradient of one in eight.

Although Messrs. PERCY B. TUBBS and L. A. DUNNINGTON have given due consideration to contours some of their sewers seem to run uphill.

Mr. W. H. ANSELL has taken the bold step of suggesting a new station at Ruislip, which would scarcely meet with favour.

Although we have criticised somewhat severely the selected plan, we recognise that it has many good points, and its faults are not irremediable. As will be seen from our illustration, it is distinctly of the modern American rather than the German school. Its execution obviously requires a scheme under the Housing and Town-Planning Act to conserve its symmetry and pretty pattern, and in this respect fits in with the intention of the Ruislip-Northwood Urban District Council to frame a scheme for a town plan of between 3,000 and 4,000 acres, but this scheme must start from the Ruislip Manor plan.

We are indebted to the directors of "Ruislip Manor, Ltd.," for permission to publish illustrations of the premiated plans.

THE Swansea Harbour Trust have adopted a report from Mr. A. O. Schenk (the engineer), on the damage done by the recent storm to the parapet wall of the King's Dock sea embankment, and recommending the carrying out of repairs, and of the construction of works necessary for preventing further damage from the wind and sea. The estimated cost of the works proposed is from 14,000*l.* to 15,000*l.*, and the contract has been given to Messrs. Topham, Jones & Railton, the contractors for the construction of the dock.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN ordinary general meeting of the Royal Institute was held on Monday last, Mr. Leonard Stokes, President, in the chair. The decease of the three following members was announced:—F. W. Peel (Fellow), C. Ashton Callon (Associate), and F. W. Roper (Associate). Sir Henry Tanner, I.S.O., F.R.I.B.A., was then called upon to read his paper on

The New General Post Office.

In 1904 part of the site of Christ's Hospital between King Edward Street and Giltspur Street, amounting to 3½ acres, was acquired from the Governors for the purpose of erecting buildings to cope with the constantly increasing business at the old General Post Office. After mature consideration the conclusion was arrived at that reinforced concrete construction was excellently adapted for the purpose, and would economise both space and money, having in view the fact that Government buildings are exempted from the operation of the London Building Acts, and that therefore full advantage could be taken of the new methods. Upon going into the matter of cost as carefully as possible, it was found that if built in the ordinary way with steel construction the approximate cost, exclusive of fittings, &c., would be 355,000*l.*, but if in reinforced concrete 295,000*l.* would probably suffice. The latter figure has proved to be correct, so that there has been an approximate saving of 60,000*l.*, and apart from this considerable space has been gained, due to the great reduction in wall thicknesses. The cost per foot cube of the reinforced concrete structure was about 2½*d.* The sum of 295,000*l.* is exclusive of engineering work, such as heating, lighting, lifts, telephones, conveyors, &c.

In February 1906 the Commissioners of Works agreed to adopt the Hennebique system, and to the employment of Mr. L. G. Mouchel to act as consulting engineer to collaborate in the preparation of the first contract, which consisted of the excavations, reinforced concrete work, and so much general work as was necessary to render the building watertight, but with the exception of the Portland stone fronts. In March 1907 a commencement was made by Messrs. Holloway Bros.

The sorting office or main block consists of six storeys, and the public office in King Edward Street of seven storeys; inclusive in each case of a basement floor and a sub-ground floor. It was stipulated that the interior columns were to be as few and as small as possible, in order to give the largest practicable unobstructed areas, that the beams were to be of the minimum depth, that there must be a bridge of 50 feet span connecting the two buildings at the second-floor level, and that two subways were to be constructed under King Edward Street, connecting the new building with those existing. The superloads were fixed after experiment at 1 cwt. for the ground floor and ¾ cwt. for the remaining floors, 65 lbs. for the roof, and the factor of safety at 4.

The excavation was of considerable dimensions and some 30 feet deep. Digging was commenced at King Edward Street, as also was the building, and work progressed to the westward. A portion of the old London wall ran through the site. It was impossible to save it, except a portion under the western yard, without sacrificing a large portion of the two lower floors. In addition there were the very heavy and solid foundations of Christ's Hospital, and even earlier buildings, and blasting had to be resorted to.

In order to construct the main beams and allow for the extension of the bars into the adjoining beams, the excavations had to be of great width, and the sides were supported by timber piles and heavy timbering. The work proved reasonably watertight; nothing whatever has passed through the retaining walls, which average 7½ inches thick. There is no asphalt lining, but ordinary cement concrete, 8 to 1, several inches thick was used for filling up the space occupied by the false work at the back of the walls. Some trouble was, however, experienced in keeping the ducts dry where the building was on the clay. This difficulty has, however, been overcome by forming two sumps and taking a drain from them into the outcrop of the gravel.

The second contract consisted of the Portland stone and granite work, and the third contract the remainder of builder's work, including internal brick divisions, joinery, plastering, tiling, sanitary work, painting, &c. These two contracts were also carried out by Messrs. Holloway Bros.

Experiments were made with various plastering materials for internal work, and as a result a rendering of Portland cement and sand, finished with Keene's, was used. This so far has proved quite satisfactory, and except for the ceilings in the offices above the public office, which have been distempered, the whole has been painted with enamel finish.

The wall tiling of glazed fireclay ¾ inch thick begins from

must happen, and the building will have to be treated as a street frontage. Sir Aston said he was sorry (for some reasons he was also glad) that he was not the young man to have to do it. He trusted that Sir Henry Tanner would have an opportunity of showing how this concrete building can be continued forward and honestly turned into architectural effect. In Paris very successful façades have been of concrete. It should act as a great incentive to modern young men to know that there is this problem of employing this material and giving it an architectural character. How it was to be done he himself did not know. He had, in conclusion, great pleasure in joining his thanks to those of the rest of the audience to Sir Henry Tanner for his able paper, which would be one of the epoch-making ones in the history of the Institute.

Mr. MAX CLARKE described the new General Post Office as undoubtedly the greatest object-lesson of ferro-concrete work in the United Kingdom. It was particularly useful at the present time when the regulations for ferro-concrete were under consideration. Of course, Sir Henry Tanner was able to do a great many things which it could not be anticipated would be allowable to ordinary architects designing non-Government buildings. It appeared to be a most remarkably cheap building. The architect was to be congratulated on his audacity in calculating the superload for the ground floor at 1 cwt. The best thing in designing such a structure seemed to be to pay no attention to the London County Council regulations. He would like to ask why Sir Henry had adopted a calculation with regard to the cement different from the British standard specification. And did his alteration apply absolutely to ferro-concrete? An ordinary architect in such matters is bound to adopt something which people who know more about that particular subject than himself agree upon. Most architects so regard the standard specification. Yet here they were told about a large and important building which had no reference to it. He would also like to know whether the concrete was put in wet or dry, because whereas it was quite a simple matter to put in dry concrete when the rods are close together, it is more difficult when they are not. Emphasis had been rightly laid on the extraordinary amount of care necessary to prevent wood chips and shavings getting into the columns. The Kodak Building in America fell because wood was allowed to destroy the cohesion. There seemed, on the whole, a considerable amount of luck in ferro-concrete work, and luck had favoured Sir Henry Tanner.

Mr. KNIGHT spoke of the importance of fineness in the cement used for reinforced concrete building, and also of the high value of the crushing test of concrete. He hoped that in his next building of this class Sir Henry Tanner would give them an elevation of reinforced concrete. It was a material with which a design aesthetically as sound as in any other material could be carried out. If Sir Henry Tanner had done this it would have been even more than now an epoch-making building.

Mr. J. E. FRANCK thought that Sir Henry Tanner was to be congratulated on having a board who would carry out his wishes. The Royal Institute were also to be congratulated on their report on reinforced concrete, which has been of very great advantage to engineers, as it can be taken about and easily referred to. The late Mr. L. G. Mouchel was a very able engineer, and a pioneer of reinforced concrete in this country; in addition, he was a very genial companion. It was regrettable that he was not alive to see how his system had been carried out. In this country there had been a dangerous tendency to regard concrete as something which need not be made by skilled labour.

Professor H. ADAMS pointed out that in considering the low cost it should be remembered that it was of a building practically without a frontage. The structural advantages of reinforced concrete had been clearly shown. The material had so far made more headway in engineering construction than in architectural work. But when architects are able later to give closer attention to the subject they will no doubt use it more. On the face of it, the material seemed unpromising, but it was a legitimate one.

Mr. H. H. STATHAM said he had been inspecting the building that day, and, among other things, had noticed that one part of the building had been treated architecturally in concrete. There was a cornice with its modillions, &c., just as it would be in a stone front. It appeared to him, however, that in the future they ought to give up imitating the forms of masonry.

Mr. DE VEZIAN, speaking as an assistant of the late Mr. Mouchel, expressed regret that his chief was not alive to be present at the meeting. In alluding to doubts raised as to the effect of expansion and contraction, Mr. De Vezian

said he thought they need not have any fears as to the effects of variation in temperature.

Mr. LEONARD STOKES closed the discussion by putting the vote of thanks to the meeting. They would all wish, he said, that such an opportunity as the new General Post Office could come to each of them. That building had been erected under considerable advantages in its independence of that bugbear the London Building Act. He had been interested in the thinness of the floors, for his own experience of ferro-concrete was that it carried sound tremendously. He was also interested in seeing the chimney stack had also been carried out in it, for the only instance of the kind he knew of was giving a vast amount of trouble. They all hoped that some one will think of a new method of making a pleasing and sensible design in this new material.

Sir H. TANNER having briefly replied to the points raised, the meeting closed.

The PRESIDENT announced that the next meeting will be held on Monday, January 16, when Mr. Halsey Ricardo will read a paper on "Cardinal Medici's Pleasure House," and the Award of Prizes and Studentships will be announced.

ILLUSTRATIONS.

THE CHOIR, COLOGNE CATHEDRAL.

THIS illustration is from an etching by Mr. LAURENCE DAVIS, in communication with whom we shall be pleased to place any of our readers who may desire a copy of the original.

BROCKHURST, EAST GRINSTEAD, SUSSEX.

THIS house was originally a cottage, and has been added to and altered at various times. The present alteration, completed at the beginning of 1909 for Mr. F. J. HANBURY, consisted of an enlargement of the dining room, new staircase, the provision of a chapel, a museum, and various other minor improvements. The garden front, originally a mixture of stone, tile hangings, and half-timber work, was found to be in a very bad condition, and has now been practically refronted in stone without otherwise altering the appearance of the house. The windows have been reglazed with metal casements and leaded lights, and a stone-paved terrace and wall built of local stone replaces the original grass bank. Messrs. HOLLOWAY BROS. were the builders, and the oak joinery was also made by them. The ornamental plaster work was modelled by Mr. STEPHEN WEBB, under the architect's direction, the motif for that in the dining room being the orchid, of which flower Mr. HANBURY is an ardent collector. Mr. STEPHEN WEBB also made the models for the oak carving in the chapel from the architect's drawings; Mr. MORRISON was the carver. The casements and lead lights were made by Messrs. WM. MORRIS & Co., and the ironmongery by Messrs. N. F. RAMSAY & Co. The architect was Mr. MAURICE E. WEBB, M.A., son and partner of Sir ASTON WEBB, C.B., R.A.

TRAVELLING STUDENT'S SKETCHES.

WE have pleasure in reproducing two of the sketches made by Mr. CHAS. HENRY WALSH, the first holder of the travelling studentship given annually in connection with *The Architect Students' Sketching and Measuring Club*. We shall publish further drawings by Mr. WALSH in subsequent issues.

CANADIAN ARCHITECTURE.

IN the Dominion of Canada there is even less of anything that can be called ancient architecture than is represented by the "Colonial" period in the United States. Our *confrères*, therefore, have had to start *ab initio*, and anything approaching a general national treatment is still in the future. Thus Canadian architecture of the present day is based upon an eclectic use of motifs borrowed from Europe, or from such modifications of European work as may be found in the United States.

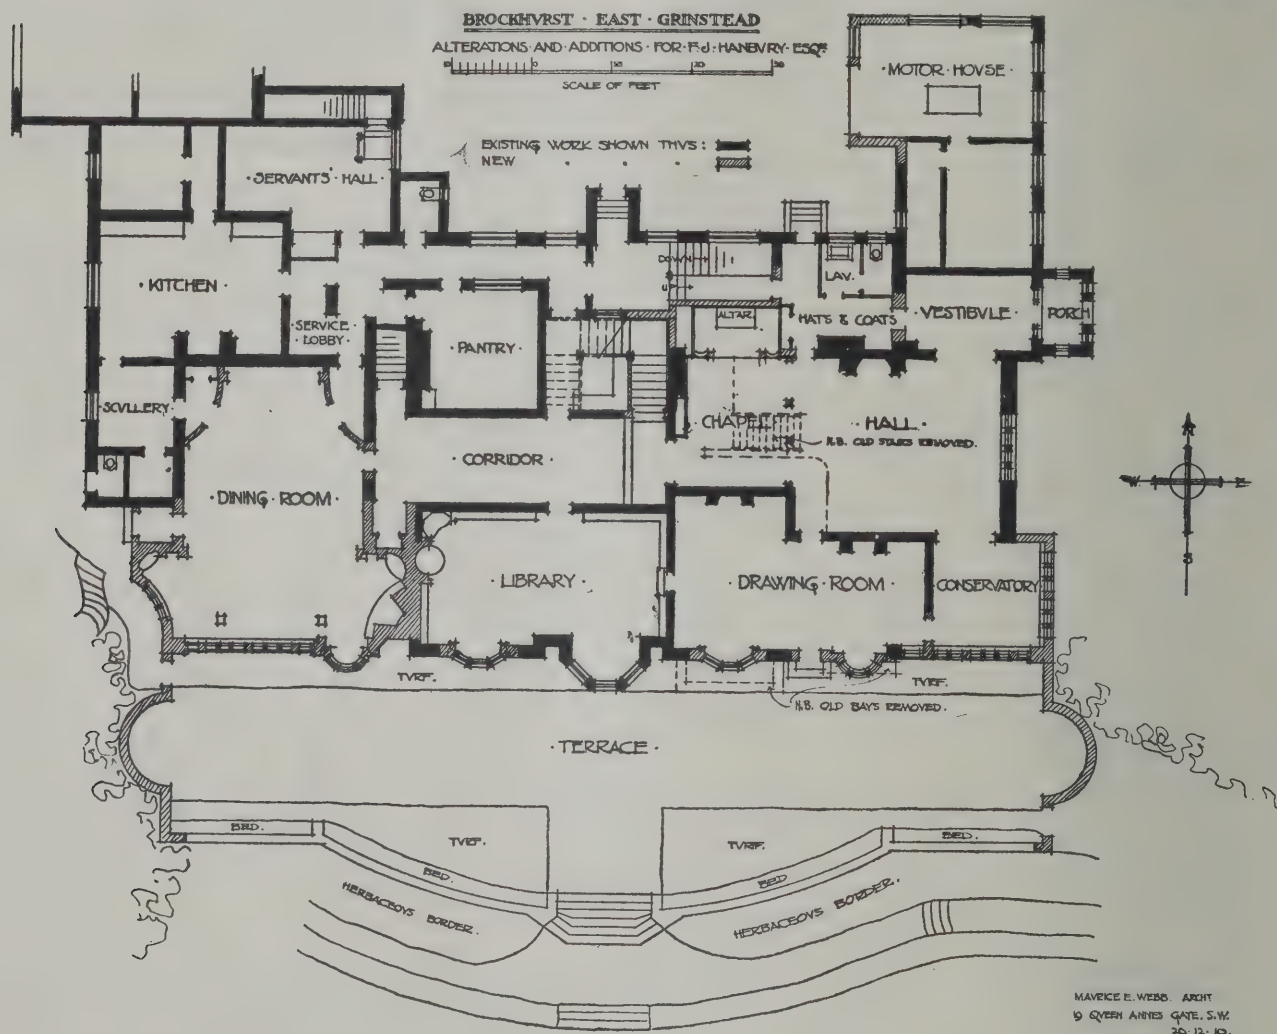

As regards public buildings, our brethren in Canada have suffered from three adverse influences: first, an undue preference given to some of the well-known architects in the States over those in the Dominion; second, a

disposition to entrust public work to official employés, rather than to architects in independent practice; and, third, to undue haste on the part of their employers in the phenomenally rapid development of the country, which has not left the architects sufficient time for proper consideration of their designs for monumental buildings. Hence up to the present Canadian architects in the matter of great works have scarcely had a fair show.

With domestic architecture the case is quite different. Many Canadian architects are to-day designing houses, both large and small, that worthily hold their own, in originality, in comfort and in beauty with the best class of work to be found either in England or in the States.

In the matter of building material, the development of Canada's natural resources has not kept abreast of the demand, and much has therefore been imported from the States; but there is in the Dominion no lack of brick earth and fireclay, either in the Maritime, the Central or the Western provinces, whilst the stone and marble of Canada are so excellent that they find a market even in

there a nunnery for his saintly daughter FRIDESWYDE. The nunnery was converted into a house of the Austin Canons in 1004. Upon the same site in 1525 the foundation-stone of Cardinal WOLSEY's college was laid. The Cardinal presumably hoped to avert any odium which might arise from his suppression of this Priory along with twenty-one other religious houses by dedicating his "Cardinal College" to the HOLY TRINITY, the VIRGIN MARY, St. FRIDESWYDE and All Saints. The first work to be finished was the noble kitchen, 40 feet square, with its three fireplaces. The same lordly scale was preserved throughout. The Tom Quadrangle is the largest in Oxford, being 264 feet long by 261 feet wide. The south range of buildings, including the superb hall and kitchen, together with the greater part of the east and west ranges, was completed before WOLSEY fell into disgrace four years later and his College became forfeited to the Crown. The north side was to have been occupied by a great chapel, to make room for which three westernmost bays of the cathedral and the west side of the cloisters were demolished. But the work ceased when the

Europe. Development of production and of transport is alone needed to make Canada independent of external sources for building material in the near future.

There appears to be a tendency in the Dominion for a parallel to the existing conditions in the States—the growth of large practices, confined to a comparatively small number of firms, employing what in England would be considered colossal staffs of assistants.

We illustrate this week some of the buildings of one of the leading firms in Toronto, Messrs. DARLING & PEARSON.

OXFORD COLLEGE SERIES.—CHRIST CHURCH. EXTERIOR—QUAD.

THE St. Aldate's front of Christ Church, with its famed Tom Tower in the centre and two heavily projecting wings or bastions at each end, is one of the most conspicuous features of Oxford. The College can trace its history almost to the advent of Christianity into that part of England. In the eighth century Prince DIDAN erected

walls had reached six or seven feet above the ground. In 1546 the College was reconstituted by HENRY VIII. About a hundred years later the quadrangle was completed under JOHN FELL (Dean 1660-86), by the erection of the Dean's lodging and other rooms on the north side, the provision of a raised terrace by excavating the centre area, the lengthening of the St. Aldate's façade northwards, and the addition of a tower from WREN's designs over the entrance. In the tower was hung "Great Tom," which had been brought to Christ Church on the suppression of the cathedral church of Oseney. "Mighty Tom" has played an important part in Oxford undergraduate life since it was first tolled at 9 p.m. on May 29, 1684, for its one hundred and one strokes are the signal for the closing of the College gates. The remainder of the peal, seven in number, are hung in the bell tower, designed by Mr. BODLEY some thirty years ago, over the hall staircase. We hope to give a fuller account of Christ Church College, by Professor HAVERFIELD, in the course of a week or two.

THE ILLUMINATION OF INTERIORS.

By Professor J. T. MORRIS, M.I.E.E.

THE subject of illumination is one with which everyone is so familiar, or imagines himself so familiar, that at first sight an article on the subject may seem superfluous. But in reality there are few subjects about which so many mistaken ideas prevail. It is in the hope of drawing attention to some of these that this article is written.

PART I.

DAYLIGHT ILLUMINATION.

If a brilliant lamp be placed on a table immediately in front of ordinary reading matter, and the latter be read with the direct rays of the lamp full in the eyes, it is well known that the print, though legible, is only read with difficulty. The eye feels strained, and there is a natural instinct to screw up the eyelids to reduce the dazzling effect of the light. On the other hand, if the light be placed on one side and screened, or, better still, if it be allowed to shine over the shoulder, the print can be read with ease. In the first case the matter must have been illuminated much more brightly than in the second; yet the latter is much more satisfactory.

This shows how important it is that the source of light, if bright, should be out of the field of view of the observer, if reading or other occupation involving close scrutiny is to be done with comfort. At all costs let us

until a few years ago there was no really simple and reliable method of measuring daylight. Much of our present knowledge of illumination and its measurement is due to Mr. A. P. TROTTER, Electrical Adviser to the Board of Trade; Mr. P. J. WALDRAM has also worked in this field. Some of Mr. WALDRAM's results, and others obtained at the East London College, on the light coming from the sky and the proportion of it which enters through the windows of different rooms, are of great interest. This proportion will, of course, depend largely on the situation of the windows, colour of surrounding buildings, &c.; but, as will be shown later, it is a somewhat remarkable fact that for any particular room the ratio is fairly constant throughout the whole of the day.

If one were to hand a sheet of printed matter to a person and ask him to examine it first in an averagely lighted room and afterwards out in the open, and then ask him to state what he considered was the ratio of illumination outside to inside, it is probable that as a generous estimate he would say that the light was ten times as bright outside as in. As a matter of fact a nearer figure would be 100 to 2,000 times. If the person in question had some knowledge of photography he would know how much longer is the exposure and larger is the "stop" required for inside work. But it is doubtful even then whether he would guess anywhere near the huge figures given above.

FIG. 1.

get rid of the idea that if we "can see somehow" we can get along, because this usually means that the eye will be strained either by excess or insufficiency of illumination.

To make an accurate study of illumination it is necessary to fix a unit of measurement. This unit or standard is called 1 foot-candle or candle-foot—that is, the illumination which is produced on a surface at one foot distance by a source of light emitting one standard candle. At twice the distance it becomes one-quarter foot-candle; at three times the distance it is one-ninth foot-candle; and so on.

Light is in general required for the purpose of seeing something else, as distinct from a few special cases, such as illuminations, fireworks, &c., where the light forms a part of the spectacle. From what has been said above it will be seen that it is very desirable to arrange that all lighting should be done on the indirect system, i.e., arranged so that the lamps cannot themselves be seen. This can be done with inverted arcs, but such methods, except in special cases, are too wasteful for ordinary purposes.

Both candle-power and illumination are comparatively easily measured in a properly equipped laboratory, but

Another important point is the wide fluctuation which takes place in the light during an ordinary day; the eye is only capable of following these variations to a limited extent, and, as will be shown later, is a very poor guide with which to judge illumination. Fig. 1 shows a curve drawn from observations made in the East London College during the afternoon and evening of June 9, 1910. Table I. is a record of the readings taken.

TABLE I.

Variation of outdoor illumination in foot-candles during the afternoon of June 9, 1910:—

Time.	Reading (in Foot candles).	Time.	Reading (in Foot candles).
1.30 P.M.	3,500	7.15	110
3. 0	2,900	7.40	80
3.10	1,700	7.45	72
3.30	2,200	8. 7	13
4. 0	1,900	8.30	1.1
4.30	3,000	8.35	0.2
4.45	1,100*	8.45	0.15
5. 0	2,900	8.50	0.10
5. 5	2,700	9. 0	0.08
6.30	170	9. 5	0.02
6.35	210	9.10	0.10†
6.45	470	10.30	0.10
7. 0	150		

* Sun obscured.

† Arc lamps lighted.

Most of the fluctuations which, it will be observed, took place during the early part of the afternoon, were due to passing clouds. This subject has been specially investigated by Mr. WALDRAM, and some of his results have been published in the *Illuminating Engineer*. He has compared the various intensities under different conditions and has arranged them in the following order of decreasing brightness:—

- (1) Thinly overcast sky with no blue.
- (2) Clouds predominating.
- (3) Blue predominating.
- (4) Cloudless, either clear blue or hazy.
- (5) Dense clouds, no blue sky, no sun.

From fig. 1 it will be seen that the maximum illumination observed was 3,500 foot-candles, which, after some fluctuations, had dropped by 6.30 P.M. to one-twentieth of its value at midday, while at 8 P.M. it had diminished to such an extent as not to be recognisable on the curve drawn to the original scale. The light continued to fade till about 9 P.M. it had reached a value 0.02 of a foot-candle, in comparison with 3,500 foot-candles at midday. At 9.10 P.M. the arc lamps in the grounds were lighted, and the illumination rose to 0.1 foot-candle. It was found when making these tests that very few of these wide variations in intensity can be distinctly observed by the unaided eye unless they amount to changes of several hundred per cent. This is chiefly because they take place gradually. Calling the maximum intensity of illumination necessary for telling the time by a watch unity, an illumination 10,000 times as great would still not seem dazzling. Such facts as these demonstrate the remarkable adapting power of the eye. It is very doubtful whether any other organ of sense is capable of encountering without injury or discomfort such wide ranges.

Turning to the question of window efficiency, we meet with the striking fact that the ratio between the intensity of illumination measured in a room and that of the sky remains fairly constant. Table II. shows some results obtained at the East London College:—

TABLE II.

Time.	Internal.	External.	Ratio	Internal External	Illumination.
7.0 P.M.	1.46	750.0		0.0020	
7.20	1.42	570.0		0.0025	
7.40	0.78	380.0		0.0020	
8.7	0.16	63.0		0.0025	
8.30	0.03	5.5		0.005	
10.0	0.55	Artificial illumination.			

These figures were obtained inside the Electrical Engineering Laboratory of the College. The readings are in foot-candles. That taken at 8.30 P.M. is rather below the accurate range of the instrument, and consequently the value of the ratio 0.005 is not very reliable. The ratio obtained in this test is about the average for a well-lighted room, which, as a rule, has an illumination intensity of $\frac{1}{400}$ th to $\frac{1}{500}$ th of the external value.

The following figures given by Mr. WALDRAM for several well-known buildings are interesting, and although comparable with one another, in order to give absolute values, in the author's opinion they should be multiplied by a constant whose approximate value is 5. This matter is dealt with at greater length below:—

TABLE III.

$$\text{Ratio} = \frac{\text{Inside Illumination}}{\text{Outside Illumination}} \times \text{Constant.}$$

These ratios will remain fairly constant, whether it be bright or dull, full daylight or dusk, providing there is no direct sun on the windows.

The ratio just discussed depends largely upon that of window area to floor area. It may therefore be of interest briefly to examine what regulations have been laid down on this point. In the London Building Act of 1904 it is specified that the minimum window area allowed in a habitable room is one-tenth of the floor area.

The Board of Education building regulations (1907) specify a minimum for new schools of one-fifth of the floor area in the class-rooms, and for other rooms not less than one-eighth. The illumination must, further, be from the left-hand side of the scholars, or, where this is impossible, from the right-hand side. Lighting from the front is not permissible. It is a significant fact, however, that nothing is said about artificial illumination.

It is with the object of removing the widespread ignorance which exists as to what constitutes satisfactory illumination under greatly varying conditions—in a word, of putting illuminating engineering on a scientific basis—that the Society of Illuminating Engineers was formed with Professor S. P. THOMPSON, F.R.S., as its first President. In this society engineers, architects, medical men, and others are able to discuss these important problems in an impartial manner.

Returning to the subject of the ratio of internal to external illumination, it must be remembered that this ratio will be at once altered should any great change be made in the general colour of the interior of the room. It is common knowledge that the laying of a white tablecloth brightens up a room. The colour of the wall-paper, too, has a most marked effect, and many people who blame the architect for the bad lighting of a room are often themselves responsible because a dark coloured paper was chosen for the wall decoration.

(To be continued.)

ROWALLAN CASTLE.

ROWALLAN is situated about three miles north-east from Kilmarnock, in the county of Ayrshire, Scotland. It forms one of the many interesting examples which remain of Scotch baronial work, although, perhaps, it is not so very well known.

It is beautifully situated on a rocky knoll in the estate recently acquired by Cameron Corbett, Esq., M.P., with a clear, flowing stream in front and well wooded surroundings, and is quite near the new mansion house built by Mr. William Lorimer, architect, Edinburgh.

The house is a fine specimen of the Scottish mansion of the sixteenth and seventeenth centuries, and although quite national in its characteristics it does not bear the usual features which mark others of its class. It has nothing of the overhanging effects produced by corbelling, and little or nothing in the way of turrets, so common at this period.

The front elevation, which faces the east, has two bold drum towers which form conspicuous features. Leading up to the small arched doorway, which is flanked by the towers and forms the main entrance, is a straight flight of twenty-two steps, which form a dignified entrance to the building. The arched doorway leads through a passage into a courtyard, of which the building forms three sides.

In a panel over the main entrance are the Royal Arms and supporters, with the Mure Arms beneath, the detail of same now being somewhat lost. Above this panel is a carved head, probably intended for a "Moor's head," the crest of the family.

The bosses, string courses and mouldings of the front elevation, carved with cable ornaments and imitation gargoyles, are characteristic of the period in which they were built—1567.

There is very little of interest to be seen now internally, since most of the old woodwork has been removed. The private room or hall, has an interesting little cupboard called the "Ambry," fixed to the scuntion (on the south side) of the window at the south-east angle. It displays some very fine work in the way of old Scotch detail. There is a similar cupboard on the other scuntion, but it does not call for any comment. In this same room there is also a wood screen which displays fine workmanship and design.

"ROWALLAN CASTLE"

From a Drawing by Mr. W. A. ROBB.

"THE ARCHITECT" STUDENTS SKETCHING AND MEASURING CLUB.

The fine entrance gateway to the courtyard was built by Sir William Muir, who succeeded in 1657, and died in 1686. Over this gateway there is a shield which bears his monogram intertwined with that of his wife, Dame (Elizabeth) Hamilton. There were doubtless enclosing walls extending to the stream, of which only the fragment containing the gateway remains.

The present castle is supposed to have been built on the site of the original fortlet, which was of a much earlier period. It is recorded in the "Historie" that Gilchrist Moir, for the reward of his services to the King Alexander at the battle of Largs, in 1263, obtained the "heretrix" of Rowallan, "and bair in his airmes ye bludy heid. . . he biggit ye auld tour of Rowallance, and put his armes yair."

It was the birthplace of Elizabeth More, or Mure, first wife of Robert II., from whom our Royal family are descended, and the residence of Sir William Mure (1594-1657), a member of the parliament that met at Edinburgh in 1643 to ratify the Solemn League and Covenant; and a poet of considerable note in his day. Part of the house still bears the name of the "Auld Kirk," from the religious meetings that took place in his time.

POST-AND-PLASTER BUILDINGS IN CHESHIRE.

THE revival of "black-and-white" in modern buildings recalls the magnificent examples that are still left to us for admiration and suggestion.

To see our choicest gems preserved as of yore, we must hie away to the great Cheshire plain. Here the landscape is studded with examples which abound in interest for the architect and builder. No effort is spared to make good any damage wrought by wind and weather; the snowy-white and jet-black are replenished as the seasons come and go.

Among these relics of antiquity Little Moreton Hall, near Congleton, stands unequalled. Constant care has saved this pile from destruction. Many times have the timbers threatened and the floors quivered, but a prompt supply of struts, wedges and binders has saved the hall, and it bids fair to defy the storms of many winters.

This old home of the Moretons rears its lofty ridge above the corn fields and provides a magnificent landmark. It retains the moat of 400 years ago, spanned by a stone bridge leading to the gate-house. The islet on which the hall stands is square, with sides about 20 yards in length. The

archway is reminiscent of sixteenth-century days, when pillars of oak with carved capitals found great favour in the shires of the North. The fine panelling of the doors strikes our attention from the first. But the glory of Moreton is revealed when we enter the pebbled courtyard. Ever

THE LONG GALLERY, LITTLE MORETON HALL.

and anon we wonder where most grandeur lies. It is in the octagonal bays on the east side that admiration centres generally. Of these there are two, each of two storeys, abutting on the great hall and drawing-room, and each having

THE FAMOUS BAYS, LITTLE MORETON HALL.

three gables with painted quatrefoils. The upper storey gives a tangible clue to the age of this part of the hall. It bears the inscription in capitals:—

"God is al in al thing
This windovs whire made by William Moreton
In the yeare of oure Lorde MDLIX."

The lower storey is headed thus:—

"Rycharde Dale Carpeder made thies
Windovs by the grac of God."

centuries ago. The kitchen and bell-cot stand to the west. This block is remarkable for the private room which projects from the main part of the building. Little Moreton had several of these closets used for meditation, prayer, and seclusion. The bell is tolled on Saints' days, when divine

FIGURE OF DESTINY AT THE END OF THE LONG GALLERY, LITTLE MORETON HALL.

Besides the inscription on the upper storey there is an interlacing of carved figures, all suggestive of the doings of the Moretons and their neighbours. The fox, hare, dragon, bear's head, bull's head, and a human head are all there representing the chase, the den, the block.

The leaded windows in geometric forms are indeed unique. In the lower storey each oblong contains thirty-seven panes. There are nine windows on each of three sides, so that each lower bay numbers at least 999 panes, a magnificent achievement by Rycharde Dale or his successors.

The portico with its array of painted quatrefoils is striking. The whole structure is built of black oak and abounds in richly carved capitals and shafts. The spiral pillars by the doorway are types of the wood-worker's art

THE PORTICO, LITTLE MORETON HALL.

service is held in the small oratory chapel at the south-east corner of the quadrangle. Here is the most ancient portion of the whole building. Two small windows illumine this sanctuary; a rood-screen rises to the panelled ceiling, and texts are crudely printed on the walls.

The present "cheese-room" was in reality a secret chamber, from which a passage was dug under the moat to one of the mounds in the fields adjoining. If the hall were stormed and captured, the beleaguered occupants could escape at the last moment.

Round the lofty newel-post we ascend a winding stairway to the long gallery or ball-room. This retains its antiquated splendour in all details. The oaken floor and panelling are unscathed, save for the scratching here and there of pocket-knives and hat-pins. The room measures 75 feet by 12 feet, having an altitude of 17 feet. The cross-and-tie beams are strong as ever; and though the lateral walls bulge somewhat, stay-rods maintain the whole room in sound equilibrium.

On this floor the Virgin Queen danced with her host and courtiers. Then Moreton was at the zenith of its fame, and illustrious guests poured on the great house at every chase. Over the panelling at one end of the room is carved in plaster the figure of Fortune blindfolded, and holding aloft "The wheele of Fortune whose rule is ignorance."

front shows one of the most typical of "magpie" structures. Bramhall Hall was originally quadrangular with an enclosed courtyard. The west wing, however, was demolished in 1819, leaving thirteenth-century work on the north side and fourteenth on the south. The banqueting hall is 40 feet by 20 feet, and has a well-lighted oriel window in the centre. The private chapel contains an oak stall, brought here from the Davenport Chapel at Stockport.

The ancient right-of-way through the courtyard, mentioned by Harrison Ainsworth in "Rookwood," has long fallen into disuse. Sir William Brereton attacked Bramhall during the Civil War. He spared its retainers, but compelled them to open every box and chest and disclose the contents. His musketeers also relieved William Davenport, the occupier, of seventeen horses.

Adlington Hall is the ancient home of the Leghs, and is renowned for its "magpie" courtyard. The first portion was erected early in the sixteenth century, and a wing was added by "Thomas Leyghe and Sibbell, daughter of Sr Urian Brereton of Hondforde" in 1581. An uncommon

BRIDGE AND MOAT, LITTLE MORETON HALL.

Opposite is the figure of Destiny transfixing a globe, with the inscription, "The speare of Destinye whose ruler is Knowledge."

Diamond rings were not unknown to the Breretons and Moretons; one of their numerous guests scratched the ball-room windows with curious words:—

"Man can noe more
Know woeman's mind
by kaire
Then by her shadow
Hide ye what clothes
she weare."

In the retiring-room the fireplace is guarded by figures of Justice and Mercy supporting the arms of Moreton and Macclesfield. It was in the reign of the third Edward that John de Moreton married Margaret de Macclesfield, thus uniting two influential local families.

From Moreton to Bramhall is but a mild step. The old hall of the Davenports has been brought to an excellent state of preservation. Its glory hath not departed; and the

feature of this courtyard is that in some parts the plaster is painted black and the timbers white.

The Great Hall of Adlington was famed in times of peace and war. Handel played on its fine organ, and is said to have composed here his "Harmonious Blacksmith." During the Civil War of Charles I. 150 soldiers held Adlington for two weeks, being then forced to surrender with 700 blunderbusses and fifteen barrels of powder.

Prestbury, three miles away, has a prominent "magpie" by the high road. This is the vicarage or "priest's house" opposite the church. An open-air gallery joins the two front bays. During the troublous days of the Commonwealth the ejected minister preached from this gallery to his congregation, the doors of the parish church being closed against him. Marriages were solemnised in the house.

Chorley Hall, at Alderley, has a beautiful "magpie" wing, and though now used as a farmhouse its ancient dignity is well maintained. It dates back to the sixteenth century, when William de Honford lived at the hall. Then the courtyard was complete, and the building was sur-

rounded by a wide moat spanned by a double-arched bridge. This wing still retains a fantastic overmantel and some elegant carving.

of the original building erected by Uryan Brereton in 1562 remains unblemished. Where the brick casing is in evidence it is painted to harmonise with the ancient struc-

HANDFORTH HALL.

At Gawsworth, on the Macclesfield-Congleton Road, is a celebrated piece of "post and plaster." The Old Hall has seen days of stress and storm, and has suffered in consequence. It was the home of Lady Mary Fitton, Queen Elizabeth's maid of honour—Shakespeare's "Dark Lady."

ture as a whole. The "bear's head" of the Breretons appears over the doorway; it is the same crest which is seen in the "magpie" on Brereton Green.

With the growth of garden "cities" and "suburbs" the preservation of these ancient halls and homesteads becomes

WARBURTON CHURCH, CHESHIRE.

The old vicarage—also half-timbered—stands on the opposite side of the church.

The Gawsworth "home" and estates appertaining thereto have figured prominently in our country's annals; and the old times have left in the hamlets around some of the prettiest "magpie" homesteads ever built.

At Brereton Green, near Sandbach, is a fine example of the "village inn" erected in the seventeenth century, of bricks, post and plaster. The carving about the doorway is very picturesque from an architectural point of view. Another "green"—that of Arley—is well worth noting. Its "magpie" school and school-house have provided models for many modern cottages, schools and club-houses. Arley Green is on the Warburton Estate where the pictorial and antique in architecture is preserved with every possible care. The ancient church of Warburton was built in three periods; the post and plaster being the first, as is evidenced by its massive pillars, struts, and tie-beams.

Handforth Hall, like Moreton, presents many features of line and curve which are of sound import to the draughtsman. Handforth is not all post and plaster, though much

increasingly important, as every type of rural dwelling-house modelled in black and white may, from these time-honoured examples, learn much to its advantage.

THE MANOR HOUSE, UPPER SWELL, GLOUCESTERSHIRE.

THIS charming house is situated about one mile from Stow-in-the-Wold, and in the heart of the Cotswolds. Built on a rising ground and adjoining the church, it attracts attention immediately by its picturesqueness and excellent architectural proportions, the two gables running into each end being very uncommon. The interior contains some very good Jacobean panelled partitions, and in the first floor room to the left of the sketch a very fine example of an open fireplace, with dog grate of the same period. This must originally have been the principal reception room, as it is the largest in the house. The staircase, a very large one in oak, has a succession of small flights and quarter landings, returning and running back for a distance of 18 feet, and the flights are 5 feet 6 inches wide. The whole of the staircase is heavily moulded with ball finials to the newels, and the

From a Drawing by Mr. J. BERNARD MENDHAM.

"THE ARCHITECT," STUDENTS' SKETCHING AND MEASURING CLUB.

balusters, $3\frac{1}{4}$ inches square, are exceedingly handsome. There is no definite date assigned to the house, but it is believed that it was built about 1615 A.D., and no doubt some historical

incidents are associated with it, but these are not available. Altogether the house is very interesting, and well worth a visit by architectural students.

The South Prospect of Harewood House near Leeds erected AD 1759 Johannes Carr Arch^t

From a Drawing by "L'QUAYT."

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

HAREWOOD HOUSE, YORKSHIRE.

HAREWOOD HOUSE, near Leeds, the seat of Lord Harewood, was built for Mr. Edwin Lascelles in 1759 by John Carr, architect, of York. In Sir William Chambers's book on "Civil Architecture" there is a note in reference to a design for a garden house at Marino that it "was originally made for one of the end pavilions of a considerable composition, which, among many others, Mr. Lascelles procured for Harewood House." A complete design for Harewood House by Adam exists in the Soane Museum, and Mr. Sydney D. Kitson, in his paper read before the Royal Institute of British Architects last January, is of the opinion that Carr was largely influenced by Adam's competition work, and that he merely modified it in detail. Sir Charles Barry made considerable alterations and additions last century and absolutely destroyed the original composition. He added an ill-proportioned attic storey to each wing, built a high balustraded parapet on the centre block, and removed the columned portico on the south front. This latter mutilation is particularly unfortunate, as the pilasters are now unequally spaced and destroy the rhythm of the composition. The removed capitals to the columns, parts of the entablature, and the carved tympanum are now lying in the estate building yard.

The house was decorated by the brothers Adam, the furniture was designed and made by Thomas Chippendale, and the gardens laid out by "Capability Brown." The building is erected of a very fine sandstone and, like all Carr's stone building, is a marvel of scientific masonry. The detail is refined and shows evidence of Adam's influence, but the composition and details are not so perfect as that shown in the entrance lodge and gateway built by Carr after the house was finished (illustrated in *The Architect* of November 4, 1910).

H.M. TRADE COMMISSIONERS for South Africa report, in connection with the development of the building trade in the Transvaal, that during the three months, July to September last, seven Transvaal municipalities approved plans of buildings to be erected at an estimated cost of 626,171*l.*, an increase of 233,383*l.* over the cost of the buildings authorised in the previous three months.

THE TAJ MAHAL, AGRA, AND ITS RELATIONS TO INDIAN ARCHITECTURE.*

THE Taj Mahal, situated in India on the left bank of the River Jumna, a short distance from Agra, is, on account of its beauty and costliness, one of the wonders of the world. It is the tomb of Argemond Banu, the favourite wife of Shah Jehan, who constructed it in the year 1631. He himself passed away in 1658, and his remains lie beside those of his queen.

The building stands on a platform 18 feet high and 313 feet square, with four minarets at the corners, each 133 feet high. The building, which is 186 feet square, with the corners cut off, occupies the centre of the platform.

The height of the façade in the centre is nearly 100 feet above the level of the platform, while the apex of the dome rises to nearly twice this height. The interior contains an octagonal chamber in the centre about 50 feet across, with passages leading to four smaller chambers at the angles. The whole of the interior and exterior consists of pure white marble inlaid with agate, blood-stone, jasper, black marble, and lapis lazuli in that form of Florentine mosaic known as "pietra dura."

This is all the technical description of the tomb that I propose to give you, because my object in this lecture is to show you wherein the secret of the great beauty of this monument lies, a beauty which is dependent not only on its immediate surroundings, but on the state of the weather, the time of day, and even the artistic discernment of the beholder, which may account in a great measure for the differences of opinion among visitors. Doubtless all buildings are affected in the way I have suggested, but when you understand the secret of the Taj you will understand why this building is pre-eminently so.

The only two points to which I would call your attention just now are, first, the difference in the outlines of the great dome and the subordinate domes, and, secondly, the fact that no work above the roof serves any useful purpose. Perhaps there is no building in the whole world which has received such extravagant praise from travellers, and no building in

* Abstract of a paper read before the Indian Section of the Royal Society of Arts by Robert F. Chisholm, F.R.I.B.A., F.S.A.

the world of which pictures, photographs, and models convey so poor an idea, the reason being that the high position to which most travellers raise it is due more to its unique, almost magical appearance, than to either its architectural merits or to an appreciation of its intrinsic value. In regard to its architectural merits, buildings can be found in India surpassing it in every direction, and for size and boldness of construction the Taj falls far below the Gol Gombaz at Beejapur. This building covers a square of 135 feet 5 inches; Santa Sophia, at Constantinople, covers an area of 103,200 feet; St. Peter's, at Rome, 227,069 feet; and St. Paul's, London, 84,025 feet.. In wealth of intricate detail and great delicacy of finish it is surpassed by the Jain temple at Dilwara, on Mount Abu, in Rajputana; in size, unity, and symmetrical arrangement by the great Jumna Musjid at Delhi; in constructive skill by the ingenious doming of the mosque of Sher Shah in the old Kila at Delhi; in magnitude and extent by the great Sivite Temple of Madura, South India, and in strict conformity to the canons of pure architectural decoration by the building known as Jehanghirs Mahal at Agra and the Bir Bul at Fatehpur Sikri.

Perhaps some of my hearers may have observed a curious illusion which occurs at sea if a boat is approaching from a distance; the men who man the boat look like pigmies, and if nothing intervenes to express distance, and you watch continuously, the men remain pigmies until the cheated sense revolts, and the pigmies suddenly enlarge to full-sized men; to me personally, the illusion remains until the boat is quite close to the ship. Now in some such way I seemed to realise suddenly that what I took to be a model was a building of noble proportions, but this knowledge seemed to increase rather than to diminish the effect of mystery; it was truly unlike anything I had ever seen—a translucent visionary object, part of the sun-bathed atmosphere, all-satisfying in its loveliness. For awhile I stood gazing in the simple enjoyment of the scene, then, as the sense of keen pleasure gave place to a sense of curiosity, I determined not to move forward one step until I had solved, at all events in part, the secret of this almost unnatural effect, and how it came about. First, I observed that all the shadows were in a very high key; the lights on the dark foliage of the cypress trees were deeper than the deepest shadows on the building; again, the windows, which seemed at that distance simple frames, opened into comparatively light, not dark chambers, while the entrance doorway looked like an ink-blot, seeming to mar the general harmony. I felt convinced at once that this was not intended, and looked for other inharmonious notes. These I soon found in the deep shadows of the subordinate cupolas on the roof. As my eyes became more critical, I detected the comparative coldness of the shadows above the roof as compared with those below; the shade of the great dome was grey, while the shadows of the recesses were of a warm amber colour. Everything above the parapet seemed cold and lifeless, while everything below sparkled in the brilliant sunshine, suggesting tones of crimson, citron, green, and orange. Approaching the building, I found it to be in the centre of a large platform of white marble which cannot be seen from the entrance, but the roof, which was doubtless also intended to be of white marble, was covered with that dulllest of all dull but useful materials, Portland cement—a deep-toned green-grey! The difference in the effect seems to justify the belief that the roof was intended to throw back on to the dome the maximum amount of reflected light, just as the marble platform on which the building stands throws back the maximum of reflected light on the lower part. The face of this platform, viewed from the gateway, appears to be part of the building, an intentional illusion I believe, which adds to the general ethereal effect by the weakening of the shadows due to the distance between the foliage and the building. Examining the windows more closely, I found that the comparatively light appearance was due to a regular pattern of white marble which acted as a white veil, and could not be perceived at a distance. As cost was no object, I cannot help thinking that if the effect produced was not intentional, the windows would have been filled by elaborate arabesqueing, like the screen at Delhi or the Ahmedabad Palm window. Tracery of this kind would have had a much richer effect, but, of course, it would not have toned the openings to that delicate warm grey. I found also the intensely black spot (the entrance which really opened into the building) to be without a blind or chick, though the two metal rings intended to hold it were in the lintel of the door. Mr. Havell, in his essay on the Taj and its designers, published in the *Nineteenth Century and After*, says that this opening was originally closed by silver doors.

If this is true, the door-hangings are probably in the frames still; the rings for the hanging of the chicks satisfied me, and I am sorry I did not look further. Again, the four corners of the building are cut off to a considerable extent to avoid the depth produced by simultaneous contrast. Lastly, the effect which would have been produced by mouldings and sunk surfaces in this particular style is here produced by black marble inlay, so that the general appearance is not unlike lace, and at the first glance gives the effect more of a drawing than of a real building. It is difficult to imagine that the attempt to secure the maximum of reflected light, the systematic heightening of all shadows on the façade and dome, the avoidance of strong contrasts, and the provision for planting heavy foliage around and before the building, were all the result of accident rather than the systematic working out of an artistic idea, and still more difficult to understand how, if that idea originated with the architect of the building, it was not carried out consistently to the finish, instead of being stopped at a point where, owing to the deep blue of the zenith, the strongest reflected light would be required. I do not intend by these remarks to disparage the architecture in any way. I am quite ready to admire the proportions, and to admit that the Taj would be a remarkable building under any light and constructed of any materials. What I desire to point out is that the startling ethereal appearance is not due to scholastic architecture, and could hardly have originated in an architecturally-trained intelligence, for such an intelligence is antagonistic to this principle of subordination, and delights in producing brilliant contrasts; it is rather an artistic thought, the idea of an artist, a man who loved light and could divide it into a hundred shades; a man who said to himself, "I have here practically an inexhaustible purse; the most lustrous material the world can produce, and the brilliance of a tropical sun. I will use my materials as I would paint a picture, subordinating all the deep shadows on the building, so that it will appear ponderous yet cloud-like, rising like a dream-palace out of a garden consisting of the deepest foliage procurable." The effect which the building produces on the observer leaves the artist's success beyond a doubt, for the man with the idea has portrayed materially the subtleties of pictorial values, which neither picture nor photograph can fix; in fact, he did for this style of art what Shakespeare did for the drama of his day, and the Taj will always be condemned or exalted in exact proportion to the perception of the idea.

In order to see clearly that this building was the natural outcome of the architecture of the period, we must glance at its history.

The Moghul empire, commencing with Bâber in 1526, lasted till about 1707, a little less than 200 years, and during this period a broad belt of the country from Lahore to Agra came under its immediate sphere of influence. It must be borne in mind that when the Mohammedans conquered India they found in all parts of the country a perfected art of architecture and groups of skilled workmen who were freely employed in all directions, and the Mohammedan ideas which filtered through these workmen gave rise to that mixed form of art named by Mr. Fergusson Hindoo-Saracenic, and if the zeal and energy the Hindoos threw into their work is any indication of the state of their feelings, it is interesting to note the goodwill that seemed to exist between the two races. But there was another influence at work. The commercial relations with all the countries west of the Indus increased during this period, and in proportion as they increased the Hindoo element died out of the architecture, and, at the time the Taj was built, although the actual workmen were Hindoos, the feeling and many of the forms were imported from the Bosphorus or Persia. We may conveniently divide the architecture of this period into three classes: first, the pure sandstone work; secondly, sandstone and marble mixed; and, thirdly, pure marble. In architecture the Hindoo disliked the arch as much as the Greek did; both seemed to have felt instinctively that an arch always embodies the self-destructive element; an arch is, as it were, always "awake" and never for one moment forgets to exert a thrust. In pure Hindoo art openings are bridged by corbelling, and it is to the strict adherence to this principle that we owe the great sense of repose which their architecture conveys.

Perhaps the most beautiful and intricate style of corbelling is to be found at Dehboi, in his Highness the Gaikwar's dominions. The same hatred of thrust and cross-strain exhibits itself in their domes, which are of low curvature on the exterior. First, the corners were corbelled out to form an octagonal figure, then stone beams were laid alternately,

CHLOSS KNESCHÜTZ.—Herr LEOPOLD BAUER, Architect.

[From *Moderne Bauformen*.]

square and diagonal until the space was small enough for a single stone.

It is hardly necessary to point out that this style has its limitations; its halls of a thousand columns simply meant that the space required necessitated a thousand points of support. But with the Mohammedans came the demand for greater clear space and greater height, and the consequent introduction of the arch and the true dome. The Hindoo builder never assimilated the arch; indeed, when used as a constructive feature, its lines were ignored and its decoration had no sympathy with the joints of the work. The arch would be constructed as an arch, but the lines of ornamentation accentuated panelling. It was not so, however, with the dome. From the first they seem to have grasped the fact that, unlike the arch, the self-destructive element is under control, that each ring of a dome properly tied exerted no outward thrust; hence, under Mohammedan influence, the dome-builders of India attained a mastery over this form unknown and seemingly unappreciated by the builders of the western world.

You will observe that if it is required to cover a square area by a dome, the section from corner to corner presents a very different aspect from that of the section parallel with the sides, as the corners are wholly unsupported. The methods adopted for supporting the superincumbent mass at the angles differ in different styles and different countries; perhaps the most beautiful and stable was that adopted generally by the Central India dome-builders. This method may be described as the intersection of two squares within the larger square in such a way as to leave a true octagon in the centre. This was further reduced by a figure of sixteen sides before passing to the round. An arch is then thrown from 1 to 2, 2 to 3, 3 to 4, and 4 to 1. Each of these arches are intersected in two points. The interior view is very beautiful. If an embroidered cloth is thrown over the "eye" the effect is much enhanced, and the echo destroyed. A dome constructed of stone can be cramped and doweled ring

by ring, but when constructed of brick the stability depends a good deal on the strength of the mortar. The great dome at Beejapur has cracked into lobes, and each lobe rests against its opposite neighbour in perfect equilibrium.

The dome of the Taj starts at once from the octagon, and is closed practically at the roof level, so that all above is merely for show. These domes seem to have been built without centres. Scaffolding and centring in India is formed of bamboos tied together with coir rope, and the form of the arch on the top is made up of brick laid in mud and brought to the correct form with clay. No centre of this description could stand continuous heavy rain, consequently the size of a dome, if supported during construction on a centre of this kind, would be limited by the amount of work which could be done during the dry months of one year. At Golkonda I noticed among the tombs that the last to be built had a very elongated appearance. Going inside to ascertain the cause, I found that it was not a true dome at all; the builders were evidently working on tradition, they had feebly turned in the top until their hearts failed them, then they had boldly trussed the upper part and left the truss in.

A cursory glance at the architectural development which extended over three-quarters of a century, shows that although the workmen always were, and indeed are now, mostly Hindoos, the style was gradually tempered by western ideas, and that at the time the Taj was built the Hindoo spirit had almost passed away. The general arrangement of a central dome with four smaller domes at the angles is similar to that found in Humaion's tomb in old Delhi.

I have endeavoured to show that the unique appearance of the Taj Mahal arises from a studied and systematic system of heightening the deep shadows and avoiding all those black patches which destroy a sense of distance. Its architectural lines were the natural outcome of the styles which preceded it, and the foreign influence is no stronger in this building than in other works constructed during this period. The

[From *Moderne Bauformen*.]

startling effect of the Taj is due to the studied control of light and shadow to produce what one might almost term a scenic effect in opposition to that produced by ordinary architectural practice, and I also think this effect largely dependent on the extent and quality of the foliage in the surrounding garden, and that the first glimpse of the building should always be from the entrance gateway with the sun or the moon in the zenith. That this effect is in the majority of cases unexpected and startling is beyond question.

Dr. Leitner, speaking of the Taj in this room not many years ago, compared it to a piece of lacework. "It appeared," said he, "with its dark background of foliage to float in the air, it was more like a dream than a reality." Bishop Heber said it was the conception of giants carried out by goldsmiths. The late Sir W. W. Hunter described it to me as "a stupendous jewel—not a building at all!" But perhaps the best description is that given by Sir Frederick Treves, one of the most recent travellers. "Every-one," he says, "who visits Argemond Banu's tomb for the first time approaches it with curiosity, tinged probably by a faint disposition to be hostile. So much has been written about this wonderful building, so much rhapsody has been lavished upon it, that there is some suspicion of over-praise. The claim that it is the most beautiful building in the world is a claim that many at once resent. Its outlines are familiar enough from pictures and models, and it may be that they hardly warrant unrestricted ecstasy. The visitor proposes to himself to put sentiment aside and review the building critically . . . to submit it to a common-sense inspection, for he is inclined to believe the Taj Mahal to be a much overrated monument. He has, indeed, already imagined himself on his return home giving to his friends evidence of his originality by asserting that as for the Taj he sees nothing in it. . . . With the first sight of the Taj Mahal there comes only a sense of indefinable pleasure, it is no mere feeling of admiration, still less of amazement. No mere delight in a splendid building, because it does not impress one as a building. There is a sudden vision, and

with it a sudden sense of ineffable satisfaction, as if in the place of a marble dome the garden had been filled with divine music. All intended criticism is forgotten; there is nothing that appeals to the judgment or that suggests the weighing of opinions. There is merely a something that touches the finest sense of what is tender, beautiful, and lovable—a white cloud, luminous, intangible, translucent! The secret of the beauty of the Taj Mahal lies in the great arched recesses or vaulted alcoves which burrow deep into the body of the building. These are throbbing with sensitive shadows, and they give the impression that the onlooker can see into the very heart of this gentle palace as one would gaze into the heart of a yellow rose, where leaf by leaf the tints become deeper, warmer, and more living. There is ever a sense of something half hidden and half revealed of a tenderness which has deeper depths! . . . It is this abiding suggestion which makes the peculiar glory of the Taj a glory which is beyond the reach of any picture or any model. To many the Taj will be the most beautiful building in the world, while there must be few who would not acknowledge that it is the most lovable monument that has ever been erected." If architecture compared with mere building is really the compensation which man offers to his fellows for robbing them of so much of God's fair work as each building blots out, the sins of the man who inspires such praise as this must surely be forgiven. Who the man was matters very little; indeed, for all that, it might have been a woman! But whoever it was, receives the gratitude of countless admirers.

ROYAL ACADEMY WINTER EXHIBITION.

THE outcry raised when the Royal Academy authorities offered, instead of the usual Winter Exhibition of Old Masters, the heterogeneous collection of pictures purchased by the late George M'Culloch, will not presumably be repeated on the present occasion. Nevertheless, many of the objections raised two years ago would not be inapplicable to the Winter Exhibition which was opened to the public on

Monday last. This year five of the galleries are occupied by the works of as many deceased members of the Academy. The cult of the Old Masters is in no danger of decay yet awhile; while the appreciation of modern art is. Presented in the way of a Winter Exhibition the works of these deceased artists are not shown in any unduly favourable light, for they court searching criticism and cold comparison. The five artists represented are Sir W. Q. Orchardson, Mr. W. P. Frith, Mr. R. W. Macbeth, Mr. J. M. Swan, and Mr. D. Farquharson. They represent an interesting phase in national art and are of historical value.

The first gallery is filled with pictures and one figure piece by Mr. John M. Swan, who is accepted as one of the leading spirits in our small school of animal painters. After studying at the Lambeth Art School (under John L. Sparkes) Mr. Swan went to Paris, where he was under Gérôme, Bastien-Lepage, and Dagnan-Bouveret for painting, and Fremiet for sculpture. His earliest contribution to the Royal Academy was sent in 1878—"Dante and the Leopard"—and is here shown on the walls. Some eighteen years later came "The Piping Fisher Boy." These can now be, and should be, compared, for they are a striking testimony of all-round improvement. The later work is a really charming contribution. As recent as the 1910 Exhibition was "The Cold North" shown, and so this remarkable picture must be fresh in the minds of our readers. It has been said that it shows more superficial handling than his "Polar Bears." This is open to doubt, for the poignancy of the icy desert seems more accentuated by the huge forms of the two motionless Polar bears stretched at full length upon an ice hummock, as compared with the three Polar bears vigorously swimming. Another familiar picture is his "Orpheus," the nude young god striding through the forest preceded by birds and butterflies and followed by a train of beasts. "Lioness Defending her Cubs" is a further popular work here shown. There are many other examples of this artist's known skill in depicting animal character, and most especially of the cat tribe. In the water-colour room is a valuable collection of drawings and bronzes by Mr. Swan.

The late Mr. W. P. Frith, C.V.O., exhibited for the first time at the Royal Academy in 1840, and from that time until 1902 he contributed works without a break, if one excepts a very occasional lapse of a year. He was elected an Associate in 1845, and in 1853 he was chosen to fill the vacancy caused by the death of Turner. His work seems of quite another period to that of Mr. Swan and the other artists who are here represented. His greatest chance of respect from posterity must date from his work subsequent to "Life at the Seaside"—better known, however, as "Ramsgate Sands." In his autobiography Mr. Frith wrote: "My summer holiday of 1851 was spent at Ramsgate. Weary of costume-painting, I had determined to try my hand on modern life, with all its drawback of unpicturesque dress. The variety of character on Ramsgate Sands attracted me." The picture is lent from Buckingham Palace. Seven years later it was followed by "The Derby Day," which would be a notable addition to Gallery II, if it could be included. In 1862 "The Railway Station" was contributed, and it makes one of the most notable and interesting examples of Mr. Frith's work here shown. Though Mr. Frith was such a profuse worker, the number of his pictures at Burlington House is under ten. They will not win for the artist a very high place, though as a figure in the development of English painting he plays an important part.

Sir W. Q. Orchardson is more strongly represented than any of the five artists, for there are over sixty canvases by him. They cover the period from his eighteenth year, when "George Wishart's Last Communion" was shown at the Royal Scottish Academy, to the portrait of "Mr. John Hutchison, R.S.A.," which was in the recent Summer Exhibition. The artist enjoyed a long popularity, though it may be said that he was exhibiting at the Royal Academy for close on twenty years before his "On Board the Bellerophon" attracted general admiration. That work, however, has not been borrowed from the Tate Gallery for the present exhibition. There are others shown which are quite, or certainly almost, as well known. Prominent among them is the finished sketch for "Voltaire," the original of which is accepted as the artist's high-water mark in technique. This sketch was finished in 1907, some fourteen years after the original was completed. A still more sumptuous scene was treated in "The Young Duke"; but it lacks the dramatic compulsion of the earlier work, and is not so arresting, large though it is. About this period appeared a number of works like "A Tender Chord" (reckoned one of his most exquisite productions), "The Salon of Madame Recamier," and "Her Mother's Voice," which firmly esta-

blished his reputation; of these only the first is here shown. The artist is put in the front rank of portrait painters, and his right to the position is abundantly proved by the many fine examples in Gallery III.

Another Scotsman who came to London and captured a leading place among contemporary artists was Mr. Robert W. Macbeth. He is not, however, seen to very great advantage in his present company. His work is chiefly represented by the water-colours and etchings in the Black and White Room. A strong decorative feeling frequently appears, as in his long panel of "A Lincolnshire Gang" and "Potato Harvest in the Fens," which are each about nine feet long by three feet high.

A third Scotsman to achieve a notable success south of the Tweed was Mr. David Farquharson, A.R.A. There are only five of his pictures now at Burlington House. But as they include his recent "Dartmoor" and "Full Moon and Spring Tide," which were both painted in 1904, the visitor cannot fail to be impressed by his capacity.

[The Editor will not be responsible for the opinions expressed by Correspondents.]

Petrol Air-Gas.

SIR,—As one who has made a close study of the properties of petroleum spirit, involving a great deal of research work, I have read with interest Professor Smith's articles on "Petrol Gas" in your recent issues. Now that the series is finished, perhaps you will allow me the hospitality of your columns to point out a small matter in which I entirely disagree with the author of the articles in question.

On page 234, under the heading "Dangers Attendant upon Certain Mixtures," he makes the following statement: "Air absolutely saturated with petrol vapour is not very explosive, though it may be made so by compression. Similarly, air containing just sufficient vapour to allow of combustion, which point practically coincides with that necessary for complete combustion without added air, is also non-explosive."

As he goes on further to state what happens upon an escape into the air, I take it that in the above statement he is referring to the properties of these mixtures without further dilution, as, for example, in a confined space such as the gas-holder of a petrol-gas plant. The question of compression scarcely comes into consideration, as the light pressures used in petrol gas practice can hardly be styled "compression."

Now, Sir, my experience, and I think the experience of anyone with a practical as distinct from an academic knowledge of the properties of petrol vapour is the very opposite to that stated by Prof. Smith—viz., that a saturated mixture, and, in fact, any mixture containing more than about 5 per cent. of petrol vapour, is not only non-explosive but incombustible without the addition of further air. On the other hand, a mixture containing the right amount of air for complete combustion is very explosive, and if a quantity of it is ignited in a closed container will blow that article to bits if it is constructed of the light material employed for small gas-holders.

As several manufacturers of petrol gas employ the self-burning and explosive mixture (1½ to 2 per cent. of vapour in the gas) and a few the richer, and, as I consider, far safer mixture, it seems to me a pity not to put the difference clearly before your readers.—Yours faithfully,

ROBERT W. A. BREWER, A.M.I.C.E. &c.

Thin Walls and Piano Playing.

SIR,—As a constant reader of your paper, may I ask a query through the columns of your journal, viz.: Could any readers inform me how to prevent the constant noise of piano-playing penetrating through into an adjoining house? For instance, there is a school adjoining a certain house in which they are playing four pianos the whole day. Consequently the house lies vacant, as I cannot get a tenant to stay. The house is four storeys high, and the noise is as bad at the top of the house as at the bottom.

Trusting some reader will enlighten me, as I have tried different remedies, and thanking yourself for the kind courtesy,—Yours truly,

THE PLANNING OF A TOWN.

IN the critique which we published last week of the drawings submitted in the town-planning competition for Ruislip Manor, Middlesex, our reviewer touched upon several points that seemed to have been forgotten both by competitors and assessors, and it may, therefore, be perhaps worth while to give some consideration to the matters that are of importance in the planning of a town.

When an architect sets himself to design a town plan, what is the first thing to which he should give attention? Is it not the position of the people who are to live in it? Is it to be such a town as Bournville or Port Sunlight, of which virtually all the inhabitants are employed by one firm, who, for the sake of the happiness, health, and consequent efficiency of their employes, practically make a grant from their establishment charges account towards the expense of housing their workers at lower rents than will pay a fair interest on the capital laid out?

The architect who has to plan such towns as these is in a very different position from him who has to contrive that his scheme shall return a satisfactory dividend on capital expended, as at Letchworth or Hampstead. These are not charitable institutions, but business propositions, in which philanthropy requires 5 per cent. for its benevolence. Letchworth is partly a manufacturing town, partly residential. Some of its inhabitants earn their living near their homes, others have to travel daily to and from their place of occupation. Hampstead, on the other hand, is purely residential, a suburb of the Metropolis, with the centre of which it is within cheap and easy access. Thus the conditions of the two are quite dissimilar.

Speculative builders make fortunes or become bankrupt exactly in accordance with the correctness or incorrectness with which they gauge the class of tenant for whom they build. If they are right in their forecast, their houses let as soon as they are erected; if they are wrong, the houses remain empty or unfinished till the claims of mortgagees and locked-up capital bring about disaster.

So it will be with the clients of an architect who plans a town which has to stand on a commercial basis. No amount of pretty pattern designing, civic centres, open spaces, closed vistas, or stately avenues will pay a dividend if the plots or the houses are too large or too small for the people who are prepared to become tenants. Instead, there will be vacant sites and empty houses, which will not only absorb unprofitable capital, but will damage the reputation of the town to an extent that will tremendously handicap any attempt at revision of the scheme.

An estate or town with a bad name will be long in attracting any tenants at all, even if a fresh start is made.

It is clear, therefore, that the very first step of a town planner is to determine the class of inhabitant and the character of the town, whether industrial or residential; if industrial, whether the workers are employed near their homes or have to travel considerable distances, as in the case of the London County Council estates, White Hart Lane, and the rest; if residential, whether the householders have to travel afield for their daily business or are to any considerable extent of independent means.

Upon what we have called the character of the town will depend many further important matters—the relative proportion of the areas of open spaces and building plots, the provision of places of amusement and social intercourse, clubs, institutes, libraries, &c.; for a town is not merely an assemblage of houses and gardens, open spaces and roads, but includes many other things, which will vary in accordance with the character of the town. Motor garages, for example, will not be required in very large numbers if the houses are all of 30l. a year rental or less, while public baths and wash-houses need scarcely be provided for the inhabitants of houses at 100l. a year rental.

In fact, the planning of a town must start from the same data as the planning of any other piece of architecture, the extent and the nature of the accommodation required. The number of shops to be provided demands careful study. What would be ample provision for Hampstead, from which a few minutes and a few pence will take the ladies to Tottenham Court Road or Charing Cross, would be utterly insufficient for Ruislip Manor or Letchworth.

Although in these days of week-ending churches and chapels are not so well attended as they were a quarter of a century ago, sufficient provision must be made for places of worship; while facilities for education must be ample whatever the character of the town, though the type of schools and their number will vary to some extent. As our reviewer pointed out, in some of the designs for Ruislip Manor the provision for these essentials was absurdly inadequate.

Having settled what buildings, houses, shops, factories, and communal institutions are to be included, the architect of a town should next consider the question of facilities for traffic and intercommunication, not only between the various parts of the town, but also between it and its environment. If the town is a residential suburb of some larger town or city, to which a considerable number of the inhabitants travel daily for their business occupation or for pleasure, the access to the railway

From a Drawing by "SANS PEUR."

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

This shows an old cottage on the Green, Ely, with the church of St. Mary in the background. The cottage is an interesting study of the use of half-timbering, although the bays shown are of modern date. The whole forms a very pleasing picture.

station must be made as direct and short as possible. Connection with the main roads of the surrounding district must also be easy and rapid in every case.

In the internal system of communications, the shopping centres and the communal institutions should be so located that, if possible, no inhabitant should have further to go to them from his home than three-quarters of a mile. The designer of a town is thus led to commence the consideration of his road plan, and is brought face to face with the choice between the Franco-American school and the German, the preference between the stately avenue and the closed vista. Not that it is necessary to rigidly adhere to either one or the other; a compromise or a combination between the two may very well be adopted by the British town planner.

The natural features of the site of the future town must at this point be taken into account, and the lay-out of the road plan must have reference to the contours as well as to the levels. High-lying land ought to be carefully conserved for residences, and preferably for homes of brain-workers, who nowadays are sufficiently aware that their efficiency is very largely influenced by the number of feet above the Ordnance datum at which they sleep. Low-lying, swampy land, if such unfortunately exists on the town site, ought, as far as possible, to be devoted to open spaces, a point that was recognised in many of the plans submitted in the Ruislip Manor competition.

Contours ought to be regarded as essentially determinant of the road plan, so that road gradients may be reasonable, and sewers may have a regular and, as far as possible, even inclination. Dips in roads, although a characteristic of many of our older turnpikes, based on the methods of the Roman occupation, are illogical, and entail

unnecessary expense in sewerage that might be avoided by proper planning.

Aspect must also be deemed of vital importance in laying out the road plan. Other things being equal, that town will be the healthiest in which the greatest number of the houses face east and west rather than north and south.

When all these practical matters have been given their due prominence, then the architect of a town may begin to think how he can incorporate them in an artistic and beautiful setting, how to arrange his civic centres and other points of interest, his vistas and scenic effects. Last of all, he should concern himself with the devising of a pretty pattern on the map. In the vast majority of cases symmetry of plan will be utterly wrong, for only on the rarest occasions will the best alignment of roads on one side of an axis be duplicated by the best alignment on the other.

NOTES AND COMMENTS.

It is to be hoped that our British competition promoters will not borrow the smart idea of the Greek Ministry of the Interior in their international competition for a Court of Justice at Athens. Each competitor has to contribute a sum of two hundred drachmæ, or eight pounds sterling, towards the honorarium of the jury. Of course this sum is no great addition to the cost of the drawings for a building to cost 160,000*l.*, but British architects do not want any further impositions just when they have succeeded in inducing the Royal Institute to advocate, in the new regulations, the reduction to some extent of the fearful waste of time and money that is the inevitable accompaniment of the system of open competition and its worst feature.

A CONFERENCE is to be held at the Alpine Club tomorrow, Saturday afternoon, at 3.30 p.m., under the auspices of the National Housing and Town Planning Council, to consider the subject of "Town Planning in Practice." This will have especial reference to the Ruislip-Northwood Council's town planning scheme, and will afford participants in the Ruislip Manor competition a grand opportunity for discussion of the principles that they think ought to be observed in planning a town.

THE report of the proceedings of the Council of the Hartley University College, Southampton, at which was discussed the proposal to institute a competition among architects for the new buildings which it is anticipated will ultimately cost some 100,000*l.*, is very satisfactory, and shows that there is among the English public a desire to do the right thing if only this is pointed out to them. By the advice of a Southampton architect, Mr. GUTTERIDGE, the Council retracted from their first *faux pas*, took counsel with the President of the Royal Institute, and followed his advice and that of Mr. HARE, whom he recommended as assessor. The Hartley Council is in rather an awkward position, as, whilst they wish to have a building that will cost 100,000*l.*, they have only got between 12,000*l.* and 13,000*l.* subscribed. We gather from the report of the interview that their Acting President, Mr. C. G. MONTEFIORE, had with Mr. HARE that, although the competition is to be for a 100,000*l.* building, the winner is not likely to have the chance at present of carrying out more than 35,000*l.* worth of work, and may very possibly have to cut this down to 20,000*l.* The assessor's fee is based on 100,000*l.*

WE are glad to learn that it is officially stated that the Vatican museums and galleries will not be closed during the great Art Exhibition which is to take place at Rome this year, despite the rumour that has been in circulation.

BIRMINGHAM is proceeding steadily with its town-planning schemes, and that for Quinton, Harborne, Edgbaston, and Northfield has reached the stage of Local Government Board inquiry under the Housing, Town-planning, &c., Act, 1909. At the inquiry there was very little opposition to the general lines of the scheme, and that little was not of a serious character, as stated by the Town Clerk in his reply. In the Corporation's scheme for East Birmingham the notices have been served and the required time has elapsed between such service and the application to the Local Government Board for permission to prepare a town-planning scheme. In connection with this scheme the Corporation has the opportunity of purchasing a farm of about eighty-two acres for 11,000*l.*, and the General Purposes Committee proposes to do this with the sanction of the Council and the Local Government Board.

LIKE all Acts of Parliament, the Housing and Town-planning, &c., Act, 1909, seems to require legal interpretation before its meaning can be understood by those who have to act under it, and the Special Committee of the Glasgow Corporation has failed in its attempt to carry out a closing order on the ground partly of technical irregularities, but chiefly because it proposed to treat a tenement containing forty-one homes as a "dwelling-house," and failed to properly specify the grounds upon which it was granted, a distinction not being made between "dangerous" and "injurious to health."

MR. WALTER W. THOMAS, M.S.A., makes a suggestion in the *Liverpool Courier* that the Liverpool King Edward memorial statue should be placed below the steps on the Lime Street front of St. George's Hall. This is less objectionable than the original much-condemned proposal, but can hardly be considered ideal. The crux of the whole matter is that the statue as designed and the Hall are utterly incongruous.

MR. SPOONER, in his lecture on "Modern Churches" before the Birmingham Architectural Association, uttered some valuable truths. He said that for practical purposes Christians might be split into two great divisions—Catholic and Protestant. The former made the Holy Communion very markedly the central act of worship, accompanied with more or less ceremonial. The other looked upon it more as a memorial, and gave great prominence to preaching. This fact had its effect on the building of the churches, because the ideas of the plan and arrangements of the buildings were different. The design of the old mediæval church was suitable to the Catholic form of worship, because it remained practically the same in essentials as it was at the birth of the Church. On the other hand, there was a great difference between the idea of our forefathers in the Middle Ages and the generally expressed idea of to-day. To-day the first thing thought of was to provide for the congregation, whereas the people of the past thought first of providing for the worship of Almighty God. They thought—and he was of opinion theirs was the truer intention—that the church should be the best and most beautiful building in the place, beautifully furnished and decorated with the best they could use. But, generally speaking; those who had to build churches had to do the best they could with the limited means at their disposal, and the difficulty of producing a beautiful building worthy of its high purpose was greatly increased thereby. It behoved them all to see to it that their standards were true. First of all they must keep in mind that the church was a monumental building—one that stood for a great, perhaps the greatest, idea—whether it were large or small. They must build solidly and substantially. The work should be economically, but certainly not meanly, done, and in such a way as to ensure a minimum of repair. Largeness and simplicity, together with good building, told much more than ornament, delightful as ornament was when it was good. It was necessary to be guided by the type of service which happened to be the custom in the particular parish—he meant whether the service was rich in ceremony or comparatively plain. The building should be so designed that it would be suitable for full ceremonial, because a church was built not for this generation only, but for other generations, and it would then be suitable for the plain service as well as for the other.

THE contrast between Cathays Park and some of the homes of the people of Cardiff is saddening in the extreme, and we are glad to know that the Cardiff Health Committee have awakened to a sense of their duty in regard to certain areas in Cardiff which are badly lighted and cleansed, and where the housing conditions are far from satisfactory. It is pitiful to read of some of the things that the Committee saw in their visits and of the pathetic clinging of the poor residents to the miserable hovels that they called home. The Committee rightly decided to make closing orders, on the ground of "not fit for habitation," in regard to premises in Nora Street, Little Frederick Street, Williams Court, Hills Street, and to request the medical officer of health (Dr. Walford) and the city engineer (Mr. Harpur) to prepare a scheme in regard to certain areas off John Street areas. The Committee further decided that every member should be supplied with a copy of "Thompson's Handbook to the Housing and Town-planning Act, 1909," published by the National Housing and Town-planning Council. If Mr. BURNS could point to no other results of the Housing and Town-planning, &c., Act, 1909, than the suppression of these ancient slums in Cardiff he would be fully justified in his efforts with that measure.

EDINBURGH is getting on very slowly with its purpose of a King Edward Memorial. Plenty of people have made suggestions, and an invitation has been sent to their authors to submit details of their proposals. The Committee who have the matter in hand, in order to be in a position to recommend, require to examine the various schemes in some approach to concrete shape, with

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

Market Place, Hexham.—This sketch is taken from underneath the old Moot Hall, and shows the old Market House of Georgian design, with elegant Doric columns, while beyond is seen the north transept of the Early English Abbey, recently restored by Mr. Temple-Moore.

financial and practical particulars. Unfortunately, in no case have such necessary details been forthcoming. Up to the present there has been no response to the invitation. The proposals put forward are still in their original state of nebulosity. This is exactly what is always happening. Those who would be thought "experts" write to the *Times* and other newspapers and make suggestions for all sorts of wonderful schemes for remodelling London or some other city, but never vouchsafe any indication of the cost or of the possibility of finance, beyond general and unreliable statements of the vaguest description.

THE two-page drawing by Mr. HAROLD OAKLEY, the well-known architectural perspective draughtsman, which appeared in the *Illustrated London News* of December 31 adopts a method of delineating the interior of a building—in this case Drury Lane Theatre—that is far more easily comprehended by the Philistine than plans and sections, and is quite a favourite on the Continent, where possibly its prevalence has something to do with the more intelligent appreciation of architecture by the public than is unhappily the case among ourselves.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

WE have received only two sets of measured drawings for the December subject, a pulpit, although we gave a wide range of date from 1200 to 1800 A.D. Both of the examples selected are of late date.

"L'Quayt" has measured and drawn a good

eighteenth-century pulpit in Bolton Percy Church, Yorkshire, and "Sans Peur" a good example of seventeenth-century date in St. John's Church, Newcastle-on-Tyne.

Both the contributors have done their work well, and we shall divide the prize for December equally between them.

"THE ARCHITECT" TRAVELLING STUDENTSHIP TOUR, 1910.

By CHARLES HENRY WALSH.

ALMOST every architectural student at some time in his career makes a journey to the wonderful Gothic buildings of East Anglia, and those who have experienced it can well imagine the tension of a student hurrying across country to see those great buildings of which he hears so much and as yet has not had the opportunity to behold. Such were my feelings as I left Yorkshire to see some of the arts and methods of our mediæval builders in East Anglia.

After arriving on a bright August Saturday at King's Lynn, I made my way through the narrow streets to discover some of the objects of interest in the old town. St. Margaret's Church, perhaps, occupies the premier position with regard to size and importance. It is a magnificent structure. The great length of the nave and choir add much to the dignity of the interior. An interesting feature is the passage in the clerestory wall, which at one time ran round the whole church, and is still to be traced at the east and west ends. The church

has evidently been altered and restored at various periods; consequently there is a strange admixture of feeling in the detail of the various parts.

Sunday afternoon tempted a walk to Castle Rising, a great Norman stronghold, which affords a fine conception of how those lawless barons feared neither king nor law. The great earthworks and moat still surround the castle, which contains many objects of architectural interest. Castle Rising church is well worth visiting—a rather small building, but having a very rich Norman west front and an interesting Norman font. Another object of interest is the old market cross, standing close to the church, and in a remarkably good state of preservation.

On Monday I went to the village of Terrington, about six miles to the west of Lynn, to all appearance a simple agricultural centre, and yet possessing a fine Perpendicular church. In plan it takes the form of a Latin cross, with rather short but lofty transepts, and a lantern tower over the crossing. Some remains of a thirteenth-century building are still visible at the east end—e.g. the beautiful sedilia and piscina illustrated, a window on the north side of the chancel, and the doorway into the vestry. This sedilia was discovered some thirty years ago and carefully restored under the direction of the late Sir ARTHUR BLOMFIELD. The Perpendicular font is also interesting, with its peculiar painted cover, although the colour seems to blind one to the elegance of its form.

On Tuesday I continued my tour of Lynn. St. Nicholas, a chapel of ease to the parish church, is a very handsome building. The plan consists of a nave and aisles running the whole length of the church, and a south-west tower and south porch. The main building dates from the fifteenth century, but some traces of a thirteenth-century building are to be found in the lower portion of the tower. The original spire was blown down in 1741.

Other work of note in the town are the Custom House, a charming little piece of Renaissance; the Chapel of the Red Mount, supposed to have been designed by the architect of King's College Chapel, Cambridge, on account of some similarity in the vaulting; and the Grey Friars Tower and Town Hall. Almost all the streets in Lynn have some architectural interest, but they are too numerous to see or describe in so short a visit.

Wednesday took me to Wisbech, a town of little interest, but a good centre for its interesting surroundings. St. Peter's Church is most peculiar, containing two naves and chancels, as it were, and two aisles. The earliest work is Norman, seen in the north arcade. The southern arcade and the arches dividing the chancels are of the fourteenth century, and a Perpendicular arcade divides the naves. The fourteenth-century font is rather interesting, and also the bell tower, standing alongside the north-west corner, but difficult to appreciate on account of its confined situation.

On Thursday morning I walked to West Walton, a distance of about four miles from Wisbech. The detached church tower can be seen from the road for a distance of a mile, and a very fine sight it is. No student could resist sketching it. Of course the detail of this church is too well known to need description, but one cannot help dwelling upon the delicate and exquisitely carved capitals of the arcades, and also the fine composition of every part of the thirteenth-century work. What great artists those men must have been! It is a matter of regret that this beautiful building should be kept in such an untidy state, especially as it is a place of worship. Could not something be done to petition the removal of such unsightliness? I think an effort is due from architects, who derive so much benefit from this glorious work.

Friday again took me to West Walton to complete my drawings, although weather conditions were not very favourable.

Saturday brought more rain; still I went to Leverington—a distance of about three miles from Wisbech—to make a sketch of the south porch, perhaps the most in-

teresting feature of the church. The earliest work, which is thirteenth century, seems to be in the lower portion of the tower and in the chancel, with alterations made in the fourteenth and fifteenth centuries. The nave and aisles appear to have been rebuilt in the fifteenth century. There is some good fifteenth-century glass in the south window of the chancel, and an old oak lectern in the shape of a raven.

Saturday evening I went to Peterborough.

On Monday morning I commenced a study of that great Norman cathedral. It is known too well to need any comment; but I might add that a very fine view of the west front may be obtained from the Palace garden, thanks to the kindness of Mrs. GLYNN, who pointed it out to me and allowed me to see it.

On Tuesday I took train to Thorney Abbey Station, and walked to Crowland, some six miles away, a dreary walk over flat, uninteresting country, but well worth the trouble. What a fine building this abbey must have been, although the ruins convey little idea of its original size, as only the north aisle and north-west tower remain, with some portion of the west front and nave. The plan of the abbey originally took the form of a Latin cross, with aisled transepts, apsidal east end, with ambulatory running round the choir, nave, north and south aisles, central and north-west towers. The north aisle has always been used as the parochial church of Crowland, and seems to have been originally constructed for a separate purpose from the rest of the Abbey.

I completed my sketch at Peterborough on Wednesday morning, and in the afternoon took train to Ely. Here again one has a subject which is very well known; but it becomes more interesting, perhaps, by comparison with the cathedral at Peterborough—e.g. take the central towers of each and compare the dignity of Peterborough with the grace and ingenuity of Ely. Both of the same period, one cannot help again noting the high æsthetic quality of the thirteenth-century work in the choir. How cleverly those builders introduced the lines of ornament into arch mouldings and jambs of openings to break the monotony of line, and, again, the skilful manner in which they arranged the conventional leaf ornament in the mouldings of the Galilee porch. It seems to strike a dominant note in all their work—that of a little ornament in the right place, and not too much of it.

THE NOTTINGHAM ARCHITECTURAL SOCIETY.

A MEETING was held at 64 St. James Street, on January 3, when the President, Mr. Robert Evans, jun., F.R.I.B.A., presided over a large attendance of members and visitors.

The subject of the paper was "Notes on the Town Planning Act, 1909, from an Architect's Point of View," by Mr. E. R. Sutton, F.R.I.B.A., the Vice-President, who had obtained the loan of several town planning schemes.

Invitations had been sent to the Nottingham City Council and the surveyors to the local district councils, and a number of these gentlemen showed their interest by being present.

Mr. Sutton said:—As I fear my paper on the Town Planning Act will be somewhat "dry," I will start with a few observations on the plans exhibited on the walls.

The first plan is the Hampstead Garden Suburb. This estate was laid out by a special Act of Parliament, freed from hampering by-laws. Roads 20 feet wide are permitted if they do not exceed 500 feet in length, and the houses are not less than 50 feet apart. Another interesting feature is, that the committee handed over to the public 80 acres out of the 320 for an extension of Hampstead Heath.

The original cost of the land was about 500*l.* per acre. Not more than twelve houses are erected on each acre. The Trust commissioned the well-known architect, Mr. Lutyens, to design the whole of the buildings in and around the central square. The purchase of the estate was completed on May 1, 1907, and there are now about 750 houses erected.

The second scheme exhibited is the Harborne Tenants, Ltd. In this, the parks, open spaces, play grounds and allotments have been as far as possible located on back land. The circular green towards the west end of the estate is an instructive example of the economy to be effected in town

planning. If the by-laws had allowed a narrow roadway around this green in the manner originally planned the cost would have been considerably reduced. The average number of houses per acre on this estate is just under ten. About ten acres of land out of the fifty-three have been reserved as open spaces.

The third example, Bournville, is four miles from Birmingham. In 1895 Mr. George Cadbury, the senior member of the firm of Cadbury Brothers, commenced the work of building a model village near the factories of the firm. In 1900 the estate was handed over to a trust on behalf of the nation, the whole income of which is to be devoted to solving the housing problem. The village now extends to 458 acres. Over 100 acres have been laid out for building, and the total number of houses is nearly 600. The death rate at Bournville is remarkably low. In 1904 it was 6.9 per 1,000, as compared with 19 per 1,000 in Birmingham. The death rate for Nottingham last year was 14.2. This is our lowest death rate on record, but I hope when our town-planning scheme is fully developed, we shall be able to compete with Bournville's 7 per 1,000.

The last scheme I desire to call your attention to is Letchworth, about thirty-five miles from London, known as the First Garden City. This is the practical outcome of Ebenezer Howard's book "Garden Cities of To-morrow." In this book the author suggests dealing with the evil of overcrowding in towns by building new centres of industry. The estate was purchased in 1903, consisting of about 3,818 acres, of which about 1,300 acres are to be covered by the town proper, while the remainder will be kept as an agricultural belt around. The factories and gas works are placed to the east of the estate, near the railway sidings. As the wind blows chiefly from the west this arrangement helps to keep away their smoke and noise. The municipal and other important buildings will be in the central square. From the architect's point of view, what is most lacking at present is dignity. The number of small houses each on its own plot, with varying roof-lines, cannot be expected to produce the restful effect which will be possible when the central area is developed. There is, however, one great redeeming feature with regard to Letchworth. The authorities commissioned one of our members, Mr. Heazell, to design and carry out one of, if not the most, important building on the estate, namely the church. It is hardly necessary for me to say this is a most dignified and beautiful piece of work.

I have, in conjunction with my friend Mr. A. E. Heazell, put together a few notes on the Town Planning Act. It was originally our intention to give a short account of our impression of the Conference held in London last October. With this object in view I kept a most elaborate diary, which, if any member is sufficiently interested, I shall be pleased to produce.

The author of the "Town Planning Act" is, of course, the President of the Local Government Board, Mr. John Burns, and on his own confession it was produced mainly by eating his breakfast at Mowlem's Wharf, at dinner time going to the cloister precincts of Westminster Abbey, and by playing in Battersea Park thirty-five years ago.

The "Housing and Town Planning Act," as you are doubtless aware, is an Act to amend the law relating to the housing of the working classes, and also to provide for the making of town-planning schemes.

The "Housing of the Working Classes Act" was passed in 1890, and the Act we are discussing, commonly known as the "Housing and Town Planning Act," in 1909. The Bill was submitted to Parliament in 1908, and on the second reading it was referred to a grand committee, which consisted largely of experts, and was the subject of close examination for 23 days. In 1909 the Bill received the Royal Assent and became law. The Act is divided into four parts. Part I., the Housing of the Working Classes; Part II., Town Planning; Part III., Medical officers, appointments, &c.; Part IV., Supplemental. I propose to limit my observations to Parts I. and II.

In Part I. there are fifty-three sections, a number of which are complicated, owing to the fact that they are what is known as "legislation by reference to other Acts." There are, however, some provisions in this part of the Act which may be useful to the architect. The first seven sections deal with acquisition of land, loans to local authorities, payments, &c.

By Section 4 the "Public Works Loan Commissioners" are authorised to lend to a "public utility society" up to two-thirds of the value of the property in place of one moiety as previously. A "public utility society" is defined as a society registered under the "Industrial and Provident

Societies Act, 1893." The rules prohibit the payment of any interest at a rate exceeding 5 per cent.

Section 6 provides for the local authority contributing towards the cost of laying out and constructing any street or road, on the condition that those streets or roads are dedicated to the public.

Section 8 provides for the local authority accepting a donation of land or money, or other property, for any of the purposes of the Housing Acts, and it is not necessary to enrol any assurance under the "Mortmain and Charitable Uses Act, 1888." Sections 10 to 13 relate to "Powers of enforcing execution of Housing Act."

Sections 14, 15, and 16 refer to "Contracts by Landlord," and are perhaps of sufficient interest to examine in detail.

Section 14 provides that "In any contract for letting a house, the rent of which does not exceed in London 40*l.*, in a borough or urban district (having a population of 50,000 or upwards) 26*l.*, houses situate elsewhere 16*l.*, there shall be implied a condition that the house is at the commencement of the holding reasonably fit for human habitation." Under the 1890 Act the limit was London 20*l.*, Liverpool 13*l.*, Manchester and Birmingham 10*l.*, elsewhere 8*l.*

In England the general rule of law is that except in the case of furnished houses, there is no implied contract on the letting of a house that it is "reasonably fit for habitation."

Section 15 provides that the landlord shall keep his property in all respects reasonably fit for habitation. The landlord or local authority may, on giving twenty-four hours notice in writing to the tenant, enter any house to which this section applies for the purpose of viewing the state and condition thereof. If it appears to the local authority that the undertaking implied is not complied with, they shall (if a closing order is not made) require the landlord (within not less than twenty-one days) to execute such work as the authority shall specify necessary. The landlord may within twenty-one days after receipt of notice declare his intention of closing the house. Thereupon a closing order shall be deemed to have become operative. The local authority have power to do the repairs, &c., and recover the expenses from the landlord. The landlord has right of appeal to the Local Government Board as to the executing of the work, and against recovery of expenses.

Sections 17 to 21 refer to "Closing and Demolition Orders."

Section 17 is an important one from the surveyor's point of view. Under this clause it is the duty of every local authority to make from time to time an inspection with a view to ascertain whether any dwelling houses in their district are in a state dangerous or injurious to health. If any house is found in such a state an order prohibiting its use for habitation shall be made, until it is rendered fit. Notice shall be forthwith served on the owner. Any owner aggrieved by the order may appeal to the Local Government Board, by giving notice within fourteen days. When a closing order has become operative the local authority shall serve notice of the order on every occupying tenant of the house in respect of which the order is made and (within a period not less than fourteen days) he and his family shall cease to inhabit the dwelling house. In default he shall be liable on summary conviction to be ordered to quit the house within such time specified in the order.

The local authority may make to the tenant an allowance on account of his expenses in removing as may be determined by the local authority with the consent of the owner. If the owner fails to consent to the sum determined, the allowance shall be recoverable by the local authority from the owner.

If the local authority are satisfied that the house has been rendered fit for human habitation they may determine the order. If on the application of the owner the local authority refuse to determine a closing order, the owner may appeal to the Local Government Board by giving notice within fourteen days after the application is refused.

In Sub-section 7, "A room habitually used as a sleeping place, the floor of which is more than 3 feet below the street level, shall for the purposes of this section be considered so dangerous or injurious to health as to be unfit for human habitation if the room is not on an average 7 feet high." If, however, a closing order is made in respect of such room, it shall not prevent the room being used for purposes other than those of a sleeping place. A demolition order does not apply to this sub-section.

Section 18.—When a closing order has remained operative for three months the local authority shall take into

consideration the question of demolition, and shall give the owner notice of the time and place at which the question will be considered. The owner is entitled to be heard. After being heard the owner will be told that if he is aggrieved he can appeal to the Local Government Board.

If the local authority is of opinion that the dwelling house has not been rendered fit for habitation, and steps have not been taken to render it fit, and that the continuance of any building being (or being part of) the dwelling house is dangerous or injurious to the health of the public, or the inhabitants of the neighbouring dwelling houses, they shall order the demolition of the building.

If the owner undertakes to execute forthwith the works necessary, the local authority may postpone the operation of the order for such time sufficient for the work, but in no case to exceed six months.

The owner may appeal to the Local Government Board by giving notice to the Board within twenty-one days after the order is served on him.

Sections 19, 20, and 21 are more for the solicitor than the architect.

Sections 22 to 29 deal with improvement and reconstruction schemes. The sections which concern us most as architects are 22, 26, and 27.

Section 22 deals with "unhealthy areas." The amending words "that the most satisfactory method of dealing with the evils connected with such houses, courts, or alleys, and the sanitary defects in such area is an improvement scheme" are substituted for "that the evils connected with such houses, courts, or alleys, and the sanitary defects in such area cannot be effectually remedied otherwise than by means of an improvement scheme."

I don't know if I have made the point clear. The sanitary defects might be effectually remedied otherwise than by means of an improvement scheme, yet if an improvement scheme was a more satisfactory method of dealing with the evils an improvement scheme may be carried out.

Section 26 provides for the inspection of "unhealthy areas." Under Section 5 of the principal Act, any twelve ratepayers may complain to the medical officer of health of the unhealthiness of an area. Thereupon it is his duty to inspect. Should the twelve ratepayers be dissatisfied with the report, they may now appeal to the Local Government Board, and on security for costs being given, a qualified medical practitioner must be appointed to report. Apparently the Local Government Board could not before this appoint one of their own officials to make the inspection and report.

Section 27 is an amendment as to right of easements. The principal Act provided "that all rights of way and easements shall be extinguished upon purchase of land for a reconstruction scheme."

Now if the person entitled to any right of way or easement consent, the right need not be extinguished.

Sections 30 to 35 refer to amendments respecting financial matters, which I do not propose to touch upon.

Section 43 is interesting. It reads:—"It shall not be lawful to erect any back-to-back houses intended to be used as dwellings for the working classes," but provides for certain exceptions as in the case of houses containing several tenements where the medical officer of health certifies that effective ventilation is secured.

Part II. of the Act is of a permissive nature. The general provisions are intended to promote co-operation between local authorities and land owners, and to remove difficulties in the shape of conflicting by-laws which prevent local authorities from acting jointly in a comprehensive scheme.

I propose to examine in detail the several sections which are important from the architect's point of view.

Section 54 provides for the inclusion in a town-planning scheme of any neighbouring lands. Before, however, any of the local authorities are justified in preparing a scheme with reference to any land within the neighbourhood of their area, they must satisfy the Local Government Board that there is a *prima facie* case for making such a scheme. Any local authority may be authorised by the Local Government Board to adopt with or without modification any such scheme proposed by all or any of the owners of the land comprised therein.

The scheme may include any land likely to be used for building purposes, for providing open spaces, roads, streets, parks, pleasure or recreation grounds, or for the purpose of executing any work incidental thereto. It may also include land already built upon, or that is not likely to be used for building purposes, if it appears to the Local Government Board that such land should be included, and provision may be made for demolishing or altering any building

thereon, so far as may be necessary for carrying the scheme into effect.

What land may or may not be included rests in the first instance upon the decision of the Local Government Board, but if an objection be presented, a public inquiry must be held in the locality before the matter can be settled.

A proposed scheme may be varied, or a subsequent one may be substituted, if the Local Government Board should think fit, or the scheme may be revoked entirely. In any case it does not become operative until it has been formally approved by the Board. If objection is made to it it does not become valid until it has been confirmed by Parliament.

Section 55.—In any scheme containing provisions for suspending any statutory enactment, by-laws or regulations, say in order to relieve the promoters of unnecessary expenditure on road construction or other works, such scheme does not come into force until a draft has been submitted by the Board for the approval of Parliament. When the land proposed to be acquired is situate in London, or borough or urban district, the Board must appoint an impartial person, not in the employment of any Government Department, to hold a public inquiry and report whether the land proposed to be acquired is suitable, and without detriment to the person interested, or the owners of adjoining land. If after receiving the report the Board confirm the Order, otherwise than subject to the recommendations contained in the report, their order is rendered a Provisional Order, and does not have effect unless confirmed by Parliament.

Section 56.—The Local Government Board may make regulations as to the mode of procedure to be adopted with respect to applications for authority to prepare or adopt a town-planning scheme. These regulations were published on May 3, 1910, and the following is a short summary:—

First of all the local authority must give two months' notice to all owners and occupiers of land likely to be affected and advertise their intention to apply for permission to prepare a scheme. They must deposit for inspection a map on the 25-inch Ordnance scale of the land proposed to be included and arrange to give any necessary explanation.

The local authority before making an application for permission to prepare a scheme shall consider any objection made to them in writing by the owners or other persons interested in the land included. The local authority shall arrange for at least one conference with owners or other persons interested. They are further required to arrange for at least one meeting. Notice (not less than fourteen days) of such meeting is to be served on all owners.

A copy of all objections must be forwarded by the local authority to the Local Government Board as part of the information required, when permission to prepare a scheme is applied for. If the Local Government Board give authority for the scheme to be prepared, notice must be served again on the owners of land included. When the local authority have fully decided on the scheme a draft has to be printed, further maps and particulars prepared and deposited for inspection for twenty-one days. The local authority must again serve notice on the owners and a public meeting must be held, as prescribed for the first stage of the proceedings. If the Local Government Board approve the scheme notice must be published in the local newspaper, and must also be given to the several owners. Any interested person objecting to it must make his objection in writing to the Local Government Board, not the local authority this time.

Section 58 provides "that any person whose property is injuriously affected by the operation of a town-planning scheme is to be compensated, if he make a claim within the time limited (which must not be less than three months after notice of approval of the scheme is published), but where the scheme increases the value of other property the owner is liable to pay to the authority one-half the amount of such increased value. Any question as to whether the property is injuriously affected or increased in value and as to the amount to be paid as compensation either to the landowner or from the landowner to the authority responsible, is to be determined by a single arbitrator appointed by the Local Government Board, unless the parties agree on some other method of determination."

Section 59 provides for the insertion in any town-planning scheme of the height and character of, as well as the space about buildings to be erected, and the number of such buildings.

Section 60 provides for the purchase of any land in the scheme by agreement or compulsorily. The basis of value is left an entirely open matter, and no allowance is to be made on account of the purchase being compulsory. This appears to clash with the rights of ownership as generally understood. It seems rather a one-sided arrangement to com-

pel an owner to sell his land without making him some allowance beyond the ordinary selling value to an outsider, and to accept a price that is fixed by an arbitrator of the Local Government Board.

This finishes my notes on the Act itself, but I would here remind you that in Nottingham a start in "Housing Reform" has already been made, and Dr. Milner, the chairman of the Nottingham housing committee, in a recent address, pointed out "that there were three main principles in this reform:—(1) Ending or mending existing insanitary property; (2) prevention of similar evils; and (3) maintenance of improvements effected."

"The housing committee proceeded under the second part of the Act, which enabled them to improve individual houses at the expense of the owner, not the ratepayer. After the first year's work 347 houses were dealt with at a cost of 226l. 14s. 6d. to the Corporation, including administration expenses. At present the committee had a large number of houses scheduled, and the work was increasing to a very large extent. The great desire of the committee was to work amicably with the owners of property, and so far there had been no difficulty in the matter. Nevertheless they were determined to enforce their demands."

With a view of realising how necessary it is to have an Act like the Town Planning Act so that the land may be laid out to the best advantage, I have obtained the following particulars:—The population of England and Wales between 1891 and 1901 increased at the rate of 12.2 per cent., and in 1901 was 32½ millions.

Between 1891 and 1901 as much as 576,000 acres of land was transferred from rural to urban districts, and the quantity of land withdrawn from cultivation during that period was nearly 484,000 acres, which latter area increased between 1891 and 1907 to 624,000. These figures indicate that the quantity of land withdrawn from cultivation between 1891 and 1907 was nearly 42,000 acres per annum, or nearly 4 times the area of the city of Nottingham.

The population of England and Wales is increasing at the rate of nearly 400,000 a year, and the average annual area of land withdrawn from cultivation would thus be rather over 100 acres per 1,000 of increased population.

The following figures show how greatly the density of the population has increased during the last century:—

In 1801 there were 152 persons per square mile, or 4.20 acres per person; in 1851 there were 307 persons per square mile, or 2.08 acres per person; in 1901 there were 558 persons per square mile, or 1.15 acres per person. The average number of persons in each inhabited house in England and Wales in 1901 was 5.19, in London 7.3, and in Bradford 4.1.

Under the modern methods of development adopted in different towns for housing the artisan classes the average number of persons to the acre varies from 44 to 65 per acre. In Shoreditch there are about 180 persons to the acre.

In a scheme comprising first-class villas, the average would be probably four houses to the acre, or twenty to twenty-four persons.

The rule which housing reformers have endeavoured to follow is not to have more than twelve houses to the acre.

But unless special arrangements can be made as to road construction, and the land purchased for a sum not exceeding 300l. per acre, or 1s. 2d. per yard, such houses cannot be provided to let at rents of less than 6s. per week.

In Port Sunlight where the land cost 240l. per acre, or just under 1s. per yard, the total cost of each house has been as follows:—

Cost of land one-tenth of an acre at 240l., equals 24l.; cost of cottage, roads, &c., 330l.; total, 354l. This sum, taken at the moderate rate of 4½ per cent. to cover interest and depreciation, represents a net weekly rent of about 6s. 2d., and with repairs and other incidental expenses will amount to not less than 8s. per week. The actual rent paid is 5s., and the balance is made up out of the profits of the business. At Bournville, Mr. Cadbury has from the very first insisted that the rents should show a 4 per cent. return on the capital, with the result that the rents are not within the means of the poorer working men.

Our town-planning scheme, if not actually made in Germany, appears to have originated from there. The Germans have been the first to recognise the advantage of a general scheme of building development. Owing to the great increase of population and rapid development of trade since 1870, there has been remarkable extension of many towns.

The overcrowding of houses was much more pronounced than in this country. Taking ten of the principal towns in Germany in 1890, each house on an average was occupied by no less than twenty-nine persons (but "a house" in

Germany often includes a number of flats). In ten of the principal towns of this country the average was six.

In conclusion, I wish to thank my friends, Mr. Raymond Unwin, for the excellent plans of Letchworth and Hampstead, and Mr. Martin for the interesting plan of the Harborne Tenants Estate, which they have been kind enough to lend me. And last, but certainly not least, my sincere thanks are due to you, gentlemen, for the very patient hearing you have been good enough to give to my paper.

An interesting discussion upon the points mentioned in the paper followed, in which Messrs. W. Burn, E. B. Crossley, H. A. Dickman, F. W. Gordon, A. E. Heazell, C. Howitt, W. Smith, W. H. Taylor, and Dr. Wray took part.

After Mr. SUTTON had replied to the discussion, Mr. ROBT. EVANS, jun., said:—I hope in future the authorities will take more interest in the extension and laying out of our towns and cities, and by looking ahead will seize the opportunities for improvement as they occur. I am sure I am expressing your wishes when I propose that our very best thanks be given to Mr. Sutton for his trouble in preparing such an important paper, and for obtaining for our inspection the loan of so many typical town-planning schemes. Our thanks are also due to Mr. A. E. Heazell, who has also obtained a lot of information on the subject.

Mr. A. DALE in seconding the proposition said Mr. Sutton has given us a great amount of information as to the working of the Act, which will be very useful.

The vote of thanks received the support of the meeting.

BRISTOL SOCIETY OF ARCHITECTS.

A MEETING of this Society, open to members and their friends, including ladies, was held on the 9th inst., the President, Mr. Foster Wood, in the chair.

A lecture was given by a member and former Honorary Secretary of the Society, Mr. F. Bligh Bond, F.R.I.B.A., Diocesan Surveyor of Bath and Wells.

The subject treated was that of "Somerset Churches," and a very fine collection of about a hundred lantern views was shown. The lecturer was of opinion that the Perpendicular style and its transition from the Geometrical was developed in these churches at a very early date. So much so that Somerset may be regarded as the home of this phase, and it was probably carried thence by ecclesiastics to the Midlands, East Anglia, and other parts of the country. Another beautiful feature of the Somerset churches is that of the characteristic square towers built as a result of the wonderful perfection in campanology attained during the fifteenth century. Many interiors were illustrated and described specially with reference to the Celtic and Saxon types of planning as they affect the screening of the chancel and width of its arch. Examples were shown of Jacobean and Carolean screens, which, as at Crocombe, include praiseworthy attempts to replace, in measure, the work destroyed by the decree of Queen Elizabeth, who ordered all rood lofts to be taken down. Even some of the early Hanoverian work may be considered fairly harmless, but anything later than the first George was usually incongruous and debased.

On the motion of Mr. G. C. Lawrence a very hearty vote of thanks was accorded to Mr. Bond for his lecture.

ILLUSTRATIONS.

BROCKHURST, EAST GRINSTEAD, SUSSEX.

WE this week illustrate some of the details of Mr. MAURICE E. WEBB's work at this house, of which we gave general views and plan in our last issue.

TRAVELLING STUDENT'S SKETCHES.

WE give reproductions of two more of Mr. WALSH's drawings, made during his tour as our Travelling-Student last year.

THE BILLIARD-ROOM, SILVERDALE, KINGSTON HILL, SURREY.

THIS is from a pencil sketch of the interior of a billiard-room lately added to a house at Kingston Hill for Mr. O. E. Burton. The building is of Georgian character, Crowborough bricks being used, and the roof covered with Wrotham red hand-made tiles. The work has been well carried out by Messrs. G. P. and H. BARNES, builders, of Streatham Park, S.W. The architect is Mr. BURKE DOWNING, F.R.I.B.A.

THE HOPBIT, LITTLE BADDOW.

THE drawing of this unpretentious country house, by Mr. ARTHUR BARTLETT, F.R.I.B.A., was exhibited in last year's Royal Academy Exhibition.

THE ILLUMINATION OF INTERIORS.

By Professor J. T. MORRIS, M.I.E.E.

(Continued from last week.)

EFFECT ON EYE OF DIFFERENT MODES OF LIGHTING.

THE remarkable adaptability of the eye, which has already been referred to, is, as is well known, due to the powers of contraction which the pupil of the eye possesses, so that it can automatically cut down the light entering the eye, thus tending to keep the intensity of light

by noting the numbers of the graduations across the pupil obtained the diameter of the latter. An electric lamp was placed as shown in fig. 2, the angle between the line of the telescope and the rays of light falling on the eye being about 30°. A series of measurements of the areas of the pupil was then made at varying candle-powers: (a) when the eye was looking direct at the lamp, (b) when it was looking direct at the telescope. Three persons were experimented upon, and the results obtained are given in Table IV. Attempts to photograph the eye were not successful, owing to the fact that the size

FIG. 2.

falling on the retina more nearly constant. When faced by a very bright light the eye not only adapts itself by contraction of the pupil, as is well known, but the upper eyelid is also frequently used to reduce the light. In this con-

of the pupil is constantly changing, thus giving a blurred picture. It should be borne in mind that with low illuminations there is naturally great difficulty in ensuring accuracy in the observations, owing to the fact that the pupil cannot

FIG. 3.

nection the following experiment was made at the East London College:—

The person whose eye was to be tested held a transparent millimetre scale as close as possible to the eye. A second person looked at the eye through a telescope, and

readily be seen.* The figures, however, are given for what they are worth. Tests were also made in broad daylight.

* [There is an apparent error in the observation for Person II. at 0.70 candle-power, and the graph in fig. 3 is probably a more correct expression of the facts.—ED.]

TABLE IV.

5.6	300	—	—
C. Looking at white surface.			
B. " lamp.			
A. " 30° from lamp.			

An attempt to analyse still further these results is given in Table V., and shown graphically in fig. 4, where the product of area of pupil and the foot-candles

at the eye is plotted against candle-power. Had the graph been a straight horizontal line it would mean that the amount of light falling on the retina of the eye for all candle-powers was the same. This, however, is only approximately true, and only for brightly illuminated surfaces.

It would appear from these results that the area of the pupil of the eye must alter between much wider limits in the case of a rapidly fluctuating illumination for a feeble light, than for a brilliant one.

Further, the effect on the eye of the background against which the lamp is seen is of material importance. It is well known that if a lamp bulb is frosted the lamp when alight is more restful to look at than when the bulb is clear. It is not so well known that if a white background be placed directly behind the lamp this combination is more restful to look at than the lamp alone. To study this subject the following experiment was carried out: A naked 240-volt 45-c.p. Osram lamp was fixed at a distance of 10 feet from the observer, and was examined under three conditions by two observers—(a) the lamp alone, (b) the lamp with a plane mirror placed behind it, slightly inclined, so that both the lamp and its reflection could be seen, and (c) the lamp with a piece of white paper placed

close behind it. Both observers stated that (c) was decidedly the most restful arrangement to look at of the three. The areas of the pupils were measured, and the mean values for a number of observations gave the following results:—

- (c) Naked lamp, white paper behind . . . 110 %
- (a) " " alone . . . 100 %
- (b) " " with mirror behind . . . 85 %

It will be seen that not only is the lamp with the white paper behind it more restful to look at, but at the same time the area of the pupil of the eye is largest for this arrangement, and therefore more light enters the eye. Both considerations, therefore, lead one to the conclusion that of these three arrangements (c)—i.e. the naked lamp with the white paper behind it—is the best.

Possibly the greater restfulness noticed in the case of the white paper may be due to the fact that the dark spaces between adjacent lengths of brilliant filament are filled up with a brightly lighted surface. It would therefore appear that not only does the eye resent extremely sudden changes in illumination in point of time, but also it objects to extremely sudden changes in illumination in point of space.

(To be continued.)

THE ARCHITECTURAL ASSOCIATION.

AN ordinary general meeting of the Architectural Association was held at Tufton Street, W., on Monday last, January 9. The nominations of Mr. W. J. Allcorn, Mr. H. G. Wicks and Mr. G. W. Cape were announced; also the election to membership of Mr. Raymond Unwin and Mr. A. O. Hector, and the reinstatement of Mr. A. S. Dorrell.

Mr. ARTHUR KEEN, the President, announced that the first Spring Visit will take place on Saturday, January 21, to the Law Courts Extension.

Mr. H. H. STATHAM then read the following paper entitled:—

Architecture Considered as Plan and Section.

Many years ago there appeared in the *Westminster Review*, in the days when that periodical was an intellectual power in the land, a remarkable article on "Winckelmann and Greek Art," which to some extent coloured my feelings about art for the rest of my life. The author, as I learned long afterwards, was Walter Pater, and the article was probably his earliest essay on æsthetic subjects. In the course of it, speaking of the distinction between architecture and the arts of sculpture and painting, he said:—

"The arts may thus be ranged in a series, which corresponds to a series of developments in the human mind itself. Architecture, which begins in a practical need, can only express by vague hint or symbol the spirit or mind of the artist. He closes his sadness over him, or wanders in the perplexed intricacies of things, or projects his purpose from him clear-cut and sincere, or bares himself to the sunlight. But these spiritualities, felt rather than seen, can but lurk about architectural form as volatile effects, to be gathered from it by reflection; their expression is not really sensuous at all. . . . Architecture is the mode in which the artistic effort centres."

Here was a totally abstract conception of architecture, as the walling up and covering in of a space, and as capable of poetic expression from that point of view alone, independent of any considerations of style or detail. That sentence, "He closes his sadness over him, or wanders in the perplexed intricacies of things," has haunted me ever since. If you come down to the primary elements of architecture, does it not consist in laying out a plan in an effective manner, and in covering in that plan in a manner at once effective and structurally sound? I am asking you to consider architecture this evening from that point of view. There is a moral connected with it; but the moral, according to traditional usage, comes at the end.

No architect worth the name ever lays out a plan without having present in his mind at the same time the manner in which he means to roof it in; and the mere aspect of a plan on paper at once sets the mind thinking as to what the section of the building would be. But even apart from that consideration, a plan, merely as plan, has its own expression and its own suggestiveness. Does not the typical Egyptian plan at once suggest an architecture of solemnity and mystery, in which the whole plan is an anti-climax, and the mystery narrows and closes round us the further we penetrate into the recesses of the buildings. How striking it is, too, to compare the typical plans of the Egyptian, the Greek, and the Gothic temple! Is not the prevailing character of the religions to which they are dedicated expressed in the three plans? The Egyptian the plan of mystery, closing in the more as you enter it, and showing nothing externally but the entrance pylons and a blank wall; the Greek the plan of rationalism—a columnar display on the exterior, and a wide interior plan neither enlarging nor diminishing as you enter it; the Gothic the plan of aspiration, widening and enlarging to its inner and more sacred extremity. Even in comparing the archaic Greek temple with the Parthenon, we see the progress from the long narrow *cella* of Selinus to the broader one of the Parthenon, significant of the development in the direction of a more cheerful and rational religious rite.

The three types of plan referred to just now tell their own tale as to roofing. The Egyptian and Greek plans are manifestly the plans for flat roofing; the small inner apartments in the Egyptian plan might be vaulted, but there can be no sense in the forest of columns distributed over the floor of the larger halls except to uphold a flat roof; and the Greek *cella* shows no abutment for an arched roof. The Gothic plan, on the other hand, proclaims the preparation for the arched roof; we see the change in the walling, from Romanesque to Gothic, as the vault is adopted and the masses of wall pivot about and take their stand at right angles to the thrust of the roof.

As an example of the crude fashioning of a plan without any order or any dominant idea, and also of the effect of roofing upon plan, we may take Khorsabad. This is a mere warren of straggling apartments grouped on no system; it is true that this was a palace for habitation, not a temple; but why are the rooms all long and narrow? Because they were roofed by a crude system of vaulting, erected without centering, and which could not be carried out over a wide space. This is essentially an uncivilised plan. What a difference when we turn to the plan of Spalato, with its wide spacing and symmetrical arrangement! In this latter point, however, it is surpassed by the plan of the Escorial, in which the great church, which is the prominent feature, is more centrally placed than the temples at Spalato, giving a greater effect of climax. The architecture of the Escorial, it is true, is cold and uninteresting. Herrera had laid his deadening grip over the classical revival in Spain; but the plan is a magnificent one—almost inspiring in its very appearance, and it might be built over again as one of the finest things in the world. It would not be a bad subject for the Tite Prize to give the competitors the plan of the Escorial and the mission to treat it in the best Italian manner they could. Another example of a great plan is Inigo Jones's Whitehall Palace, one of the finest schemes for a great palace that has ever been conceived, like the Escorial, impressive even on paper; notice especially the splendid idea of the columned circular gallery as the State approach to the private apartments of the sovereign; an idea unique, as far as I know, in architecture. If anyone objects (as many certainly would have objected thirty years ago) that the executed portion of the building is too cold and formal in style, I reply that that does not affect the grandeur of conception of the plan. But, in fact, Inigo Jones's severe and scholarly style of classic architecture was exceedingly suitable to the dignity of a great royal palace, and had his design been carried out London would have possessed the greatest Renaissance building in the world.

One has only to turn to the plan of Versailles to see how an architect who was not a great genius could spoil an even finer opportunity. For a great royal château Versailles has an absolutely ideal position, with the great courtyard rising with a gentle slope up to the entrance front, and the other façade overlooking from a wide terrace the finest park in the world. But there is nothing great about Versailles except its situation. The detail is dull and mechanical; but even were it better the treatment *en masse* would have spoiled it. This largest palace in the world is entered in a corner, and does not contain a single staircase of spacious and monumental effect, and half the effect of the park façade is lost by the blunder of bringing out the centre block in an immense projection, so that from no point of view can one get the effect of the whole length of the façade. A very long façade may be accentuated in the centre by a slight projection, but to thrust a great mass of building out from the centre is fatal. Any projections on such a scale should be at the wings, not at the centre.

Versailles, in fact, is an immense plan with no leading or dominant idea except that of mere size. For a large plan to suggest anything impressive in the design, as a whole, there must be a dominating feature in plan which suggests a dominating feature in section. If, for instance, that square projection in the park elevation of Versailles had been a great hall crowned by a dome which would be seen from the park, as the principal object, the remainder of the building forming a background to it on the second plane, there would have been some reason in it; as it is, there is no recognisable motive. It is the same generally with any form of plan which appears to have no suggestion for special treatment of any portion of it. The Egyptian columned halls, as already observed, naturally suggest a flat roof; the one point of effect suggested is in those hypostyle halls which have the two ranks of larger columns down the centre; there we at once expect some such sectional effect as is supplied by the clerestory lighting above the smaller columns. In such a plan as that of the so-called Hall of Xerxes at Persepolis, with equally spaced columns all over the floor, there is no suggestion for any effective design in section; it is obviously a flat-roofed building, which may have had, as shown in Mr. Spiers's restoration, a general expression of palatial magnificence, but with no one point to attract the eye more than another it hardly represents an architectural thought at all; it is an architecture of mere interior display. The typical plan of a mosque, as seen in the plan of Ibn Touloun, is an example of another kind, of the equal distribution of points of support with no leading feature. This was for practical reasons. A mosque, it must be remembered, is not a temple in honour of the Deity; in the

Mahomedan creed, "the most high dwelleth not in temples made with hands"; it is simply a shelter and a place of seclusion for the worshippers, who especially congregated at the inner end of the enclosure, to pray in the direction of Mecca; consequently this portion was to be completely covered in, but for practical, not for architectural reasons; so that the equal distribution of points of support supplied all that was wanted. At Cordova the idea was carried further, and the whole area covered in, with great richness of decorative treatment; but the idea was still the same; it is a shelter, not an architectural temple. After the Turks took Constantinople in the fifteenth century, and converted Hagia Sophia into a mosque, they got tempted by the grandeur of this building into giving a new architectural grandeur to their mosques; but the mosque originally was merely a shelter, and was designed as such, and consequently presented no basis for a great and complete architectural conception.

In the Christian church there was from the first a leading idea in the special importance and sanctity of the east end (using the word in its ritual sense, for many of the Italian churches were not orientated). But the plan and section of the early Basilica church suggested no special architectural motive beyond that of the perspective effect of a colonnade or arcade leading up to the apse. If we take the plan of the old St. Peter's Basilica, there is nothing in it to suggest anything in the architectural treatment beyond the very plain and simple section which is familiar to us in illustrations. Here the transept is only a practical provision for subordinate apartments, and has not yet assumed any architectural importance. With the development of the choir and transepts the crossing became architecturally the dominant point of the design. As Fergusson quite truly remarked, the weak feature in the mediæval plan was that this central space was so small. Its accentuation in section clearly pointed to the employment of a high and towerlike structure, since the width was not sufficient for effect with anything in the shape of a domical covering. The architect of St. Sernin at Toulouse, in the Romanesque period, hit upon the real way to treat it with the class of detail in use at that time; and later the same thing was done, in equally fine style, but with different detail, at Salisbury. The introduction of the octagon crossing plan at Ely was a manifest improvement in this portion of the plan, and the design of the exterior lantern (though unfortunately not in monumental stonework) just expresses it; in this case a central spire would be out of place and contrary to both plan and structure. In England we have always retained the practice of treating the crossing as the point to be accentuated in the exterior design; an advantage which the French for the most part lost through their passion for internal height, which rendered any great erection on the crossing too dangerous. It is a question whether the more limited height of our cathedrals, with the advantage of the central tower and spire, did not produce better and more interesting architectural results.

Though the finest of the French cathedral plans are superior to the long, narrow English plan, in their effect of climax, as at Rheims, produced by the widening of the plan towards the east end, there is perhaps a greater variety of interest and suggestiveness in the English cathedral plans. And here we again come to see that the plan of a cathedral is in itself significant of the character, of the greater or less architectural interest, of the building. Bourges, for instance, is an uninteresting and prosaic plan, with no specially suggestive point. We cannot look at the plan of Florence Cathedral, with its bare, wide spacing of the piers, without instinctively feeling in it something of the hard, unsympathetic character of Italian Gothic, as compared with the more rich and picturesque character of French and English Gothic. Sometimes, again, we come on a plan which represents a distinct and uncommon idea, quite apart from the general type; as, for instance, at Charroux, with its remarkable choir on a circular plan. A still finer instance, and more suitable, too, for the ritual use of the church, is the grand plan of St. Gereon at Cologne, with its elliptical nave and the long choir opening out of it. Hardly any detail could prevent that being a fine interior. Tournai, with its apsidal terminations to the transepts, is another striking instance of special interest and character in the plan, considered merely as a plan, whether the style were Gothic or Renaissance.

When we come to consider domed churches, we recognise that, in connection with plan, they fall into two classes—those in which the dome is the main covering of the whole or the greater part of the centre of the area, and those in which it is the accentuation of a special open space which

forms only a portion of the plan. San Vitale is a celebrated church of the first-named class, which has, to my thinking, the drawback that no exterior dignity is obtained from the central dome; it is practically an internal architecture only, a defect which it shares with the greater Byzantine church at Constantinople. With all that provision for buttressing on the plan of San Vitale, something more might surely have been done with it than merely to build a thin dome as an interior shell, with a low-pitched roof over it. A magnificent example of the central dome plan is the church of the Madonna di Vico in Piedmont, which was, I believe, little known until a few years ago an enthusiastic admirer, Mr. Melano Rossi (an American with an Italian name), published a history and illustrations of it. The plan promises such splendid opportunities of effect that one gets a kind of inspiration from the mere sight of it. The plan was that of an Italian engineer-officer, Captain Vitozzi, who commenced the building in 1596; but it was not covered in till more than one hundred years after, by a young architect named Francesco Gallo; as in the case of St. Peter's, the doming over of the central area seems to have frightened two or three architects before it was finally accomplished. Whether all was done with so fine a plan as might have been accomplished may be a question; some of us may think we could have done better than that; and I should certainly like to know how Francesco Gallo managed to plant that large lantern on the top of this rather flat dome without coming to grief. It has stood, however, for three centuries.

The plan of St. Peter's as intended by Michel Angelo is of some interest, for it shows how much better a composition would have resulted if the building had been let alone instead of being lengthened out by Carlo Maderno. We should then have seen it as a pyramidal composition of which the dome was the main feature, instead of the dome being relegated to a back position in the composition, as seen on approaching the entrance façade. One weakness in Michel Angelo's plan, however, is that he has not made as much as he might have done of the apses to the transepts and choir; they are rather timid in line and proportion; we realise this at once on comparing it with San Gallo's plan, which in this respect is much bolder and finer. Why Michel Angelo, who was perfectly acquainted with San Gallo's design, should have chosen this less bold and effective treatment is perhaps explained by the fact that he was determined, whatever he did, to differ from San Gallo.

In considering the dome as the roofing of a special portion of the plan, one has to distinguish between the case of a single dome and those in which more than one dome is used. A single dome must, of course, be the covering and the accentuation of the most important portion of the plan. Where more than one dome is introduced it may be laid down that a dome is essentially a form to be employed in a square or transeptal form of plan, and not in a plan in long perspective. At St. Mark's and at St. Front, Périgueux, which probably drew its inspiration from St. Mark's, we see a principal dome at the centre, with subordinate domes grouped around it, each one the roofing of a square compartment; a perfectly suitable application of the feature. At such a church as Angoulême, a long church with a series of domes, the dome is a less suitable feature; the succession of domes interrupts and breaks up the perspective rather than assists it. The vault is the suitable form of roof for the long church, the dome for that which is developed from a square plan. Wren's first design for St. Paul's was, both internally and externally, the single-dome design, a great central space covered by a great dome. Taken as a whole, it is a far finer conception than the existing building, though in detail the model may not be in all respects equal to the latter; at all events, it shows nothing so charming as the present western towers. Externally, St. Paul's is still the single-dome design, but internally it is roofed by a series of smaller domes. I think it is impossible to turn from the original plan to that of the existing church without feeling that we are in presence of a plan very much inferior to the first one; a feeling in which I think Wren would have entirely concurred.

The importance of the element of plan is nowhere better exemplified than in the Houses of Parliament. There was a foolish controversy a good while ago as to whether Pugin or Barry ought to have the credit of the building, on the supposition that the Gothic detail was Pugin's. I doubt if the exterior detail was Pugin's, though he no doubt designed a great deal of the interior work. But the controversy was entirely beside the mark; the detail is the weakest part of the building. Its greatness consists in the grand simplicity of the plan, the centre octagon with the main corridors lead-

ing right and left to the two chambers, and in the great exterior composition of the two contrasted towers and the central lantern marking the position of the octagon; the detail is a secondary matter altogether. That plan has been copied in buildings of a similar class all over the world. The Buda-Pest Parliament House is almost a direct copy of it, with one additional point which our building wants—that the position of the two chambers is shown in the exterior design. Another example of a plan formed on similar lines is Mr. Ernest Flagg's fine competition design for the State House of Minnesota.

St. George's Hall at Liverpool is a fine example of a great comprehensive plan, the architect's intention in which was not altogether realised in execution. Elmes's idea was that the great central hall was to be a *salle des pas perdus* for the two law courts, which were to be at opposite ends of the hall, divided off only by curtains, and that there was to be a vast vista, at the opposite ends of which were to be seen the two judges sitting in state. Whether that would have conduced to the convenience or comfort of the courts was a question on which I am afraid Elmes did not trouble himself much; he thought only of a great architectural effect, and he was perfectly mad when he learned that his vista was to be closed at one end by a great organ-case. But it certainly was a grand architectural conception, whether convenient or not.

Among plans for public buildings, Bernini's plan for the great court of the Louvre is of some interest, from the effective manner in which he proposed to treat the re-entering angles of the quadrangle, by bringing them out and accentuating them in the manner you see on the plan. The inner angles of a great quadrangle are apt to be weak points in the plan, and Bernini's way of treating them is worth attention. To come to an existing example of well-thought-out and practical planning, there are few better things to be seen than the planning of the Birmingham Law Courts, by Sir Aston Webb and Mr. Ingress Bell; I believe the actual plan was Mr. Bell's personal work. It answered, I believe, all the requirements of the promoters, and you see how perfectly simple and straightforward and symmetrical it looks; but that kind of simplicity is not attained without much thought and trouble. There should be a centralisation, a backbone as one may say, in the planning of a public building. As an example of the contrary, you may take an excerpt from a competition plan for a public building, fortunately (as far as the plan was concerned) not carried out. The visitor going straight through the entrance porch is faced by a blank wall; or he may turn to the left and then to the right again to reach the crush-room through an arcade, the openings of which are not central with anything whatever. As exterior architecture the design was a fine one, but I confess I cannot understand an architect making such a plan as that.

Some of the old Renaissance mansions show the peculiarity of a close approach to symmetrical planning, but just missing it; Longleat is an example. It looks as if it had been meant for a symmetrical plan but had been drawn out in a hurry and wanted correcting. Blenheim shows the element of stateliness in planning carried, one might say, to an extreme; but in justice to Vanbrugh it should be remembered that Blenheim is what may be called a palace rather than a mere mansion; and in a palace, which is nothing if not stately, stateliness may exclusively be put before convenience. The symmetrical mansion plan, however, is apt to be a danger unless the interior arrangements will lend themselves to it. There is a plan by Mr. E. J. May—additions to Jardine Hall—which I have always admired, and which shows how a very stately effect may be given to an interior of a mansion on not a very large scale. By placing the dining-room and drawing-room at opposite ends of the house, connected by a wide corridor over 100 feet in length, he has provided for a kind of state procession from the drawing-room to the dining-room, giving the guests the impression of being in a larger mansion than they imagined. The only thing I complain of is that I think the mantelpiece projection in the dining-room, which would probably be of a monumental character, should also have been placed on the central axis of the corridor, so as to complete the vista from end to end.

As a warning, on the other hand, I may call attention to an extraordinary piece of planning taken from an actual (not recent) house. The drawing-room is cut into in a most awkward manner by a kind of promontory, the corner of which faces, not an answering pier, but the middle of a bay window, the men's lavatory is close to the dining-room door, and the door faces the hall and staircase in the most unblushing manner; the way for the dinner from the kitchen

is across the hall and past the lavatory door; and the window of the servants' hall is so placed as to overlook all visitors on their way up to the hall door. Those are certainly things to be avoided.

As a modern example of a plan which is in itself a new architectural idea, I would cite the buildings at Paris called the "Petit Palais" (though it is really a very large building), by M. Girault. This is entirely an original conception in plan; the front block forming a great straight gallery with a dome over the centre; the remaining portion of the plan forming two ranges of galleries are within another, the inner line of the building forming a semi-circular loggia round an interior garden court. This is a piece of real invention in architecture, such as we do not often meet with. The principal façade is a very stately design, and the semi-circular façade towards the garden is a very graceful example of the modern French type of classic architecture. But, as with our Houses of Parliament, the plan is what gives the building its real value.

Referring again to the idea that plan is in itself an expression of architectural design, I would suggest that even a block plan may be so regarded. When, some fourteen years ago, the Institute of Architects did me the honour to ask me to read a paper on the question of the sites for the Government Offices, I put my own idea on the subject into a block plan, which received such flattering notice from speakers at the meeting that I may perhaps be excused for feeling a little proud of it. My idea was that the Admiralty was to be completed as three sides of a quadrangle, the First Lord's house forming a central object on the fourth side of the quadrangle, with a screen colonnade on each side of it. The War Office was to face the Admiralty with a somewhat similar quadrangle, and the Commander-in-Chief's residence, or his Staff Offices, responding to the First Lord's house. An important sculptural war monument would occupy the centre of the roadway between them. All the west side of the street north of the Admiralty was to be set back so as to render it the same width all the way up, and bring the axis of the street to join the centre axis of Trafalgar Square at a point marked by the Charles I. monument, which would only require to be shifted a few yards to come into the scheme. That was what I thought might have been done if the Government could have been persuaded to spend money to do the thing on a grand scale, worthy of the nation. An important point in my mind was that a great national building of this kind should make a *place* for itself, and not merely follow the street lines. The French Government would have realised that; our Government only considers economy of building land, and so the War Office has actually been built in an irregular shape following the street lines, as if it were only a monster hotel which was to make the greatest commercial return out of every yard of ground. My suggestion was, of course, hopeless with an English Government, and never went further than the block plan; but I think you will admit that the plan constitutes an architectural idea.

And now for the moral. We have stretching for a century behind us the battle of the styles, less active and exacting now than it used to be, but still not by any means extinct. Most of us are still troubled with searchings of heart as to which style is the right one for permanent adoption; one of the considerations in working out a design for a new building still is—consciously or unconsciously—"What style shall it be in?" I am proposing to deliver you from all this, once for all, by recommending you to adopt a view of architecture in which detail, in a sense, does not matter. Professor Lethaby some time ago proposed that we should solve the problem by hunting down, as he expressed it, all the accepted detail, and beginning again with no details or mouldings, and see what we arrived at. I think that is rather too stern a gospel for general acceptance, and, moreover, that we are much more likely to come on interesting and original detail by developing on traditional lines than by evolving detail out of our inner consciousness. What I want to suggest is not, of course, that good detail is of no consequence, but that, provided it is good of its kind, it really does not matter what kind you adopt so long as the main conception of the building is a fine and effective one; and that the effect of most of the great existing buildings of the world depends on their general conception, and is to a great extent independent of the style of detail. Take, for instance, the plan and section of Palladio's Church of the Redentore. That is a church with a series of deep side chapels, and a dome covering the centre space between three semicircular tribunes. The side chapels are divided by decorative classic columns, but you know well enough that those are not essential but accidental; the essential con-

MODERN EUROPEAN ARCHITECTURE.
GERMANY.

THE CHARLOTTENBURG BRIDGE, BERLIN.—Professor SCHAEDE, Architect.

[From *Der Profanbau*

ception is a series of deep bays at the sides of the nave, and a domed centre flanked by semicircular spaces; the columns and the other classic details are not necessary to it; the same general conception might have been carried out with half a dozen different forms, and still have retained its essential character and remained a fine architectural conception. Or take the Pantheon, one of the finest conceptions in architecture; what has the classic Order essentially to do with that? In this case the detail actually spoils the main result; the Order is too small for its position and seems crushed by the superstructure. The plan and section, in other words the same leading idea, might have been carried out with much finer effect with a detail entirely different from this. Or, to refer once more to the great building which is nearly within a stone's throw of us, I put it to you that if, by the wave of an enchanter's wand, you could in a moment transform all its Tudor detail into Renaissance, the Houses of Parliament, in all the qualities which make its real architectural greatness, would still remain just what it was, and its claim on our admiration would be in no way affected. In short, the delivery from all this imaginary bondage of styles lies in the recognition of the fact that the essential element in architecture is the embodiment of an idea expressed in plan and section.

UNIVERSITY OF LONDON LECTURES ON
ARCHITECTURE.

MR. BANISTER F. FLETCHER, F.R.I.B.A., has resumed his course of lectures on Ancient Architecture, which (by kind permission of the Trustees) is being delivered at the British Museum. The opening lecture of the Lent Term dealt with a general analysis of the Roman style, showing its development from Etruscan origins together with influences from Greece. Etruscan architecture dated from 750 B.C. to 100 B.C. Roman, from 100 B.C. to 300 A.D.

Stones and bricks were used, but the main feature of Roman construction was concrete which, owing to its great strength and durability rendered possible the erection of buildings such as the Colosseum and the dome of the Pantheon. Granites from Egypt, basalt, porphyry, white and coloured marbles, alabaster, &c., were largely employed, as

well as native tufa, peperino, and travertine. We are told by Pliny that granites and stones were imported to Rome in large quantities, special wharves being constructed on the banks of the Tiber to receive them.

The religion of the Romans was similar to that of the Greeks; they worshipped the same series of Olympian deities, giving them different names, but to this was added their own ancestral worship of Lares and Penates and local cults such as those of Vesta and Egeria. The foundation of Rome is said to date from 750 B.C., and the town was governed by kings until 500 B.C., when the Republic was set up, lasting until the establishment of the Empire by Cæsar Augustus, 27 B.C., under whom building activities flourished, and were continued by the later Emperors Nero, Vespasian, Trajan, Hadrian, Septimius Severus, Caracalla, and Diocletian. In 343 B.C. Rome began her conquest of Italy, a work which took about sixty years. In 330 B.C. Etruria became a Roman state. After the first Punic War in 264 B.C., Sicily was made the first province of Rome. The third Punic War (149-146 B.C.) resulted in the destruction of Carthage, consequent on which Northern Africa became a Roman Province. Syria, Asia Minor, Spain, Greece, Western Asia, France, England, and Egypt all fell under the Roman arms and became Roman provinces between 190 B.C. and 30 B.C.

What we know of Etruscan architecture consists chiefly of tombs, city walls, gateways, bridges, and aqueducts, and these resemble in character the Early Pelasgic work at Tiryns and Mycenæ. The walls are of cyclopean masonry, and put together without mortar or cement of any kind. The main feature of Etruscan architecture is the early knowledge and use of the true or radiating arch. Before this time the arch made of bricks or stones laid in horizontal courses was the only form in use, as at the Treasury of Atreus.

The Cloaca Maxima at Rome, dating from about 578 B.C., is an excellent example and possibly the oldest true arch construction known.

It is a semi-circular vault with a span of 11 feet, and 12 feet in height, constructed mostly of peperino. It is the great sewer of Rome which carries off the water from the Forum, and drains the valleys of Rome. It is constructed of three rings of voussoirs each 2 feet 6 inches in height.

The Arch of Augustus at Perugia is another example. It is an oblique arch constructed of large blocks of travertine without mortar, and formed part of an Etruscan wall $1\frac{1}{2}$ miles in length. Augustus restored the arch after Perugia was destroyed by fire, hence its name.

There are no remains of Etruscan temples other than those found at Lanuvium (Italian—Civita Lavinia, Civita Castellana, Luna, &c.), consisting chiefly of terra cotta roof tiles decorated in colour, examples of which are to be seen at the British Museum. But to Vitruvius we are indebted for the description of a three-cell temple, dedicated to a trinity of gods, a custom which prevailed as in Egypt. The Etruscan temple was raised on a high podium which survived in the Roman rectangular temple. It was non-peripteral, thus differing from the usual Greek example, but had a prostyle portico and a flight of steps. There is at the Villa of Pope Julius at Rome a reproduction of an Etruscan temple, the remains of which were discovered in 1882 at Alatri.

Large tumuli and rock-cut tombs, the latter sometimes representing the atrium of an Etruscan dwelling, the rock being carved to represent the roof timbers, are among the remains of Etruscan examples left to us.

Roman architecture was a development of the arch and vault of the Etruscans, and the "orders" of the Greeks, which, however, were used more decoratively than constructively, as they were placed one above the other and applied to concrete walls, allowing these to do the carrying work. Two new orders were invented, the Tuscan and the Composite, bringing the number to five.

Concrete formed a most important part in all Roman construction as seen in the thermæ, amphitheatres, basilicæ, tombs, aqueducts, bridges, temples, houses, and palaces, the coverings alone of which could never have been constructed but for its strength and enduring powers, combined with the fact that there is no thrust from a concrete dome. In Carthage immense vaults of concrete, now used by the peasantry as dwellings, were formerly great stores for water; these again show its use for covering large areas without support. Concrete walls were usually faced with brick, and this again in many cases with stone, marble, or stucco.

The barrel or waggon-headed vault soon developed into the cross vault, by the intersection of one semi-circular vault by another, which cut it at right angles. This divided the long barrel vault into square compartments, enabling light to be admitted into the building. The intersection of the two vaults formed a groin, and it is held that this was built up of brick and served as a support for the concrete filling. The soffits of vaults were richly coffered, which considerably lessened their weight.

The dome of the Pantheon covers a span of 142 feet 6 inches. It is built of bricks laid in courses, almost horizontal, with thick mortar joints, and cased in concrete.

The "orders" were dealt with by the lecturer in detail, views of baths, temples, &c., serving as examples. Mouldings and ornaments were compared with the Greek, the former usually being parts of circles in profile, and less refined in conception and execution. In later examples every member was carved, which resulted in an overcrowding of detail in a desire for richness of effect.

OUR CONTEMPORARIES FROM OVERSEAS.

THE *American Architect* (New York) has given illustrations of the City Hall, Chelsea, Mass., of which Messrs. Peabody & Stearns are the architects; and the Public Library and the Winsor School at Brookline, Mass., both by Mr. R. Clipston Sturgis. The final number of the year is entirely devoted to the very excellent ecclesiastical work of Messrs. Cram, Goodhue & Ferguson, with an inspiring address by Mr. Ralph Adams Cram on "Architecture as an Expression of Religion," delivered before the twenty-eighth Church Congress of the Protestant Episcopal Church in the United States.

La Construction Moderne (Paris) illustrates two of the façades premiated by the City of Paris in 1909: No. 77 Avenue Parmentier, by M. Mourzelas; and the other No. 11 Rue Pillet-Will, by MM. Cassien-Bernard and Paul Friésé. As an example of Old Paris the Rue Sainte Croix de la Bretonnerie is described and illustrated.

Arkitektur og Dekorativ Kunst (Christiania) has an illustrated article on the west front of Trondhjem Cathedral and Herr Nordhagen's work thereat, also an illustrated description of the public baths at Darmstadt.

Het Huis (Amsterdam) completes its series of articles on Old and New Enkhuizen, and includes also illustrated articles on Norwegian tapestry and Hindu sculptures from the Siva temple at Tjandi-Praubanan, Java.

Der Architekt (Vienna) illustrates several "one-family" houses in the XIIIth bezirk of Vienna, besides a competition design for shops and flats in Königgrätz, so that the number is quite domestic.

Moderne Bauformen (Stuttgart) is chiefly occupied with the works of Munich architects. Barracks by Herr Sigismund Göschel are not devoid of architecture, but well-designed and stately buildings. Other Munich architects whose buildings are illustrated are Karl Jäger, Otto Baur, Professor Rich. Berndt, Karl Bertsch, Professor Adalbert Niemeyer, Professor Richard Riemerschmid, Paul Wenz, Professor Emanuel von Seidl, Professor Max Littman, Paul Ludwig Troost, Theodor Veil. Most of the designs are more or less influenced by "neubau" feeling, but with some regard for traditional motifs.

Stone (New York) gives an account of a terrible disaster to a reinforced concrete building at Cleveland, Ohio, when a four-storey building collapsed, killed four people, and severely injured eight others in an adjoining two-storey brick building which was crushed by its falling neighbour.

Engineering Record (New York) has an editorial note on the architectural criticisms of St. Paul's Bridge, which strongly upholds the position taken by the Royal Institute of British Architects. Such support from an unbiased and independent engineering journal is gratifying.

[The Editor will not be responsible for the opinions expressed by Correspondents.]

Ruislip Manor Competition.

SIR,—Your comments on the selected designs are admirable, but one point in connection with the competition appears to have escaped your notice.

Sixty-two or three designs were submitted, but only about fifty are exhibited, and had you been assessor one of the missing dozen (No. 23) would perhaps have pleased you.

The author of this did not "dodge the difficult slopes," but his main roads had a maximum gradient of one in forty; and where symmetry was introduced it did not involve "one-half of his pattern running uphill and the other down."

Twenty-three and a half acres provided thirty-three distinct sites for public offices, public hall, theatre, concert hall, places of worship, schools (elementary and secondary), institutes, public library and a hospital.

Seventeen acres for shops at four points.

Twenty-five acres for trade purposes such as garage, laundry, builders' workshops.

Eleven and a half acres for the same, or Territorial drill ground, and electric power station, leaving a net area of 873 acres for purely residential purposes with:—

78 houses at	1 per acre =	78 acres
150 " " 2 " "	=	75 "
200 " " 4 " "	=	50 "
450 " " 6 " "	=	75 "
2,289 " " 7½ " "	=	319 "
1,780 " " 10 " "	=	178 "
1,257 " " 13 " "	=	97½ "

(the large playgrounds are additional)

6,204 on 872½ acres

or an average of very slightly over 7 houses per net acre.

250 would be provided over the shops.

6,450 houses in all.

There is another very important matter on which you do not touch, and it concerns both the æsthetic and commercial sides of the problem.

(a) If I buy 120 acres of land at 100l. an acre it costs me 12,000l.

(b) If I set aside one-third (40 acres) for roads and open spaces I have to ask 150l. an acre for building sites to get my money back.

(c) If I set aside one-half (60 acres) for roads, &c., I have to ask 200l. an acre to get my money back.

(d) If I propose that the estate as a whole should carry

500 houses (to simplify the argument, of equal size) there will be 500 on 80 acres in (b), and 500 on 60 acres in (c). Which will sell best?

The (c) plots will each cost exactly the same as the (b) plots, viz., 24*l.* each, and will be much smaller, and the occupier will have to pay increased rates, or private subscriptions for the upkeep of the extra 20 acres thrown into roads or open spaces.

The smaller and dearer plots, of course, mean houses closer together, and shorter frontage, and the estate reverts towards "town" type instead of open country or "garden suburb" type.

The plans exhibited can show but little of this. The reports accompanying them must be searched, and at the time of the writer's visit the reports of the premiated ones were not on view, but from information published elsewhere it is noted that that placed first had near 1,200 more houses on 120 less acres, when compared with "No. 23" referred to above.

But, if we assume that Messrs. Soutar's "pattern" is the best of those exhibited, another still more important point yet remains. How are prospective occupiers to get there? Two-thirds of the estate is quite away from the railway. Northwood and Northolt stations are as far apart as Chalk Farm and Vauxhall. If any one ventures to make the journey from the City to Plots 31 and 35 Copse Wood, or Plots 31 and 35 in Park Wood, and realises that this will have to be done twice a day by the majority of occupiers, I anticipate that he will think twice before he takes up shares in Ruislip Manor, Ltd.

But the most amazing thing of all is that of the fifty exhibited designs, none show any attempt to provide communication without change of vehicles between Copse Wood or Park Wood and the City. One of the best suggests a tramway from the reservoir to Northolt station, and thence by main line train to Marylebone or Paddington, and yet further journey by electric underground. Is that good enough?

I venture to predict that long before the best parts of the estate have houses on them there will have to be a railway similar to that shown upon

DESIGN NO. 23.

[Our correspondent appears to have designed a "town" rather than what our reviewer called a "pretty pattern." The absence of competitors' reports is always a bad feature in competition exhibitions, but particularly so in this instance, as the essential merits of any design for a town can hardly be understood from drawings alone, and no doubt other competitors have realised the weak point about Ruislip Manor to which our correspondent alludes, and have suggested in their reports means of obviating it. As our reviewer noted, "catching the train" will be an important question with residents on the new estate.—ED.]

SIR,—In reading your excellent report on the Town Planning Competition for Ruislip Manor, I am very pleased to observe the emphasis you lay upon the want of value of pattern-planning, or, as I have ventured to term it before now, "the want of value of planesthesia."

It is really extraordinary that so many architects should be led astray on this point.

As you truly observe, "If the town were to be laid out on a level plain. . . its streets might as well be so disposed as not." But to disregard contours and levels for the sake of pattern-making is unworthy of a learned profession. Only to the extent that axiality and radiality serve a practical purpose should they be paid heed to.

The merits of town-planning are very far from being so pronounced as enthusiasts suppose, and I will venture to prophesy that, the first "vogue" engendered by the recent Act of Parliament once departed, we shall hear but little more of a fad that only a Radical Government could have fathered.

—Faithfully yours,

PERCY L. MARKS.

Albert Buildings, 49 Queen Victoria Street,
January 6, 1911.

PS.—I fear your correspondent "Piano-Player" will find it difficult, except by means of heavy expenditure upon abnormally thick walls, to confine sound. Has a vertical layer of slag-wool behind the plaster been tried?

SIR,—In your review of the designs submitted in this competition, and which are now being exhibited, you say in reference to my scheme that "some of the sewers seem to run uphill."

Your reviewer is evidently under the impression that all the sewers would be laid parallel with the present surface of the land, but this, of course, would not be possible; and I am

sure if you look into the matter more closely that you will find that the whole of the sewers have proper falls provided to the lowest point on the estate in each case.

I shall be glad if you will insert this letter to correct the erroneous impression created by your criticism.—Yours truly,

PERCY B. TUBBS.

68 Aldersgate Street, London, E.C.: January 10, 1911.

Llandrindod Pavilion Competition.

SIR,—I see by an advertisement in the professional papers that the Urban District Council are again advertising for competition designs for a pavilion. This is for the third time, and I take the opportunity, as a victim in the two previous competitions, of warning architects to beware.

The first advertisement appeared in October 1901, and the second in November 1907.

In the first a local architect (working jointly with the surveyor) was honoured (?) with selection, and after a great deal of wasted energy and expense in the preparation of many drawings the scheme was abandoned, and, I believe, without even a penny ever being paid for their trouble.

Five years later another advertisement appeared, asking for designs, a copy of the instructions being sent to me, although I made no application for them; but as I competed before it was supposed I might be willing to do so again, which I unfortunately was. Thinking matters might have arranged themselves fairly, I joined with the local architect who was successful in the first competition, and we acted jointly in preparing a design which was actually selected at a meeting of the U.D.C. by a large majority "for further consideration." One of the clauses in the instruction to competitors stipulated "that all designs were to be delivered *free of cost unsigned*, but each set to be accompanied by a sealed envelope bearing outside the nom de plume corresponding with the one on the drawings." To all architects accustomed to competition work this implied that secrecy was to be maintained till a selection had been finally made, and, in fact, was a virtual contract to that effect. But what happened was that as soon as our design was "selected for further consideration" it seemed to occur to the Council that they must be careful not to make any mistake, so they decided to have the envelope opened before "further consideration" put the business in the wrong hands. This was, I consider, a breach of the implied contract; and although I protested against it at a later date, they were advised that another clause of the instructions protected them from liability.

The result of the second competition was that the scheme was knocked on the head. Nine designs were returned to their authors, after being held at the Clerk's office for about nine months, and were so much waste paper, though each must have cost at least 25*l.* to prepare. But before they were returned the U.D.C. proposed to have a scheme carried out by their local surveyor, who was to prepare drawings. Now, after a considerable lapse of time apparently even this has fallen through, and the architectural profession is being invited to submit a further collection of designs for the amusement of this most enlightened Council. Surely twelve sets of drawings costing at least 300*l.* ought to be the limit of what they can expect to get without paying a penny for all the information they might have gained, and I hope all members of the architectural profession will think so, too.—I am, yours truly,

JOHN HENRY WILLIAMS.

15 Foregate Street, Worcester: January 9, 1911.

Petrol Air-Gas.

SIR,—In your issue of October 7, 1910, Professor Smith mentions the danger of storing inflammable liquids for petrol air gas machines, and suggests that reasonable care would reduce the risk to a minimum.

Will you allow me to suggest that the risk may be almost entirely eliminated by the "Snercold" system of storing and handling petrol, &c., for all purposes? The system adopted consists of an easily fusible safety plug, the solder of which melts at 157° Fahr. to prevent bursting of an enclosed tank, and a specially protected wire gauze cylinder to prevent back-fire and explosion. There is, of course, a free flow of spirit through the meshes of the gauze. I believe it is usual to fix a small protected gauze cylinder to the outlet of the tank as well as the filling opening, so that the tank is safe under all conditions.

I have seen most conclusive demonstrations of these devices in the neighbourhood, and feel sure that they are all that is claimed for them. I do not think this system is known as widely as it should be.—I am, dear Sir, yours faithfully,

T. D. PARR.

FORTHCOMING EVENTS.

Friday, January 20.

The Leicester and Leicestershire Society of Architects : Presidential Address by Mr. W. M. Cowdell, to be followed by a musical evening.

Saturday, January 21.

Architectural Association : First Spring Visit to the Extension to the Law Courts, Strand, by permission of Sir Henry Tanner, I.S.O.

Monday, January 23.

Architectural Association : Mr. Theodore Fyfe on "The Atelier v. the Builders' Yard."
The Surveyors' Institution : Mr. W. R. Baldwin-Wiseman on "The Conservation of our National Water Resources."

Wednesday, January 25.

Northern Architectural Association : Address by J. S. Gibson, Esq., Past Vice-President R.I.B.A., on "The Policy of the Royal Institute and the Advantages of the New Class of Licentiate."
Carpenters' Company : Mr. T. Raffles-Davison on "Truth in Craftsmanship."
Manchester Society of Architects : Mr. J. L. Ball on "The East Anglian Cathedrals."

STUDENTS' DRAWINGS AT THE INSTITUTE.

FOR the Soane Medallion and 100*l.* (for Continental travel) the subject set was a design for an entrance gateway to a capital city. There were thirteen competitors. The first prize was awarded to Mr. P. MAWSON, London ("Civitas"), and the second and third places to Mr. C. PERCIVAL WARGATE ("Mauerthor") and Mr. A. DOUGLAS ROBINSON ("SLIab") respectively.

It is a sign of the times that of the thirteen designs submitted for the Soane Medallion not more than one ventured on any approach to mediæval treatment, and yet the subject as set would be almost impossible at any later date than the seventeenth century, and scarcely even likely in that. Fancy the entrance-gate to any city of modern times being on the opposite side of a river approached by a bridge. No capital city on a river has its entrance on one side with a bridge across from the open country. Lisbon and Oporto are the nearest resemblances to such a disposition, and there the river is the approach, not a bridge. Pest is certainly all on one side, but Buda is on the other, and the two are virtually one city. Thus the competitors were set a problem in the architectural conception of Never-never Land, or, as the author of the design placed second expressed it, to design "La Porte de l'ancienne Ville Jamais."

This gentleman, Mr. C. P. WARGATE, seems to us to have grasped the meaning of the problem as set better than any of the other competitors, and if his design had been rather more thoroughly mediæval and the bridge and gateway more harmonious and consonant in feeling would, in our opinion, have merited the first instead of the second place.

There can, however, be no dispute that as a piece of purely idealistic design and pre-eminently as a specimen of draughtsmanship, the contribution of Mr. P. MAWSON is easily superior to all others submitted. The composition of the great archway building with colonnaded wings is very satisfactory, and if the choice of deep wintry snow in the rendering of the perspective is somewhat theatrical it is certainly effective.

Mr. WARGATE has grafted François Premier additions on to a mediæval gateway, and produced a well-composed group; but, as we have already intimated, his bridge is not of a piece with the gateway, and has, in fact, quite a modern feeling.

An entrance to a capital city naturally enough suggested town-planning to some of the competitors, and these have set themselves to designing grand schemes of arrangement of buildings and roads, absurdly combined with a bridge sixty feet wide and a guard-house as required by the instructions. Still, in Never-never

Land such things may be quite the proper mode, and we need not even regard as ridiculous the scheme of "Black Cat," who makes his bridge lead to the back of a circular place, and has planned rather an exit than an entrance to the city.

Mr. G. DOUGLAS ROBINSON's design is the best of the town-planning type with a grandiose collection of colonnades and piazzas. The futility of the guard-house would be supreme, but as a design essentially modern, both in treatment and in drawing, even to the slovenliness of the latter, this is well worthy of the commendation it has received.

There are few designs for the Soane which have not some merit, and of those not premiated "Horatius" has perhaps taken the most serious view of the problem set. His gateway is really defensive, and an entrance to a walled city, so that the suggestion of the guard-room and the bridge in the instructions is legitimately adopted, but *quâ* design, there is not much that is inspiring. "Harlequin" has a real entrance gateway of grandiose character and well approached, that would be eminently suitable for a capital city if the guard-house and bridge were not factors in the problem. "Journey's End" has a fine upstanding mass in his gateway that could be seen by, even if it did not cheer, the traveller for many a league before he reached his bourne, but as a design it is somewhat bald in composition, and there is a lack of harmony in the scale of the parts.

The Tite Certificate and 30*l.* attracted nineteen designs. The subject set was a design (according to the methods of PALLADIO, VIGNOLA, WREN, or CHAMBERS) for a Campo Santo on a rocky island rising out of an inland lake. The prize was awarded to Mr. GEORGE HERBERT FOGGITT, London ("F. 13"). A certificate and 10*l.* was awarded to Mr. H. BODDINGTON, junr., Manchester ("Catafalque"), and certificates to Mr. W. G. NEWTON ("Ek Thanatou Nikos") and Mr. V. O. REES ("Apex").

The competitors for the Tite Prize were even worse treated by the conditions than those for the Soane, for they not only had to design a Campo Santo, but had to conceive an island on which to put it. Despite this we have the enormous number of nineteen designs, of which many are very feeble productions and some quite weird in their eccentricity.

Mr. G. H. FOGGITT's design is about the most Italian in feeling of the designs submitted, and given an island of the form he has conceived, a lofty hill, with the inside scooped out so as to form an amphitheatre, as it were, quite appropriate and effective, quiet and sedate with its terraced loggie leading up to the domed church. Geologically the author is quite justified in his island form;

we know at least two examples of such in the Home Counties, although they are no longer islands, as once they were in the distant past.

Mr. H. BODDINGTON's island is quite different, and allows him to place a central temple at the crown of the hill with spreading wings of arcades approached by easy zigzag slopes, forming a fine *mise-en-scène* which reminds one perhaps too much of a drawing that has hung for years on the Institute walls. Mr. BODDINGTON has not seen it as often as the judges, who are perhaps a little tired of the composition.

Mr. V. O. REES has imagined his island as a fairly level plateau with an acropolis, which gives him scope for a good composition with the campo below and the church above. His detail is based on Roman Classic, with only a suspicion of modernism. Mr. W. G. NEWTON must, we think, have received his award for his clever fancy, the expressiveness of his coloured perspectives, and his smartness in justifying the use of Greek detail by a quotation from the writings of Sir WILLIAM CHAMBERS, showing that he had observed the principles of that master, the study of which is the professed object of the Tite Prize.

"Spero Meliora" has a design of considerable merit which might have carried more weight if the domed church were less obviously reminiscent of St. Paul's Cathedral. Designing in accordance with the principles of WREN does not mean copying his application of those principles. "Fiat Justitia" also has approached too nearly to the same model. Although Mr. REES has been commended for a design with Greek detail, the judges could hardly look favourably on the Neo-Grec of "Naos," the more that his detail, though good of its kind, is grafted on poor composition and idea. "Black Horse" has made a great attempt at an elaborate composition, but his design would scarcely need much modification to make an excellent casino.

The Pugin Studentship, Silver Medal and 40*l.*, drew nine competitors. The studentship goes to Mr. J. B. F. COWPER, Manchester, and a prize of 5*l.* 5*s.* to Mr. P. D. HEPPWORTH.

There are no indifferent competitors for the Pugin, and no great exception could have been taken to the award of the judges if they had given the studentship to any other than Mr. COWPER, who would seem to have won by the more thoroughly practical nature of his studies, of which there is a good variety of subject.

Mr. P. D. HEPPWORTH displays a penchant for difficult and elaborate subjects in his measured work, the west front of Rouen and the south transept of Senlis, for example. His soft pencil sketches of Flamboyant work are very clever, and he has fully grasped the capabilities of a 6 B. His colour work is also good, and one can only suppose that the judges were a little prejudiced by his readiness to lavish time and labour unstintingly on *tours de force* of measurement and draughtsmanship.

As we have intimated, all the others have done good work, and the competition is very keen. Mr. LENTON has made many sketches, but few studies. Mr. ALISON has confined himself too much to Patrington and Beverley, Mr. HILL too much to Wells; but taken altogether the candidates for the Pugin make up a good team without a tail.

The Owen Jones Studentship, certificate and 100*l.*, was awarded to Mr. A. W. BELLIS. There was one other competitor.

For the Owen Jones Studentship the two applicants are at once differentiated by the fact that Mr. BELLIS has sent some very excellent studies of English, Italian, Spanish, and French work, and Mr. OAKLEY has pinned his faith to his own designs. Hence naturally the studentship goes to the student.

For the Institute Silver Medal and ten guineas (drawings) there were five competitors. The prize was awarded to Mr. T. F. W. GRANT, London ("Ethandun").

The Measured Drawings Prize has this year, for a change, gone to a set of drawings of English mediæval

work in Edington Church, Wilts, which has been very thoroughly measured by Mr. GRANT. The drawings of St. Lawrence Jewry, Gresham Street, London, by "Nihil sine Labore" are also thorough, and show an interesting building with good detail, but the drawing is in rather too heavy a line. The other subjects measured are PALLADIO's Basilica at Vicenza, by "Oxonian"; the Senate House, Cambridge, by "Cam"; and the Entrance Vestibule to Somerset House, by "Farnese," all too well-known and hackneyed for this prize of the Institute.

The Arthur Cates Prize (a sum of 42*l.*) drew two competitors, of whom the successful one was Mr. ANDREW GRAHAM HENDERSON.

Mr. HENDERSON has won the Cates Prize by virtue of his being a better and more effective draughtsman than Mr. VEX, for this prize has now virtually resolved itself into a sketching competition, rather than, as Mr. CATES intended, an incentive to good work in "Testimonies of Study" for the Institute examinations.

The subject set for the Grissell Prize (a gold medal and 10*l.* 10*s.*) was a design for a skating rink of wood construction. The Institute Council decided, however, not to award the prize to any of the eight competitors.

The Henry Saxon Snell Prize of 60*l.* for a convalescent home to accommodate 100 working-men was not awarded. There were four competitors.

The Ashpitel Prize (open to students who passed the final examinations, 1910) was awarded to Mr. J. B. F. COWPER, of Manchester.

The Essay Medal and twenty-five guineas was awarded to Mr. HERBERT LEWIS HONEYMAN, of Glasgow, under the motto "Dulce est desipere in loco." There was one other competitor.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Royal Institute was held on Monday, the 16th inst., at Conduit Street, the President (Mr. Leonard Stokes) in the chair. A paper was read by Mr. Halsey Ricardo entitled:—

The Cardinal Medici's Pleasure-House.

In talking of the Villa Madama—as it is now called—the chief points of interest, said Mr. Ricardo, in the poor, uncompleted and now ruined thing is its ancestry. In the Mediæval ages scarcely ever can you get the names of the artificers; but in the days of the full Renaissance the case is different, for familiar names then meet one at every turn. One's chief difficulty is to determine how much one name covers another one, how much one underlies the other. And in this case of the Cardinal's pleasure-house—which bears the name of Raphael as its designer—one wants to know what are the architectural forbears of Raphael's ancestry. He was—we can see clearly—the son of Bramante, who was the son of Alberti and half-brother to Leonardo da Vinci.

Bramante and Da Vinci came together at the Court of Ludovico il Moro in Milan, and for seventeen years they lived and worked side by side. Both were employed on the great constructional works that powerful lord carried out at the castle. When the crash at Milan came in 1500, Da Vinci sought the patronage of the French king, and Bramante went to Rome. Bramante was already known at the Eternal City, where he had before been to measure the ruins of the Imperial masterpieces, and where the fruits of his study were arising in the form of the Cancelleria. He was soon after his arrival successful in a competition organised by Pope Julius II. for the erection of a new St. Peter's. Besides this work he was entrusted with the remodelling of the Vatican Palace and the laying-out of the approaches and general setting to the new basilica. The idea of architecturally treating the setting that environed a palace or a villa was a new one to Rome. The first stone of St. Peter's was laid in 1506. Julius died in 1513, and Bramante (aged 60) in the following year, leaving instructions in his will that his friend Raphael should carry on the work at St. Peter's. Raphael had been invited five years before to Rome by Bramante to see what could be done for him at the Vatican. The young artist's work there became paramount, and he caught some of the impassioned loftiness of Michael Angelo's and Bramante's ideals.

The next Pope, Leo X., was a young man of 37. Giovanni de Medici posed as a more ardent and better appreciator of

the arts than his predecessor. Immediately on his accession he elected his cousin Giulio as cardinal. Giulio quickly set about devising a country retreat on the slopes of Monte Mario, a mile or so outside the hot, dusty streets of Rome. It was to be the *ne plus ultra* of a pleasure-house both in beauty, in sumptuousness, and in the scholarly treatment of its decoration. Giulio himself was a scholar and enjoyed the society of men of letters and antiquarian research. So ancient authorities were consulted as to what constituted a patrician's country residence, Pliny's description of his country place in Tuscany proving a rich mine of information.

Raphael prepared various designs, and lived long enough to see the actual building started and the terraces beginning to shape themselves. His mind—eager to assimilate the word-pictures of the scholars poured freely into his ears—saw the possibilities of house and landscape gardening and at once began to materialise them. Raphael's studio was probably a kind of arts club, where all kinds of work and all kinds of discussion and argument were going on simultaneously. The artist had no time to brood over the significance of things, for the amount of business going on in his workshop must have been tremendous. The throng of pupils surrounding him were told to study and measure the ruins of ancient work, and especially the recently discovered examples of internal decoration. The ancient use of stucco enrichment was thus discovered. Raphael was quick to seize upon its possibilities, and under the hands of two of his pupils—Giulio Romano and Giovanni da Udine—the walls of the Villa Madama were encrusted with this filigree work.

The Villa Madama, after Raphael's death, was carried on by Antonio San Gallo the younger, as far as construction was concerned, Giulio Romano and Giovanni da Udine fashioning the decoration. The villa was never finished in its entirety. Pope Leo died at the end of 1521, after a reign of eight years. The next Pope, a severe and ascetic Fleming, spread dismay into polite Rome by his grim disapproval of every form of luxury and the arts. His tenure of the chair lasted little longer than a year, and then Cardinal Giulio found himself elected Pope, and took the name of Clement VII. The Villa Madama was now no longer, however, of the same importance. His cousin had rioted away the hoarded supplies of the Papacy. Trouble was brewing over the horizon in every direction, for it was within a few years of the fearful sack of Rome. Eventually the Villa came into the possession of Margaret of Parma, daughter of the Emperor Charles V., and it is from her that it derives its name of Villa Madama.

Raphael's studio appears to have been the well-head from which gushed forth that stream of pleasure residences that spread all over Italy and France and reached England. The discussions that raged over the Cardinal's project helped to constitute this building as a model of what a country retreat and pleasure-house should be. All round Rome princes and cardinals took to building in after years these country mansions with elaborated gardens, fountains, terraced walls, and sheltered arcades. Henry VIII.'s palace at Nonesuch, Shakespeare's reference to pleached alleys, Bacon's directions for laying out the gardens to a stately house, derive from this initiative of Cardinal Giulio's as materialised by Raphael; and behind Raphael stand Bramante and his co-worker Da Vinci—that wonderful man who was the fore-runner of an age that has not yet arrived.

The artists of the Early Renaissance wore their scholarship lightly. They played with the result of their researches among the antiquities of ancient Italy. The Italians considered themselves the children and inheritors of the Roman Empire, and to recover some of their past glory was a most natural aspiration. As a nation this was denied to them by conquest—local ambitions prevented any permanent or complete scheme of federation—but in art and in letters it was within their grasp to emulate and reproduce the achievements of the past. At first there was no idea of reproduction. The architects borrowed the forms they found on the ruined theatres, triumphal archways, baths, and basilicas as so much elegant embroidery to the buildings growing up under their hands, treating them as so much theatrical property, to be applied for the purpose of giving a classical setting to the everyday incidents of their lives.

But with the introduction of a critical examination into the past styles of arts and letters, and the new learning caused by the flood of Greek manuscripts that heralded the fall of Constantinople, artists and scholars were exhorted to follow the ideals discoverable in the relics and literature of the Golden Age of the Roman Empire. They were pressed to become students of "style"; their patrons considered themselves as the arbiters of what was right, and the standard of their measurement was the faithfulness of the artists'

reproduction of the times and attributes of that age. The Augustan Court was revived, the Pope posing as the premier consul, the cardinals and princes as so many Mæcenases, and life was again to be as it was fifteen hundred years ago. But, as past periods cannot really be brought to life again, amongst much scholarship that was intrinsic and earnest there was much also that was only ostentation. The play-acting element was strong. We find in the architecture of the palaces a tendency to become more and more dramatic, more adapted for splendid shows and crowded receptions. Ordinary folk made the discontented best of the careless street architecture so far as use was concerned; and gave up any idea of beautifying their own holdings, partly from inability to understand and enjoy the superfine scholarship of the palaces, and partly also because the standard of carved and painted enrichment was so high that such work was generally beyond their means, and as a commercial investment (owing to the ravages of time and the violence of street tumults) a bad one. Technical dexterity was greatly fostered by the connoisseur. It was a quality which (not being an artist himself) appealed to him, and of which he felt himself qualified to judge; and all the second-rate artists were ready to encourage and instruct him by devising canons, rules, &c., for his guidance. The playfulness and tenderness of Bramante's creations in Milan fade away in the restrained scholarship of the Cancelleria and are extinguished completely in the severe immensity of St. Peter's. Michael Angelo's vestibule to the Laurentian Library can scarcely be described as playful, but at any rate it is not priggish; but his completion of Bramante's walls to St. Peter's is hide-bound and priggish to a wearisome degree. In the matter of grandiosity he strove to go one better than Bramante, and we may confidently consider ourselves as vastly the losers by this attempt at gain.

SIR CHARLES HOLROYD, in proposing a vote of thanks, confessed that he had never been to the Villa Madama. The notion that the value of a garden to a residence should have first come from Raphael was an exceedingly pleasing one, and it seemed to accord with one's ideas of the man's nature. In regard to the relations between Bramante and Raphael, there seemed to be no doubt that, while Raphael used the older man, Bramante was his schoolmaster and not his father. The Roman villas of the Renaissance presumably came from the Greek villa. Roman villas had a regard for well-ordered gardens and well-arranged surroundings. Not very much was known about the villas of ancient Greece. Appreciation of vista and lay-out was exemplified at Pompeii, where four beautiful views might be obtained at the intersection of two streets. Looking down the different prospects one saw Vesuvius, a beautiful little bay with a town on its rocky shore, and the Apennines. In looking at the famous "The Last Supper" at Milan special attention should be paid to the two shields painted by Da Vinci above the picture, for though little known they are the most delightful and graceful pieces of work of their kind ever executed. "The Last Supper" was really the greatest thing done in paint, and was in itself enough to be the sole achievement of a man's life. Mr. Ricardo in his paper appeared to be blaming the patronage system which obtained in Italy at the time of the Early Renaissance. But, said Sir Charles Holroyd, was not Pope Julius II. rather the greatest of all patrons? If Leonardo da Vinci had been taken up before by him he might have done much more. Julius insisted on getting things done. A single patron such as he was better to manage than a town council or committee. It would indeed seem as if the best period for art was under tyranny. Mr. Ricardo had been hard on the Medici generally. The phrase that "Raphael had no time to brood over things" was a good one, for it had to be borne in mind that while his work was the outcome of the knowledge around him Raphael was a great executor rather than a great scholar. His studio was not perhaps exactly suggestive of the Arts Club to which it had been likened; it was more in the nature of a mixture of Morris & Co., London University, and the Office of Works. Everyone was running about studying remains and putting them into the first work he could. The villas were architecturally designed with their painted rooms and their sculpture in the gardens.

MR. PAUL WATERHOUSE remarked that whereas it was easy enough to second the vote of thanks to Mr. Halsey Ricardo for his paper, it was not easy to accompany it with the comments customary at meetings of the Royal Institute. Mr. Ricardo had taken his audience into the heart of the Renaissance. The fascination of that period seemed to lie in the fact that in it one got a double hold from antiquity, and in entering into its spirit one shared with the men of the past an enthusiasm for antiquity. The best thing therefore

one could do was to assure Mr. Ricardo that some at all, events of his audience had been carried in spirit into that period.

Mr. LEONARD STOKES put the vote of thanks, and it was passed with acclamation. Mr. Ricardo then briefly acknowledged it.

The SECRETARY next read the award of prizes and studentships, a list of which is given elsewhere. The meeting terminated by the President announcing that the next meeting would be held on January 30, when there will be the President's Address to Students, the presentation of prizes and studentships, and a criticism of the drawings by Professor C. H. Reilly, of Liverpool.

NORTH AND SOUTH MIMMS.*

CUSSANS, in his "History of Hertfordshire" mentions that in the time of the compilation of Domesday the distinction between the two parishes (that is, North and South Mimms) did not exist, but the whole was recorded by the name of Mimmine, and then belonged to Robert de Limesy, Bishop of Chester, by inheritance from his father, Rayner. The record reads as follows:—

"The Bishop of Chester holds Mimmine. In King Edward's time it was rated at eight hides and one virgate; now for eight hides. Arable is thirteen carucates. In desmesne are four hides, and there are two carucates there, and a third may be made. Seventeen villanes there, with eight bordars, have ten carucates. There are three cottagers and one bondman. Pasture for cattle—Pannage for forty hogs. The total value is and was eight pounds; in the time of King Edward twelve pounds. Three thanes, vassals of Queen Eddiva, held this land, and might sell it. This manor does not belong to the See, but belonged to Raynor, the father of Robert, the Bishop." A carcate was as much land as one team could plough in a year.

The manor passed through various hands from Robert de Bachesworthe and Matilda de Somery; in the year 1299 Richard, son of Robert de Bachesworthe, granted his fourth part of the manor to Simon de Swanland (or Swonland), a London merchant, and at the same time he became possessed

SOUTH MIMMS CHURCH.

of the other two parts, making three-fourths of the manor. The remaining fourth part was sold in the year 1391 to Sir Thomas Knolles, Knt. Simon was succeeded by Simon, John, and William successively. The last one sold them to Thomas Knolles, who was either the same who already possessed the fourth part or his son. The last of the name of Knolles who possessed this manor was Robert, to whom there is a mutilated brass in the church. In or about the year 1560 the estate was in the possession of the Coningsbys. In 1870 Lord Greville sold the manor of North Mimms and the estate known as North Mimms Park to Coningsby—Charles Sibthorp; by this purchase Mr. Sibthorp obtained possession of the estate of Coningsby, from which family, through the female line, he is descended. It is now the seat of Mrs. Burns.

* Read at a meeting of the Upper Norwood Athenæum by Mr. T. C. Thatcher.

North Mimms Place was built by Sir Ralph Coningsby about the year 1600. It stands in a park about a quarter of a mile north-west of the church, from whence it is approached by a magnificent avenue of elms. It is a long and lofty building of brick, with wings terminating in gables at each end. The mullions and transoms of the windows and the quoins and pinnacles are of white stone; these with the lofty,

DOORWAY, NORTH MIMMS CHURCH.

twisted chimneys and central lantern break the hard, long line of the principal roof. Over the porch in the centre of the building is a projecting bay reaching as high as the coping. The interior contains some good carving, notably a chimneypiece, over which is a large oak panel representing Pyramus and Thisbe, and dated 1563.

The old manor house was probably destroyed when the present one was erected. It was in the old mansion that the Princess Elizabeth slept on the night of February 14, 1553-4, when on her way from Ashridge to London to answer to her royal sister for her supposed complicity in the Wyatt rebellion. It is watered by a feeder of the river Colne.

There is another fine mansion in the Brookman's Park; this was erected in 1682 by Andrew Fountaine, and was afterwards purchased by the great Lord Somers, who died there in 1746. This was destroyed by fire in 1892 and since rebuilt. The park adjoining Brookman's on the south is Gubbins, or, more correctly, Gabions, where formerly stood the old manor house in which Sir Thomas More lived awhile with his family.

Mr. Tompkins, in his "Highways and Byways of Hertfordshire" (1902), barely mentions North Mimms except in a tone of apology. "I could wish to go on a pilgrimage to North Mimms, one of the prettiest spots in Hertfordshire, where Sir Thomas More lived awhile at the Gabions, long since demolished, and where at Brookman's the munificent Somers pored upon his pamphlets, books, and prints, tasting in the intervals of a busy life the sweets of literature's 'pale and shadowy, but enduring, pleasure.'"

Cox, in his "History of Hertfordshire," makes no mention of North Mimms, except one small paragraph at the end of his volume under the heading of Charity Schools:—"North Mimms, where there is a school for fourteen boys, who are clothed and, when fit, put out to apprentice; and twelve girls, taught to read and sew at the expense of a young gentlewoman." Who the said young gentlewoman is I have been unable to find out. In his list of towns and villages he places North Mimms in the Hundred of Caisho, whereas it is in the Hundred of Dacorum according to Cussans.

North Mimms Church and parsonage are in the park, half a mile from the village. The church, dedicated to St. Mary the Virgin, is of the Decorated period, and is considered to be unusually pure in style. A characteristic feature of Hertfordshire churches is the narrow, tapering,

leaded spires; a feature almost wholly absent is the apse. The church is built of flint with stone dressings; it consists of chancel, nave of three bays, aisles, south porch, north chapel, and a low embattled western tower with spire, containing five bells dated 1806, and repaired and rehung in 1901, when the chancel roof was also thoroughly repaired. Several brasses have been lost, probably when the church was restored in 1859, when all the brasses were removed from the floor. Beneath the window at the east end is an original Laudian table of solid oak, nearly square, thus enabling the minister to stand at the north side of the table, as directed by the rubric, and not at the end of it. On the north side of the chancel is a huge marble monument extending to the roof, erected by his sister, Lady Elizabeth Jekyll, who lived at Brookman's, to John Lord Somers, Baron of Evesham,

NORTH MIMMS CHURCH.

and Lord Chancellor in William III.'s reign (1689-1702), who died on April 20, 1716. A remarkable feature of this monument is that part of it consists of a solid marble door, which leads from the church to the vestry.

Under the westernmost window of the north aisle is a low altar-tomb, which formerly stood inside the Communion rail. On the cover is the figure of a lady 5 feet 8 inches long, her head resting on a cushion. Around her neck is a large ruff, and frills encircle her wrists. Her dress, which is low, is cut into three deep points across the breast. Beneath the dress is a stomacher of plaited linen, reaching to the ruff. The sleeves of the dress are brocaded, but the skirt is quite plain. The three shields on the south front are charged with the arms of Beresford of Bentley, County Derby. The inscription on this Elizabethan effigy is only in part decipherable.

There are in the church a mutilated brass to Sir Robert Knolles (d. 14—) and to Elizabeth his wife (d. 1458), a brass to Sir Henry Covert (d. 1488), and a fine old brass to Richard Boteler and Martha his wife (circa 1560).

On the wall close to the Communion rail is a brass 4 feet long to an ecclesiastic; this is thought to be a memorial to William Kesteven, vicar (d. 1361). The style of the work indicates a Flemish artist. He is vested in chasuble and stole, holds a chalice, and over him is a rich canopy, with, on the right side of the central figure, St. Peter, and underneath SS. John the Evangelist and Bartholomew; on the left side, SS. Paul, James the Great, and Andrew, with their respective emblems. Above is the Almighty holding the soul of the deceased, and under separate niches at the sides are two angels swinging censers. North of the chancel, separated from it by a low oak screen, is St. Catherine's Chapel, originally a chantry, founded by Simon de Swonland in the year 1328, for the daily celebration of Mass for the souls of himself, his wife, and of his ancestors.

The Communion plate includes a covered cup of silver-gilt, given by Charles de Laet in the eighteenth century; also, a curious tankard of carved amber, mounted with silver-gilt, given by will of Lady Mews in 1751, now lent to the British Museum. The registers date back to 1565; baptisms, marriages and burials to 1656.

The church is said to have been built by Sir Hugh de Magneville (Stephen's reign, 1135-54), but Mr. Tompkins, in his guide to Hertfordshire, says he thinks it more probable that Geoffrey de Magneville, then Lord of the Manor, was the real founder, as stated by Chauncy. The present structure is now almost wholly of later date.

From a gift in 1674 of 2 acres 2 roods 20 perches of land

by Martha Coningsby, widow, ten labourers in husbandry, not in receipt of parochial relief, receive 10s. 6d. each Shrove Tuesday, the distribution being made by the trustees. Sabine's Charity, bestowed in 1816 by Joseph Sabine, produces yearly 2l. 14s. 8d., of which 1l. is given to the farm labourer, not receiving parish relief, who has the largest family, and the remainder is distributed in bread, meat and potatoes among all the poor widows in the parish in Easter week. Bread to the amount of 7l. 12s. 8d. is given on Sundays throughout the year; and 6l. 8s. is distributed in the same way at the chief festivals to all labourers of good character who attend church. Besides these there are several other charities of a similar description.

South Mimms.—This place in the ancient records is written as Mims, Mymmes, Myms, and even Memmine and Mymmys, and it is called South Mimms to distinguish it from North Mimms in Hertfordshire.

The survey of Domesday makes no mention of the manor of South Mimms. Thomas de Leuknore, who died in 1302, left half a knight's fee in South Mimms, under Humphrey de Bohun, Earl of Hereford, heir of the Mandevilles. Thomas, his son, had a grant of free warren in 1313, and some time after it became vested in the Crown, and was granted in 1488, by Richard III., to his zealous supporter Richard Scrope as a recompense for his good services in suppressing treasons and rebellions and supporting his right to the Crown. The manor was then valued at 44l. per annum; the fee-farm rent to the Crown was 3l. It is stated to have been in the possession of the Salisbury family as early as 1661, when it was comprised in a settlement made by William Earl of Salisbury upon the marriage of his grandson, Lord Cranbourn, with Lady Margaret Manners.

The inquisition taken in 1349 values the manor house at 4s. yearly; 400 acres of land at 4d. an acre; 15 acres of meadow at 1s. 6d.; 15 acres of wood at 4d.; 15 acres of fresh land (that is, land not lately ploughed) at 6d.; a windmill at 13s. 4d.; profits at court, half a mark; quit rents, 6l. 19s. 6d.; copyhold rents, 1l. 6s. 8d.; 806 days' work at ½d. a day; 606 days' work in harvest at 1d. a day; tallage (tax) of homestead at the will of the lord, never more than 6d.

The principal estate in the parish is that of Wrotham Hall, lying between Bentley Heath and Kit's End. The

BRASS OF WILLIAM KESTEVEN (?), NORTH MIMMS.

mansion was built in 1754 by Isaac Ware for the ill-fated Admiral Byng, who was shot at Portsmouth in 1757 for his failure at Minorca. The name was taken from Wrotham, in Kent, where the Byngs had previously resided. The estate passed in 1847 to the first Earl of Strafford, and remains in that family.

The moat at Old Ford, on the edge of Hadley Green, marks the site of the original house of the Frowickes, or Frowyks, who afterwards dwelt at Dyrhams Park, which in

the middle of the eighteenth century belonged to the Earl of Albemarle. For over a century it has been owned by the Trotter family. The entrance-gate at Bridge Foot is said to have been originally put up in London by General Monk when Charles II. made his public entry into the City on his restoration. The Marquis of Salisbury is lord of the manor.

The Church of St. Giles, a building of flint and red brick in the Perpendicular style, consists of chancel, nave of four bays, north aisle, and a tall and massive embattled wooden tower, with angle turret containing a clock and six bells. The church was for the most part erected about 1350, restored in 1868 by the late G. E. Street, Esq. The north aisle, built in 1526, is of brick; and some interesting fragments of pre-Reformation glass remain in the windows. The rood-loft staircase remains in the south wall, and the chancel retains an Early English piscina; here also, on the north side, is a canopied altar-tomb in the Renaissance style, elaborately wrought, and bearing the initials "R. H.," though Mr. John B. Firth, in his "Guide to Middlesex," says this is nameless and dateless. Another and similar tomb, of Caen stone, also canopied, bears the recumbent effigy of a knight in armour; there is no inscription, but it is supposed to be the last of the Frowickes, who died without issue in the middle of the sixteenth century; this is in the Frowicke Chapel, separated from the chancel and north aisle by a late wooden screen. There are brasses with effigies to Thomas Frowyk, who died in 1448, Elizabeth his widow, and nineteen children, with an inscription in Latin verse; and others with inscriptions and shields of arms to Henry Frowyk and to Roger Hodsden, 1606, Joan his wife, and ten children. The Frowicke Chapel was restored in 1898. The font is Early English. The stained east window is a memorial to the Rev. P. Hammond, twenty years vicar of the parish. The "Calvary," erected in the churchyard in 1908, was carved at Oberammergau.

The register dates from the year 1558.

In 1603 there were thirty-two burials; in 1624, fifty-two; and in 1625, fifty-four. In 1665 the names of seven persons only are entered. Of those who died of the plague there is no mention, excepting in the following extraordinary note; "besides above 100 more who died of the plague the same year" (Lysons' "Environs of London, 1800").

There are five almshouses for women, built by John Howick Howkins and others, and partly endowed with 350l. yearly, derived from Wrotham Park and other sources; each inmate receives 15l. and a ton of coal yearly; the charity is managed by the Vicar and churchwardens. The Brewers' Almshouses, founded in 1686 by Alderman James Hickson, afford room for six widows, each with an allowance of 7s. per week and two tons of coal yearly, besides an additional 5s. per week from J. Pooley, Esq.; the Brewers' Company also gives in addition, underclothing and material for gowns. The old almshouses were at Kit's End; the present were erected in 1857.

I must briefly call your attention to this house in which we are now, viz. the White Hart Hotel. This house, I am informed, is close on three hundred years old; the ceilings in the upper rooms are very beautiful, and to one room there is a bar on the inside of the door, which can be fastened; and I would also ask you to note the little cupboards over the fireplace, &c., denoting, I think, that it must have been the residence of a private family.

MANCHESTER SOCIETY OF ARCHITECTS.

At a meeting of the Manchester Society of Architects on Wednesday last (the 11th inst.), Mr. Albert H. Hodge read a paper on "Architectural Sculpture" before a large attendance of members.

It was a great mistake, Mr. Hodge said, to think of architectural sculpture as a form of decoration applied only to buildings, and as secondary to the bust and the portrait statue. Each has its place in the world of utilitarian art, and must be subservient to the principles of architecture, and must have truthful construction, balance, scale of parts. Sculpture, when part of an architectural motive, should be so closely allied to its setting that to strip one piece of it is to rob the composition of a necessary "factor of scale." How were we to bring about this oneness of mind and motive? When he studied the problem, he felt that the greatest quality of a piece of sculpture was scale. It was better to err on the small side when fixing the size of figures than to make them too large. In the former case the figure only suffers, whereas in the latter the whole building is dwarfed.

The placing of sculpture on our buildings ought to be

considered when the façade is conceived in the mind, and should not have the appearance of being added. The Parthenon pediment was not an after-thought, nor the friezes an extra. To obtain a monumental feeling we should have to look up slightly to the sculpture. When used low down it should be severe or Egyptian in character.

Mr. Hodge analysed the sculptures of the Parthenon pediment, and showed how the expression was graduated from Helios rising from the sea at one side of the pediment to the birth of Athena in the centre, the action of the figures increasing as the central group was approached and decreasing towards the quiet Selene on the other side. He instanced many other Greek sculptures designed on architectural principles, a portion of the Panathenaic frieze being planned with the wave ornament as its motive, and another part with square outlines on the basis of the fret ornament. The whole motive becomes slower and steadier as it approaches the main entrance where the assembled gods are seated. We ought to realise the limitations of sculpture and architecture, and not make our sculpture represent life models. It should look as if it were cut out of stone, not built up of small pieces. Egyptian work owes its austerity to this quality. Modern French work looks as if it were clay modelling. Straightness of drawing and tonality of surface are always found in the work of a master; rough lumps of stone left to make the adjoining parts look refined are tricks unworthy of sculpture. Style in our work is simply the outcome of true form.

He wished to point out the great loss to architecture by an estrangement from sculpture. He appealed to architects to draw closer the bond. Architecture realised its highest flights when it used sculpture in the proper way. Without sculpture it might be fine, with sculpture it is supreme.

THE ARCHITECTURAL ASSOCIATION.

DISCUSSION on Mr. Statham's paper on "Architecture Considered as Plan and Section."

Mr. MAURICE B. ADAMS in opening the discussion, and proposing the vote of thanks, said he was afraid he had not very much to add to what Mr. Statham had so admirably and tersely put before the meeting. He was glad that so high and monumental a view of things had been taken. The present day seemed to be degenerating very considerably. This tendency had struck him recently on looking at the work of the Royal Academy students. It appeared as if they had not quite the same high ideals as their predecessors used to have, and which were indicated in the conception of Mr. Street for his Law Courts, and that of Mr. Burges for the same building. Two very fine drawings were made by Mr. Axel Haig of the latter architect's design. These had been apparently lost sight of, and unless an effort is made to recover them they may be lost. The present generation were floundering about and not keeping to the high ideals evident in most of the great buildings of the past. He was wondering whether the style of drawing had anything to do with it. The present-day drawing seemed to him to be getting exceedingly theatrical, and set out in a variety of colour and rococo ornamentation. That the plans are ingenious every one must admit; and that was a point on which Mr. Statham had done so well to lay emphasis upon, but it was the section that had to be kept in mind when planning a building. In the more important recent architectural competitions the successful designs came from men who realised such details as what a mezzanine floor was, and how the subordinate parts can be arranged without destroying the main scheme. This truth had been borne in upon him by a competition for a library at Hammersmith, in which he had entered. He had realised in his design only fairly well the idea that Mr. H. T. Hare carried out extremely well in his winning design, and he had to acknowledge that he had been thoroughly well beaten by Mr. Hare in the arrangement of the storage room. Mr. Norman Shaw's houses at Kensington show a section, which is extremely ingenious, and he has managed to make his staircases and the subordinate parts fall into their places in the most ingenious way. Mr. Heseltine's house is an instance of the masterly way in which the staircase is placed. The sort of lecture which had just been delivered embodied much that was useful. Of late, however, there had been many delightful papers of another sort in which a great deal of steam was easily got up. With very much of what Mr. Statham had said concerning the Houses of Parliament, he heartily sympathised. The magnificent lay-out and general contour of the building would outlive the battle which went on as to whether Pugin or Barry ought to have the credit.

Pugin most probably deserved a considerable share; but the conception of the whole was Barry's, whose other work shows the same masterful character. Pugin, however, in many of his churches, was quite alive to the necessity of a dignified plan. It was, said Mr. Adams in conclusion, a great pleasure to propose a vote of thanks to Mr. Statham, who was one of the oldest friends of the Architectural Association, and who contributed in the past papers of a practical kind.

Mr. GERALD C. HORSLEY said he had enjoyed immensely seeing the plans exhibited on the lantern screen, many of which were old friends. It was impossible to help wondering whether students, and those who were a little older than students, might not with advantage study plans more than they did at present. He remembered the time when on sketching excursions most of those taking part made a plan of almost every building visited. He himself followed that example, and found that it tended towards collecting a representative number of plans very interesting to look at afterwards, and which were an undoubted help. Such plans were not elaborate, but just sketch plans jotted down in a sketch-book while visiting the building. There was a point or two in the moral at the end of the paper on which he would like to touch. Mr. Statham had said: "I am proposing to deliver you from all this (question of 'What style shall it be in?'), once for all, by recommending you to adopt a view of architecture in which detail, in a sense, does not matter." That was quite a right proposition when one was considering a full series of plans and sections; but it must not be forgotten that plans and sections were architecture in its elements. Probably Mr. Statham meant also that in the plan and section of a building one got its real spirit, and the whole conception. That was quite correct. But Mr. Statham went on: "What I want to suggest is not, of course, that good detail is of no consequence, but that, provided it is good of its kind, it really does not matter so much what kind you adopt so long as the main conception of the building is a fine and effective one." With that view it was impossible to agree. When one is making a design, the first endeavour is to get a good plan, and then to pass on to making the drawings of the elevations and sections. The work is comparatively easy so long as the drawings, elevations, and sections are to a small scale. The difficulty of architecture nowadays begins when one comes to the details. Certainly not everything depends upon the detail. Mr. Statham's own remarks, however, on the Pantheon, showed how very important the detail is in the design of a building. He also said that the plan of the Houses of Parliament could have been expressed equally well in terms of Renaissance as in the Gothic which we know. Surely the reason for this is that the plan is a Renaissance plan, designed by Sir Charles Barry, who was trained as a Renaissance man! But no one would be pleased and satisfied if the exterior was rendered different to what it is. The Victoria Tower was a thing they would not and could not give up. Nor would they have been satisfied if the exterior of St. Paul's had been designed by another hand, or if the detail had been done by someone else than Wren.

Mr. W. J. H. LEVERTON expressed pleasure at hearing the defence as to Barry being the architect of the Houses of Parliament. Mr. Statham had shown successfully some time ago that such a plan could not have come from Pugin. With regard to Mr. Maurice B. Adams' reference to the desirability of tracing and securing for the Association the design prepared by Burges for the Law Courts, he would like to mention that the designs submitted in that competition were for many years in the hands of the South Kensington authorities. Some time ago it was proposed to destroy them. When this became known some men from the Office of Works rescued all that could be found of them, including the one by Burges.

Mr. ARTHUR KEEN, after alluding to a house by Mr. Norman Shaw in Cadogan Square as being the one he particularly admired, said he had for some time been trying to get hold, as a specimen of draughtsmanship, of something that Burges did. That architect's scheme for the decoration of St. Paul's was shown at the Association's conversation last year. As to Mr. Statham's paper, Mr. Keen said he felt some regret that he had not made it "Architecture considered as Plan, Section and Lighting," for the lighting appeared to him almost as equally an important matter as the other two. He would suggest therefore that as the paper just read had dealt chiefly with plan, Mr. Statham should at some future time give them another paper treating of Section and Lighting. Not much was heard about the bearing of construction on planning, though obviously it was important. The plan prepared by Bernini for the Louvre was

extremely interesting. His treatment of the courtyard angles might be often seen in English manor houses, where the corner is admirably filled up with a secondary projection. Longleat illustrates this characteristic. Mr. Statham's plan for dealing with the sites for the proposed Government offices was very interesting, especially as to how far the blocks of buildings as actually carried out exceed in the amount of solid the amount shown in Mr. Statham's proposal. It would seem as if some such scheme could be executed without much sacrifice of land. This would indicate how far a layout that was successful from the artistic point of view could be successful also from the economic. The paper had shown how very much everything depended upon good planning. This was also seen in the recent big competitions, in which the plan has evidently been at the back of the assessor's mind. He had, in conclusion, great pleasure in putting to the meeting the vote of thanks for the very able and capable paper.

The vote of thanks having been carried with acclamation, Mr. H. H. STATHAM replied to some of the points raised. He expressed agreement with the admiration of Mr. Norman Shaw's plans, many of which were remarkable for the degree of fancy in the way they are disposed. Pugin was a great sectional designer. In his church work he had a way of carrying his nave arcades to a considerable height, and adding a low clerestory in such a way that although from the exterior the churches seemed small, from the inside they appeared large. The greatness of the Pantheon did not depend upon its detail, for it was a great building in spite of the fact that its Order was too large. As to St. Paul's, he questioned whether much of the minor detail had been designed by Wren. It was quite possibly worked out by the carver from the architect's scribbled notes. Moreover he did not admire much of the exterior detail with the exception of the two western towers. As to the Law Courts designs he thought that every one of them should be preserved. Burges' design in particular was a wonderful conception, though not perhaps suited to London.

The PRESIDENT announced that the next meeting will be held on January 23 and will be combined with the Camera Sketch and Debate Club. A paper by Mr. Theodore Fyfe entitled "The Atelier versus the Builder's Yard" will be followed by a debate.

YORK AND YORKSHIRE ARCHITECTURAL SOCIETY.

IN a paper read before the above Society on January 11, Mr. J. Stuart Syme said Egyptian art, as might be expected from the remote position it occupied in history, was very closely dependent for its characteristics on those of the race which practised it, and on the conditions under which it lived, and no study of the one is complete without the other.

Apart from articles of domestic use, toilet appliances and the like, there is little left to us which was not connected in some way with the religious life of the people, and with their profound belief in the immortality of the soul. Had it not been for this belief we can hardly suppose that they would have been at such pains to construct and adorn with a wealth of sculpture and painted decoration the various tombs and monuments from which chiefly we obtain our knowledge of their life and art.

So far as can be judged from contemporary records, the tools employed for carving in wood or stone and the method of using them did not differ greatly from those in use at the present day. In addition to various chisels and mallets they used the bow-drill the saw and the gouge. They were very partial to the use of the adze in wood-working. The tools were of bronze and iron, and there is no evidence that they had any knowledge of steel, or had any method of tempering to an unusual degree of hardness. Wooden statues, if of great size, were framed up owing to lack of large timber. The Egyptian artists were very skilful in line drawing which was really the basis both of their decorative painting and their bas-reliefs. They had regular methods of study for beginners, arranged progressively from simple objects to finished heads, capitals, &c. The models consisted of small plaques and cubes showing the object in various stages of execution. Bas-relief proper was not so much employed for surface decoration as simple incised work, or what has been called "relieved intaglio," in which the object was outlined with deeply incised line and swelled out gradually from the bottom of the recess thus formed, and slightly modelled. The bas-reliefs were almost invariably painted, the colours being used fairly pure and on conventional rather than naturalistic lines. Statues in sandstone, limestone, or wood,

were also painted, but those in granite or other hard stone were more highly finished off and brought to a fine polish. Egyptian art did not undergo any marked development once the characteristics of the style had been fairly established, and the differences were rather in degree than in kind, except as regards minor details of costume, technique, &c.; the most vigorous work originated early during the ancient Empire, and some of the best examples date from about the fifth dynasty. From that time onward the tide of excellence ebbed and flowed, through the Middle Empire, till in the New Empire after the overthrow of the "shepherd kings," issued a Renaissance during which the quality of the work produced probably excelled that of any other period. All Egyptian art both in painting and sculpture is extremely conventional, and many of their mannerisms and methods may appear crude and unjustifiable, but they were probably dictated by considerations which under the circumstances were fit and proper. Their decorations were in fact not mere ornament, but rather histories and tales written for a purpose in a lazy age, the terms of which were clearly defined and would be understood of all, and with an aim which is worthy to rank high among the best the world has seen.

Mr. Bellamy proposed a vote of thanks, which was seconded by Mr. R. R. T. Smith, and the lecturer briefly responded.

THE SOCIETY OF ARCHITECTS.

A NEW departure, so far as the Society is concerned, was made last Thursday evening, when only formal business was taken at the ordinary meeting at 28 Bedford Square, and the remainder of the time devoted to social intercourse and music.

The object of the gathering was to give members and students an opportunity of meeting together on a more friendly and informal footing than is possible under the usual circumstances, and that the Council's experiment was fully justified was shown by the way in which the members and their friends took advantage of the invitation.

The President, Mr. Geo. E. Bond, in his genial way contrived to combine in his brief address (directed more particularly to the students) both instruction and humour, and his remarks were received with every indication of appreciation.

Round the walls of the reception-rooms and other parts of the building were exhibited measured drawings, sketches, water-colours, and photographs, the work of Col. F. S. Leslie, R.E. (Hon. Secretary), Mr. B. R. Tucker, Mr. F. M. Cashmore, Mr. Frank Hearne, Mr. H. Y. Margery, Mr. S. R. Smith, Mr. A. B. Dury, Mr. A. F. Davies, Mr. F. R. Catling, Mr. J. T. Westbye, Mr. E. J. Williams, Mr. J. D. Stewart, and Mr. H. Phayre.

Light refreshments were provided and smoking was permitted.

A feature of the evening was the very excellent programme of music arranged by Mr. R. Willock, F.R.I.B.A., to which the following artistes contributed:—Miss Hilda Campbell, Miss Dorothy Eales, Mr. Harry Jackson, and Mr. Craig, whose efforts, mostly in lighter vein, as became the occasion, were rewarded by hearty applause and encores.

During the evening the Chairman extended a welcome to the visitors, and Mr. Max Clarke, F.R.I.B.A., in responding, referred with satisfaction to the arrangements made for the deliberations of representatives of the R.I.B.A. and the Society on registration, which he hoped would result in great benefit to the profession.

It is anticipated that the success of this meeting will cause a demand for others of a similar kind, and it is hoped that at fixed intervals further opportunities may be afforded to members and their friends of meeting together under similar circumstances.

It is desired that in future the musical talents of members of the Society may be enlisted to add to the harmony of the gatherings, and the Secretary will be glad to receive the names of any who are disposed to assist in this way.

MESSRS. KAYE, PARRY & ROSS, architects, Dublin, have been placed first in the competition promoted by the Bangor Urban District Council (Ireland) for plans for the proposed hot sea-water baths at Pickie. Sixteen sets of designs were adjudicated upon by Mr. Frederick Batchelor, A.R.H.A., the assessor. The Urban Council have accepted scheme (a), which is estimated to cost 6,903/.

MR. E. SEWARD v. THE CARDIFF CITY COUNCIL.

MR. MUIR MACKENZIE, one of the High Court Official Referees, resumed on January 11 the hearing of the action brought by Mr. Edwin Seward, F.R.I.B.A., and a member of the Royal Cambrian Academy, for the recovery of fees and damages from the Corporation of Cardiff in connection with the plans, &c., he had prepared as architect in connection with the Welsh National Museum scheme at Cardiff. The evidence has already been reported in *The Architect*, and on the resumption of the proceedings after the Christmas Vacation counsel on both sides summed up the case at considerable length. On behalf of Mr. Seward, Mr. E. Pollock, K.C., in his arguments commented strongly on the Corporation not having called Mr. Wheatley, the Town Clerk, to support certain imputations which Mr. Pollock characterised as unworthy of a Corporation. Mr. Wheatley might have been able to throw light on the matter if there had been any improper action on the part of Mr. Seward as regarded the specifications.

At the conclusion of Mr. Pollock's arguments on January 12

The Official Referee reserved judgment, remarking that he would endeavour to give it as soon as possible.

ILLUSTRATIONS.

NATIONAL MUSEUM OF WALES, CARDIFF.

WE publish to-day Messrs. LOVEGROVE & PAPWORTH'S design for the above competition. The plans show the general arrangement of the galleries for the various departments, which are grouped round a central hall, the appearance of which is further enhanced by the large top-lighted galleries of the Welsh Natural History Department and the History and Antiquities Departments, which adjoined it and added to its apparent size. The main entrance was on the western front, with the ladies' and gentlemen's cloak rooms, the refreshment room and the children's museum on either side of the entrance hall; and opposite, on the eastern front, the lecture theatre, curator's offices, board room and library were grouped. The reserve collections attached to each department were planned immediately adjoining the department to which they belong, and consisted of a floor with a mezzanine over, the two together making up the height of the one storey main department. The perspective shows the general scheme of the design from the elevational standpoint. The original sketch was exhibited at the Royal Academy Exhibition, 1910.

PROPOSED HOUSE AT CHESHAM.

THE walls are intended to be in 2-inch multi-colour Buckinghamshire bricks with wide mortar joints—occasional patterns to be formed (above the head of the ground-floor windows) with dark headers. The quoins and hood of doors to be in Corsham Down Bath stone. The roofs are to be covered with hand-made brindled tiles brown in colour. The cornice is of wood painted white. The window sashes and frames are also to be painted white, but the external sun-shutters to be painted green. The drawing of this house was illustrated in the Royal Academy in 1909. The architect is Mr. STEPHEN J. B. STANTON.

TRAVELLING STUDENT'S SKETCHES.

WE give reproductions of two more of Mr. WALSH'S drawings, made during his tour as our Travelling Student last year.

MR. JAMES CHALMERS, architect, Glasgow, has prepared plans on behalf of a Glasgow syndicate for the provision of a "Garden City" at Barassie, near Troon, on the Ayrshire seaboard. The site belongs to the Duke of Portland and extends to nearly sixty acres. It is proposed to erect about 180 bungalows of medium size, which would be tenanted principally by golfers. Provision is also made for a concert pavilion, an hotel, a boarding house, a bowling green, and a tennis court. The total cost of the project is expected to be about 160,000/.

THE ILLUMINATION OF INTERIORS.

By Professor J. T. MORRIS, M.I.E.E.

PART I.

DAYLIGHT ILLUMINATION.

(Continued from last week.)

ILLUMINATION PHOTOMETER AND ITS DAYLIGHT ATTACHMENT.

TO return to the experiments previously described on indoor and outdoor illumination. The instrument used was one devised by Mr. A. P. TROTTER, made by Messrs. EVERETT, EDGCUMBE & Co., Ltd. Fig. 5 illustrates the

FIG. 5.

general arrangement. The apparatus consists of a wooden box, on the top of which is a white matt screen A. In this screen is a slot about $\frac{1}{8}$ inch wide, through which the experimenter can see the tilting screen B inside the

the screen B appears of the same brightness as A. Attached to B is a pointer moving over a graduated scale. When the position of equal illumination has been found the pointer reads on the scale direct in foot-candles the illumination of the surface A. The standard lamp is supplied by a 4-volt accumulator, and precautions are taken to insure its accuracy. For taking measurements out of doors during daylight hours a special hood (fig. 6) is placed over the instrument. This reduces the illumination to any extent desired by means of diaphragms of known aperture fixed in a tube at a distance of ten inches from the screen A.

In using the Trotter universal photometer for the measurement of external or daylight illumination the question arises, What is the ratio between the intensity of light falling on the instrument screen when the above-mentioned hood is in position and when it is removed? Imagine a hemisphere circumscribed about the slot in the screen as centre and with the height of the hood as radius, then it is evident that if the intensity of light were the same for all parts of the sky the relation would hold:—

$$\frac{\text{Intensity of light measured}}{\text{Total flux of light from hemisphere}} = \frac{\text{Area of diaphragm}}{\text{Area of hemisphere.}}$$

But as all parts of the sky are not equally effective in contributing towards the illumination of a horizontal surface, the above ratio will not give a true measure of the proportion of illumination which will fall on a horizontal surface when the hood and diaphragm are in position to that which will fall on the same surface when the hood is removed. Not only does the angle at which the light strikes the surface affect the question, but also the actual illumination received from each part of the sky from the zenith to the horizon on a surface turned so as to face directly the part to be tested, is different. Those parts nearer to the horizon contribute less than those parts which are nearer to the zenith.

With the object of determining the magnitude of these effects the author has conducted a series of experiments. The size of the diaphragm used was such that the ratio of its area to the area of the hemisphere was 0.003. Measurements were made during the evening in the failing light from the roof of the East London College alternately with and without the hood. The true reducing factor of the diaphragm came out as follows:—

Test.	Ratio.	Test.	Ratio.
1	0.016	3	0.013
2	0.018	4	0.017

FIG. 6.

box. This screen has also a matt white surface. Contained in a separate compartment is a small working standard lamp D, which, by means of a fixed mirror at C illuminates the adjustable screen B. In one position

The mean of these readings is about 0.015—i.e., five times as great as the ratio of the diaphragm area to that of the circumscribing hemisphere. The exact ratio probably varies considerably according to the state of

the day (cloudy or otherwise), and the author believes that the inventor of the instrument suggests taking the ratio of the diaphragm to hemisphere as an arbitrary but constant quantity for ordinary purposes. The author ventures to differ from this, as it appears to be rather misleading, and suggests the ratio 0.015 (instead of 0.003) as, although only approximate, a much more representative value than that given by the makers. This value was used by the author in the calculations given above. As a further check the author has tried balancing the light of an electric arc against daylight with a Bunsen photometer, and has obtained values bearing out the measurements made with the Trotter instrument when using a ratio five times as great as that given by the makers.

A number of experiments were made to ascertain the distribution of light over the sky, and the following results (Table VI.) were obtained, giving the ratio of the intensity of light in an inclined direction to that in a vertical direction. These measurements were made about one o'clock on a rather grey day in June from the roof of the East London College, and the quarter of the heaven in which the sun was was readily discernible.

TABLE VI.

Angle of Inclination from Vertical.	Direction of Inclination.			
	N.E.	N.W.	S.E.	S.W.
0°	1.00	1.00	1.00	1.00
30°	0.64	0.70	1.07	1.24
45°	0.71	0.79	0.68	0.97
60°	0.57	0.98	0.49	0.86
80°	0.175	0.175	0.18	0.16

It will be observed that the vertical intensity has been taken as unity, other figures being, of course, relative. It is interesting to note from the above figures what a small proportion of effective illumination in London, at least, comes from those parts of the sky near the horizon.

(To be continued.)

THE PAINT AND VARNISH SOCIETY. STANDARDS OF COLOURS.

A DEBATE on "The Possibility of Introducing a British Standard Colour Card for Paints and Distempers," was held at St. Bride's Institute, Ludgate Circus, E.C., on Thursday, January 12, when Mr. Arthur Seymour Jennings opened the debate as follows:—

It must be regarded as a somewhat remarkable fact that in the English language—or in any other for the matter of that—we have no exact names for colours notwithstanding the earnest efforts that have been made by scientific men for many years to that end. It must be clearly understood that I am speaking now of the appearance of colours quite regardless of their pigmentary composition. The spectrum colours are more or less named by various well-known authors on "colour," such as Chevreul, Benson, Rood, and others; but so far as paint is concerned the nomenclature is chaos. If I order a quantity of, say, canary yellow or peacock blue from a dozen different paint manufacturers, I shall be almost certain to receive colours no two of which are exactly alike in hue. Again, if I ask half a dozen practical decorators to mix me a Venetian green the results will probably differ very widely. The explanation, of course, is that ideas differ as to the colours named; and while one man thinks that canary yellow should have a slight greenish tone, another may incline rather towards a more yellowish tint. And I stop here for a moment to explain that I am using the words "tone" and "hue" as synonyms, and as indicating the particular cast of a colour, as for instance, one might speak of a particular red having a yellowish hue or tone. The word "shade" I am using to indicate any colour which has been lowered or saddened by the addition of black, and by "tint" I mean a colour which has been lightened by the addition of white.

We shall all agree, I think, that the names of colours as at present used mean practically nothing at all, because they convey no definite meaning. Perhaps an exception to this is in artists' colours, where the names in common use approach fairly closely to being identical with certain notable exceptions. We shall, I think, also agree that the very great variety of names given to the same colour, or vice versa the different hues, shades, or tints which are pro-

duced under the same name, is in commerce exceedingly inconvenient. For example, a paint manufacturer may frequently have to specially mix, perhaps, a small batch of colour, a considerable trouble to himself, to meet a particular order, while if colours of paints could be standardised, they could be supplied from stock. To architects the want also proves most inconvenient, and results in their usually specifying in some particular piece of decoration that it shall be finished in "approved tints." This means that the decorator has to spend, perhaps, hours in mixing various samples for approval, while if there was a standard the architect could select the colours which met with his approval and specify it by name or number without any further trouble. Again, a standard of colours shown by sample could be submitted to clients, and they could select the one which they liked best, and the trouble would be at an end. One might enlarge for a considerable time upon this aspect of the subject—the inconvenience of the present want of system and the great utility of standardising.

Now I may presently be told that no system of exact nomenclature can be formulated because there exists so many colours. This is obviously true when we consider that actually there is no limit to the number of colours at all. Mr. Joseph W. Lovibond estimates that there exist sixty million colour sensations, but when we consider that the spectrum is a graduation passing from one colour to the other, and this spectrum might be extended to any length, and when we consider also that any one of these colours might be mixed with any one or more of the others, we shall see that the word "infinite" is the only one to apply in this connection. But because there is this vast quantity of colours, there is no reason why we should not endeavour to name a few of those which are in common use. If we cannot do everything to the end in view we can, at least, do something.

Time will not permit me to even mention the various plans that have been recommended to solve this problem, but I think I am right in asserting that all of them are based upon those colours which occur in the solar spectrum. Prango, of Boston, for instance, endeavoured to systematise the subject in the following manner:—On the sheet at the top is a spectrum of a pure colour divided up into squares, and beneath these similar squares with similar colours to which had been added white. There are several rows with more white added until the bottom is reached, and the tints are, of course, very light ones. The second sheet is exactly the same as the first, but a small portion of black has been added to all the colours and tints; the third sheet is the same thing again with more black added; the fourth sheet more black still, and so on to the end of the work. The colours are distinguished by lines, and the lines indicate the amount of white added by numbers, so that a letter and number give any of the combinations. For practical purposes this scheme is useless, because the majority of the paints on the market do not accord in hue with hardly any of the colours given. This is a very important point to which I desire to direct your attention. Certainly a majority of the ordinary paints sold on the market are not spectrum colours at all, that is to say, they are not pure colours, but are mixtures of complex colours. I have carefully gone through the paint colour cards kindly supplied to me by paint manufacturers and others, and I find that amongst the paints there are perhaps about 5 per cent. of pure colours. In the figure of the spectrum before you, kindly prepared for me by Mr. Oliver, you will not find such colours as a Brunswick green, an amber, an ochre, or a hundred and one other colours I could name. Now it does seem to me obvious, that, however fascinating and scientific the theory of the subject may be, yet what we have to do is to deal with those pigment colours which are in common use, because those which are ordered frequently are the very ones we wish to standardise. I am aware, of course, that many manufacturers have specific names for their colours, in some cases registered, and I hope later to show how this difficulty may be overcome.

The Paint and Varnish Society has happily made great progress during recent years, and it now includes within its membership many colour experts who will, I trust, kindly criticise the proposition I am about to make. We all recognise, as I have said, the absolute need of some convenient colour nomenclature; we are, I take it, by no means decided as to what that form should take.

The suggestion I shall make, if not theoretical or scientific, is, at least, a practical one, and one which would grow in importance as time goes on. Briefly, the suggestion is this: That we invite the co-operation of a few prominent members of the Royal Institute of British Architects, of the

London Decorators' Association, and of paint and colour manufacturers to form a committee of selection. They would decide by examining the various cards of different makers, such as those before you, what names should be given to a certain number, say three, four, or five hundred to commence with, and then would agree as to what name should be given to each. A selection of colours having been thus made and named, I suggest that this Paint and Varnish Society should issue samples of each colour in oil paint and distemper, and that these samples should be issued in book form to be published at as moderate a price as possible, so as to bring it in the hands of decorators, architects, and paint users generally. The book might be termed "The British Standard of Colours for Paints and Distempers," and its sale ought to bring some considerable profit to this society and enable it to extend the good work it is doing.

This debate is termed "The possibility of introducing a British standard." I suggest that it is possible to introduce such a standard by adopting the method I have stated. I will not take up your time by entering into details, because these would be naturally settled by the committee, but I think that, at least, three tints of each colour should be named, and these could perhaps be arranged in the form of a hexagonal prism on the system adopted by a well-known German firm of dye manufacturers. The naming being done, the tints could be numbered 1, 2, 3, and 4 without difficulty.

In proposing this scheme I quite appreciate the fact that it would take some years before the classification would be universally accepted; but then I remember that the progress of this society, to which I have already alluded, is very likely indeed to continue, and if we, as a society, backed up with the National Association of Master Painters, the Royal Institute of British Architects and others, say that such a hue, tint, or shade is to be called by a certain name, I think that after a reasonable time we might expect that that name would come into general use.

What is likely to happen? Suppose the work is completed and the book is issued as I have suggested, and that it is purchased by a number of decorators, among others, they would show it to an architect or client who would make a selection for the particular colour he wanted. The order would then be given for so much paint of that particular colour, giving name and mentioning the British standard; the paint manufacturer would turn to the book and see whether he had already the exact hue required, if not, he would, of course, have to match it in the same way as is done every day. It seems to me it is absolutely certain that when the book came into general use, and paint manufacturers frequently received orders which referred to colours contained in it, they would lay in a stock of all of them, because it would save them expense in mixing small batches.

It may be urged that many painters mix their own colours and do not order them ready made, but this would not affect the matter, because if an architect or house owner selected a certain colour from the book the painter could either order it ready mixed or mix it himself, as he might desire. In the latter case he would have a sample before him upon which to work.

I anticipate that someone may raise the objection that very few colours are really permanent, so that in course of time those originally selected might change to some extent. Being in a book, however, which would the greater part of the time be closed, the colours would be protected from light, and thus rendered, at least, fairly permanent. But I suggest that samples of the standardised colours should be locked up in a place to which light is not admitted, perhaps in an hermetically sealed case, and secondly, that at the start a reading be made by the Lovibond Tintometer, so that when future specimens are to be prepared the precise colour might be re-obtained. Mr. Lovibond, who is present, and who has done such grand work in the direction of colour measurement, will be able to tell us later how far this part of my suggestion can be carried into effect.

There would, I take it, be included in the book a fair number of what I may term "Art shades," for want of a better term. In dealing with these it would probably be necessary to issue from time to time additional pages containing such colours. I realise the difficulty in dealing with those colours, the names of which are registered, and are therefore proprietary articles; but I do not think the difficulty is one that cannot be overcome. If a firm brings out a colour which they call by a special name there is, as far as I know, nothing to prevent another firm matching that colour, and selling it under another name; that is to say, it is not possible to patent a "hue," "tint," and "shade" of any colour, this being common property. As a matter

of fact we all know that this sort of thing constantly goes on. A firm brings out a special colour for some particular work, and this grows in favour until another firm brings out a similar one, and so on. In such a case the colour would be eventually included in a supplement.

I know, of course, that a large number of arguments will be advanced to what I have brought forward. I cannot anticipate them all, but I can suppose that someone will object to my plan that, because colour varies so largely with the particular light in which it is viewed, the scheme is impracticable. We all know that all colour has a different appearance when viewed in a strong light than it has, say, on a foggy day, or in a comparatively dark room. We might even go farther and say that it is highly probable that the eyes of even twenty men who are quite free from colour blindness receive precisely the same sensation of colour, but this really hardly affects the question. What they see and what they select is what they want. The impression a colour in the book makes on an architect's eyes would be the colour he wants to use. I see no reason why in standardising we may not suppose that the colour is viewed in an ordinary strong daylight. Mr. Charles Harrison has kindly offered to assist me in showing colours which are annihilated by burning sodium. He will also show by means of the lantern the effect of throwing one colour over another.

With regard to the influence which one colour has over the appearance of another in juxtaposition, this can be overcome by providing a grey mask of paper so as to isolate any particular colour. The mask might be of grey paper, using a light grey for the light colours and a dark grey for the dark colours.

I acknowledge very fully and freely that a great deal of what I have suggested has already been carried out by a well-known paint manufacturing firm. I wish that I could mention their name, and should certainly do so but for the unwritten law which exists in this society that firm names are not to be mentioned. However, I do not suppose there is a gentleman in the room who does not know the house to which I refer. Their specimens are before you among others. Their plan doubtless succeeded very well indeed, as far as they are concerned, but there is a great difference between work of this kind being accomplished by a single firm, obviously and quite properly for their own purpose, and a society like this doing so for the benefit of architects, decorators, paint manufacturers, and all other interests involved. In the one case rival firms are hardly likely to take up the standard of their competitors; on the other hand, they are very likely to do so because it will be most convenient, and pay them best.

The idea has already been carried out on a very much larger scale than I have proposed by the French Society of Chrysanthemumists, and I have here two books issued by this society which contain no less than 365 colours with four tints of each. All of these are classified on the system of Chevreul, a classification, or rather an arrangement, which we might follow in our book. These plates, I feel sure, will be of great service in accurately naming the colours of flowers and fruit. They do not, however, serve our purpose exactly, because they mostly follow the colours of the spectrum, and because they are printed in ink. What we want are actual paint and distemper samples. I have had a complete translation of the text made, and had intended to-night to read extracts from it, but I want to leave as much time as possible for discussion.

I desire to thank those manufacturers of paints, dyes, and printers' ink who have so kindly sent me the colour specimens which are now exhibited, and I trust that at the conclusion of the proceedings those present will examine them.

In conclusion I suggest that if the Paint and Varnish Society will undertake this most important work it will immensely increase its usefulness to the paint trade, it will gain kudos, and add to its funds—surely three very desirable objects to attain.

Although unusual, I shall, if you, Mr. President, will permit me, offer a formal resolution, viz., "That a committee be appointed to take measures to issue by this society a British Standard Colour Card of Paints and Distempers."

MESSRS. BRIGGS, WOLSTENHOLME & THORNE have been instructed by the Liverpool Select Vestry to prepare sketch plans of the proposed epileptic colony at Maghull. The cost is expected to be between 39,000*l.* and 45,000*l.*, at an average of 130*l.* or 150*l.* per bed respectively.

UNIVERSITY OF LONDON LECTURES
ON ARCHITECTURE.

"THE Fora and Rectangular Temples" were the subject of Mr. Banister Fletcher's lecture on January 10 at the British Museum. The Forum of the Romans corresponded to the Agora of the Greeks, and in some degree to the market-place of the continental town of to-day.

It was an open space around which were grouped the principal buildings, the temples, basilicas, senate house (curia), shops, &c.; sometimes it was surrounded by colonnades and porticos, and was a general meeting-place for the citizens. Political gatherings, commercial transactions and displays of various descriptions, amongst others gladiatorial combats, usually took place in the Forum, until the latter were removed to the amphitheatres specially built for the purpose.

The Forum Romanum, which is the oldest, lies between the Palatine and Capitoline Hills, and was always called the Forum, or the Forum Magnum even after the building of Trajan's Forum, which far surpassed it in magnificence and size. In time the old Forum became inadequate to the necessities of the people. Towards the end of the Republic more law courts, exchanges and buildings of utility were required; these were supplied by the succeeding Emperors, who built new fora which bore their names.

First among these was the Forum Julium, which was begun and partly completed by Julius Cæsar. The others were the Fora of Augustus, Vespasian, Nerva and Trajan. Besides the five imperial fora there were several smaller markets for bread, fish, swine, &c., as well as the Forum Olitorium and Boarium (the oil and cattle markets).

The Forum Romanum was the outcome of steady development, which began in the earliest times by the draining of the marshy swamp between the two hills by the Cloaca; it is an excellent example of town planning in regard to symmetry and beauty. The succeeding fora were all planned and executed within short periods, giving naturally a very different effect. The chief buildings in the Forum Romanum were as follows:—

The Temple of Vesta, the Goddess of the Hearth, whose shrine was the most sacred of all in Rome. It was a circular building on plan, having a central opening in the roof for the escape of the smoke; it resembled the circular temples of the Greek goddess Hestia, of whom Vesta was the Latin form. Here it was that the sacred fire was guarded night and day by the vestal virgins.

The other chief buildings were the Temple of Castor and Pollux, of which only three columns remain standing; the Basilica Julia; the Temple of Saturn, of which eight columns remain; the Temple of Vespasian, the Temple of Concord, the Temple of Julius, the Temple of Antoninus and Faustina (now the Church of S. Lorenzo), the Arches of Augustus and Septimius Severus, and the column of Phocas, which stands in the most prominent part of the Forum. This beautiful column was erected in 608 A.D. by Smaragdus, Exarch of Ravenna, to the memory of the tyrant Phocas, and is of the Corinthian order, with fluted shaft.

The rostrum was a raised platform, originally constructed of wood, placed on the comitium, a level area in front of the curia, from which addresses were made. The bronze beaks (or rostra) of vessels captured in war were fastened to the early wooden structure and gave the name to the succeeding tribunals. Julius Cæsar moved the site of the rostrum from the comitium and built a more permanent structure between the Arch of Severus and the Temple of Saturn commanding the whole length of the Forum; facing it Augustus built on the projecting podium of the Temple of Julius the rostrum known as the Rostrum Julia. There were several other less important platforms or tribunals round the Forum.

The Temples of Vespasian and Concord back on the Capitoline Rock, the plan of the latter being considerably affected by this fact; the cella had to be extended in its width, since it was impossible to obtain the required depth.

The Forum Julium was built by Julius Cæsar at an enormous expense owing to the site being in the political and commercial centre of Rome. In it he erected the temple to Venus Genetrix. The Temple of Mars Ultor commands the most prominent position in the Forum of Augustus, which equalled in size the Forum Romanum.

The Forum of Vespasian (Forum Pacis), which contained the Temple of Peace, of which nothing now remains, was much damaged by fire in the year 191 A.D.; it was restored in the reign of Septimius Severus, but very little is left now other than a part of the enclosing wall. There were other buildings of interest in the Forum, but Pliny describes the

Temple of Peace as being one of the four most magnificent buildings in Rome.

The Forum of Nerva was a narrow strip of ground between the Forum of Vespasian and that of Augustus. It was begun by Domitian and completed by Nerva. It contained a temple dedicated to Minerva, the cella having an apsidal termination.

The Forum of Trajan was a work of great magnificence. It covered a large area, the whole scheme being designed by the Greek architect Apollodorus, of Damascus. The buildings were not all contained in the Forum, as in other cases. It was approached by the Arch of Trajan, flanked by a dipteral peristyle which encircled the whole space and in which were two large semi-circular exedrae and shops. On the north-east the ground had to be cut into the Quirinal Hill to a great depth. There are several coins representing the Arch of Trajan, which has been destroyed. With the aid of these we can restore in imagination its appearance, its eight beautiful columns, entablature and most of its sculpture having been used for Constantine's Arch.

Facing the entrance of the Forum and occupying its entire breadth was the façade of the Basilica Ulpia; beyond this the two libraries with the column in the centre; and facing this again the Temple of Trajan, which stood in an open space surrounded by a large dipteral peribolus. This forum was used in the Middle Ages as a marble quarry for churches and palaces, and even much of its marble calcined and used for lime.

Other fora at Pompeii and remains in this country at Silchester and Corbridge, in Northumberland, were discussed.

Rectangular Temples.—The Temple of Fortuna Virilis was described as a typical Roman example. This temple is one of the best-preserved in Rome and is of early date. It is now the Church of S. Maria Egiziaca. It is a pseudo-peripteral-prostyle-tetrastyle temple of the Ionic order. The columns are attached, thus allowing as much space as possible to the cella, which was in Roman temples used as a place where valuable objects might be stored together with sculpture from Greece and other spoils.

The Roman temple was not orientated, as the Greek, but generally faced the forum. It was built on a high podium, the ends of which projected, and was approached by a flight of steps. The Temples of Mars Ultor, Concord, Castor and Pollux, Antoninus and Faustina, as well as examples at Pompeii, Nîmes and Baalbec, were all dealt with by the lecturer in detail as the examples appeared upon the screen.

SOCIETY OF ARCHITECTS *v.* KENDRICK.

IN the Chancery Division on Thursday, January 12, Mr. Justice Joyce had again before him the case of the Society of Architects *v.* Kendrick, on a motion for judgment in default of appearance.

The matter was previously before his Lordship on April 22 last, when the plaintiff Society sought to restrain the defendant, Charles Edward Kendrick, a builder of Staffordshire, from using the letters M.S.A., but although there was no appearance by the defendant, his Lordship refused an injunction and dismissed the motion.

Mr. Younger, K.C., for the Society, now said that since the matter was last before the Court something had happened which to a most material extent affected one of the principal grounds of his Lordship's decision. The statement of claim had now been properly served on Kendrick, and consequently there had been brought to his notice the allegations made against him. One of the grounds which affected his Lordship on the previous occasion was that it was quite possible this document might contain allegations which the defendant would seriously dispute. After his Lordship dismissed the previous motion the plaintiff Society gave notice of appeal, but the Registrar refused to draw up his Lordship's order because the plaintiffs had committed the irregularity of filing a notice of motion for judgment on the same day, instead of waiting the requisite ten days to see if defendant would enter an appearance. The appeal was accordingly dismissed.

Mr. Justice Joyce: If the appeal was dismissed there is an end to the case.

Mr. Neville (with Mr. Younger) said an application was made to withdraw the appeal because they could not go on without the Judge's order; but the Court of Appeal thought the best way was to dismiss the appeal.

Mr. Younger said that the defendant was then served with this fresh notice. The defendant was a person who, being a builder, professed to be an architect.

Mr. Justice Joyce: There is no harm in that. Is he carrying on business now?

Mr. Younger: We have no reason to suppose anything to the contrary.

Mr. Justice Joyce: It is not a motion asking for damages or alleging damage, but simply asking for an injunction against a man to enable you to move to commit him later on. It is a very serious matter, and I am not going to grant an injunction against a man who does not appear unless I know all the facts. I think, on reflection, I was wrong before in dismissing the motion. I should have simply made no order, leaving it to you to go on with your action if you pleased, when the facts could have been inquired into, and the Court could see what the defendant was doing, and how far the facts in the statement of claim were true.

Mr. Younger: Your Lordship's judgment has given rise to much discussion in the professional papers.

Mr. Justice Joyce: Yes, and I have been much abused in anonymous letters and otherwise.

Mr. Younger said that the offence was in connection with the erection of a very large house, and defendant's defence was that he could produce his diploma if desired. He did not think a "big" man should consider it necessary to resort to such practices.

Mr. Justice Joyce: He may be entitled to.

Mr. Younger: It is very bad taste.

Mr. Justice Joyce: I agree. It is very annoying.

Mr. Younger said it was like the Scotch case of the man who threatened to paint his house tartan, and his neighbour objected. It was very annoying and very bad taste, but in that case he could not be stopped.

Mr. Justice Joyce: I feel rather more strongly with regard to the nature of this case than I did before, and you are in a considerable mess with your procedure. Besides your appeal from me has been dismissed. Now you want me to hear the motion again on practically the same material. The defendant was entitled from what he saw in the papers to think that the case was dismissed. I am not going to grant an injunction against a man while the proceedings are in this position.

Mr. Younger: Then I ask your Lordship to dismiss the action.

Mr. Justice Joyce: No; in the exercise of my discretion I decline to make any order on this motion under the peculiar circumstances. I give you leave to appeal, and you can take what steps you like. Perhaps the Court of Appeal will help you out of the difficulty.

TOWN PLANNING IN PRACTICE.

A CONFERENCE organised by the National Housing and Town Planning Council was held in London on Saturday afternoon last, at the Alpine Club, Savile Row, W., to consider the subject of "Town Planning in Practice." The chief feature of the meeting was the reading of papers by the chairman and clerk of the Ruislip-Northwood Urban District Council, giving an account of the procedure followed by that body in regard to the preparation of a town plan for the Ruislip-Northwood area. Round the walls were hung a large number of plans submitted in the recent town-planning competition for the Ruislip Manor Estate.

Alderman W. Thompson, in opening the proceedings, said he considered the conference they were about to hold would be one of the most practical and, from the point of view of the administration of the Housing and Town Planning Act, one of the most important ever held in this country. Considerably more than half of the eighty local authorities who administered London had deputed representatives to attend the conference in order that they might see how far things had proceeded. It was fourteen months since the Act was passed and, although no local authority had yet got a town plan, a great many were looking about to see what others were doing. Experience had abundantly proved that the whole likelihood of success in the working of the Act depended upon co-operation, and the Local Government Board recognised as much as anybody that everything depended upon the Act's interpretation by the authorities concerned. If there arose the right spirit of co-operation it would be an excellent thing that so much individual interpretation was allowed. The advice of the National Housing and Town Planning Council was to go to the Local Government Board in every difficulty, for the latter were really anxious that they should be consulted. The main points to determine in preparing a scheme were, first, the area; second, the roads; third, the allocation of certain defined areas for certain definite purposes; fourth, the

provision of open spaces; fifth, the number of houses to be provided to the acre; and, sixth, the modification of by-laws in exchange for considerations which the landowners will give to the public.

Councillor Frank M. Elgood (chairman of the Town Planning Committee of the Ruislip-Northwood Urban District Council), in describing the experiences of that body, said it would have been very useful to them if they had known from the first as much about the best method of procedure as they did now. Therefore he hoped that their experience might prove helpful and encouraging to others. The Council had in the first place a very large area under their control, consisting of the parish—Ruislip—which was the third largest in Middlesex. It embraced about 6,582 acres, practically in the form of a parallelogram. At the northern end lies Northwood. At the southern end is the agricultural land.

About twenty years ago, when the first railway was brought into the parish, a start in development commenced. Another railway line was completed in 1904, and in 1906 there was a third railway—namely, the joint line of the Great Central and Great Western. When the district began to develop after the first railway appeared it did it on a more or less comprehensive but not an ideal scheme. A great blot occurred in leaving plots out which have subsequently been sold without restrictions. These have caused a great deal of trouble. Judging by their own experience the title "Housing and Town Planning Act" was, he thought, a little unfortunate; for the Act would obviously at first be applied in the majority of cases to country rather than to town areas, and might consequently be better called a Country Planning Act. The Urban District Council had at first to meet with some opposition, especially from such people as held up their hands in horror at the mere mention of a garden city. Considerable objections were also raised in the district against the idea of it becoming a town at all. It was very necessary to allay this prejudice, for, however enlightened a Town Council might be, they could not do anything unless they had the ratepayers at their backs. The invaluable Memorandum on the Housing and Town Planning Act issued by the Local Government Board was considered last year by one of the Council's committees. The first thing done was to communicate with some of the great landowners, for it was recognised that the guiding spirit of the Act was co-operation. Fortunately two or three great landowners between them controlled practically half the area, one of these being King's College, Cambridge.

The Council commenced by preparing a plan showing the principal landowners in the parish. Next they appointed a definite Town Planning Committee. The minds of this committee were at first absolutely blank on the matter, for the members did not include anyone of experience. The first thing to decide was whether they should be best advised to adopt the scheme put forward by King's College, or to prepare a scheme of their own, on to which the other could be grafted. At the beginning the most favoured idea was to do the former, and thereby to save themselves expense and trouble. But when it was seen to be absolutely necessary to incorporate other lands it was quickly decided to lay down a scheme of their own. It was agreed to eliminate two areas as being practically developed. This latter proved a difficult matter and caused a certain amount of jealousy among landowners, who were unable to understand why their own land should have been included and others left out. Then it was decided to include an area of some fifty acres outside the parish boundaries. The whole scheme dealt with was nearer 6,000 than 5,000 acres. Only six objections were raised, and those came from inconsiderable landowners.

It was not until August 8 that the Council decided to consider a formal resolution to make application for authority to prepare a town-planning scheme. The necessary conference for securing the "co-operation on the part of the local authority with the owners and other persons interested in the land proposed to be included in the scheme" was held at Northwood in November last. No expressed opposition was then raised, and the Council made a point of trying to conciliate owners and to explain their rights.

There was a general feeling that an owner might wake up and find a scheme cut and dried which would put a veto on his land and threaten a serious infringement of his liberties. But anything which might be done adversely affecting the owners of property was subject to compensation, and it was as well to tell people that, for they were sure to find it out, and the local authorities might just as well get the credit for telling them. One thing he felt strongly about was the preservation of points of beauty, good view, and spots

MODERN EUROPEAN ARCHITECTURE.

of historical and antiquarian interest. Whatever was done he hoped they would be sufficiently enlightened always to preserve anything in their districts of architectural, or antiquarian, or historic interest. They should not be in too great a hurry; they had to see how the thing worked, and if there was no immediate intention of land being made ready for development, there was no good in formulating a cut and dried detailed scheme; they should lay down some general lines, and let it be understood there was every possibility of settling a detailed scheme.

One of the Council's great difficulties had been to get the owners to define such objections as they had, for generally they merely objected to being included in the scheme at all. In some cases the Council had been able to talk the objectors over, and others would have to be brought to the Local Government Board. One important form of co-operation was that with the Board. A great deal had been heard about their regulations, but if any authority appealed to the Local Board in good time they would get a tremendous amount of help.

Mr. E. R. Abbot, clerk to the Ruislip-Northwood District Council, explained the various steps taken by his department in furthering the scheme. He made special reference to the help and advice freely given by the Local Government Board. When the regulations had been thoroughly digested it would not, he said, be found there was much in them to complain of. One of the things they had discovered was that local authorities did not know with any degree of accuracy who the landowners were. It was absolutely necessary that there should be an accurate book of reference. He thought the sooner all local authorities in the neighbourhood of London and in large towns who had undeveloped land took up schemes the better, for any district which did not do so would be left behind. Let them not be deterred by the supposed exactions of the regulations, for when they actually got to them these would be got over.

A FURTHER step forward in the work of the National Advisory Town Planning Committee will be taken by the convening of a national conference to discuss details of

practical town-planning administration on Thursday and Friday, February 23 and 24, at Liverpool.

The conference will be held in the town planning department (School of Civic Design) of the Liverpool University and the subjects to be considered at the Conference will be as follows:—

1. The actual details of the *prima facie* case to accompany an application to the Local Government Board for permission to prepare a town-planning scheme. The regulation issued by the Local Government Board on this point, received the close attention of the advisory committee at several meetings in 1910, and finally an interview took place between representatives of the committee and the comptroller of the housing and town planning department of the Local Government Board. The report of this interview will be placed before the conference, together with copies of the maps prepared by the Birmingham City Council and the Ruislip Northwood Urban District Council, and full particulars of the applications made by these local authorities to the Local Government Board for permission to prepare schemes.

The representatives attending the conference will then have before them a clear statement of the steps which must be taken in the preliminary stages of town planning procedure.

2. The extent to which a local authority should, under a town-planning scheme, relax or alter conditions relating to widths of roads and methods of road construction. This will give the conference an opportunity of considering in detail the various types of road which may be constructed under town-planning schemes, and for which the existing by-law may be suspended. The subject will be placed before the conference in a memorandum, in the preparation of which several municipal engineers and surveyors will collaborate.

3. The standards as to limitation of the number of houses per acre and the best practical methods of applying these standards in the preparation of town-planning schemes. The provision of open spaces and adequate garden space depends on the wise use of the invaluable power given under section 59 of the Housing and Town Planning Act to local

authorities, enabling them, without incurring compensation, to prescribe the average number of houses per acre in a town-planning scheme. A memorandum on this subject will be submitted to the conference, and it is hoped that valuable guidance will be given to local authorities as a result of the full discussion of this vital point.

In order that additional value may be given to the conference, a collection of town plans and suggested road schemes will be on exhibition during the conference.

The object of calling the conference is to give a stimulus to the practical administration of the Act, and it is hoped that, as in the case of the earlier conferences called by the committee, local authorities will be well represented at the conference now being convened.

ENGINEERING PLANT IN INSTITUTIONS.*

TO deal exhaustively with this subject sufficient material is available to fill a volume; but in accepting your kind invitation to read this paper the writer feels that, if he tells you nothing new, a useful purpose will be served if it results in an exchange of the experience of those whose practice as engineers-in-charge covers the engineering plant of, perhaps, every conceivable type of public institution.

The Boiler-house.—Without further introduction to our subject we may, perhaps, assume that in the majority of institutions steam is generated principally for the distribution of heat, for warming buildings, heating water, and for cooking and laundry purposes, and only to a minor, and usually incidental, degree for power.

While it would be invidious, and not altogether desirable, to make comparisons between any specific makes of boilers, it may be broadly asserted that boilers of large capacity for steam storage and steady steaming qualities are best suited to institution requirements. The type of boiler to which this description may be best applied is the Lancashire, and its offshoots and improvements; and although it is contended by some that this type cannot compare for thermal efficiency with some of the tubular varieties, for steady work they are very difficult to surpass.

For the virtues of the water-tube boiler as a rapid steam generator there is much to be said, on account of its construction, which lends itself readily to the promotion of a good circulation of the water, and on this account water-tubes are extensively employed in some boilers of the Lancashire and kindred types; but the quality of steady steaming is more desirable for institution work than ability to cope with a sudden demand, for which the water-tube boiler is particularly suitable.

The care of boilers is a subject in itself, and on the amount of care bestowed upon a boiler depends, to a very great extent, the length of its life. The greatest danger which a boiler runs, in the course of its career, is the interposition of a non-conducting substance between the boiler-plate and the water. This substance may be a chemical substance held in suspension or solution in the feed water, and deposited in the boiler by evaporation—or it may be grease. To allow the latter substance to get into the boiler is unpardonable; being quite foreign to water, ordinary care can prevent its entrance. This usually occurs through a too zealous endeavour to utilise all the heat in exhaust steam. The day is now past when, as formerly, this product is wasted, and exhaust steam is condensed to recover its heat for generating hot water and for heating. Before being applied to this purpose some attempt is made to rid it of the grease which it picks up from the cylinder lubricant, by passing it through a grease separator, of which we shall have a word to add presently. Although makers variously claim that their particular appliance extracts from 80 to 90 per cent. of the grease from the steam, no maker is bold enough to claim an extraction of 100 per cent. Of the proportion remaining part, at least, becomes emulsified in the condensed water, and it is almost impossible to filter it from the condensed water. The only really successful way to remove it known to the writer is by saponifying the grease with an alkali, when the particles adhere together, and are easily filtered out. Plants of this nature are usually only made for dealing with large quantities of greasy condense water, and small quantities are then far better wasted than returned to the boiler for the sake of its remaining heat. When grease is deposited on the inner surfaces of the plates it is very liable to cause local overheating and damage to the boiler.

The other foreign substance referred to is rather more troublesome. It has been asserted that a coating of scale

$\frac{1}{8}$ inch thick reduces the efficiency of heating surface 15 per cent., and many methods are adopted for either preventing its entrance, reducing its quantity, or facilitating its removal. Feed water carries these impurities in proportion to its temperature. When heated some of the scale-forming salts are given up, and if this heating of the feed water is accomplished by exhaust steam a double economy is effected. Among other methods employed may be mentioned the addition of chemical substances to the feed water to alter the character of the scale, making it soft and easy of removal; and chemically softening water before use by treating it with reagents, which chemically combine with, and precipitate, the substances contained in the feed water. This latter method is not without its disadvantages, as the softened water frequently exercises a destructive effect upon the boiler-plates.

One of the most original of the precautions against the ill-effects of scale is a substance—which is itself a good conductor of heat, and to which scale will not adhere—painted on the inner surface of the boiler-plate. In a boiler treated with this preparation the scale is often found to crack off by itself and fall to the bottom of the boiler, and that which still adheres is easily removed. The efficiency of a boiler depends upon its ability to transfer to the water as much as possible of the heat contained in the fuel. If the whole of the heat contained in a good quality steam coal could be utilised 5.7 horse-power hours could be obtained from a single pound. The nearest we have to this in practice is 1.25 horse-power hours with a suction-gas apparatus, or 22 per cent. thermal efficiency. The chief losses in a steam plant are occasioned by (a) the gases resulting from combustion passing to the chimney at too high a temperature, (b) the leakage of cold air through faulty boiler settings and flues, (c) an insufficiency of air for complete combustion, and (d) the wastage of exhaust steam and condense water.

The first cause is often the result of boilers being too small for the duty required of them. The temperature of the gases—for economy—leaving a steam boiler should not exceed 400° Fahr., and for the purpose of checking this a useful item in the boiler-room equipment is a pyrometer. Pyrometers are of various types, the operating principles of the best-known being, variously, the heating of water by cooling a known weight of metal of given specific heat, the expansion of gases, and by the difference in electrical resistance of metals at different temperatures. A rough-and-ready means of determining the temperature is by inserting in the flue strips of metal of different melting-points. Thus, tin melts at 442° Fahr., lead at 617° Fahr., zinc at 780° Fahr., and aluminium at 1,175° Fahr., and by hanging strips of each of these metals in the flue the approximate temperature may be determined.

In the interests of fuel economy it is good policy to employ boilers of ample capacity. Since the transmission of heat through boiler-plates is proportional to the difference of temperature on each side of the plate, it will follow that to increase the output of steam from a given area of surface it will be necessary to increase the temperature and rate of combustion; or, in homely language, to force the fires. This must of necessity increase the temperature of the gases passing to atmosphere and reduce the thermal efficiency of the boiler.

To utilise the heat of these waste gases an apparatus which is employed in boiler plants where the flue temperature is high is an economiser. This is a tubular feed heater, having for its object the heating of the feed water by flue gases.

The construction of an economiser is, in most cases, of 4-inch diameter tubes, expanded into special headers, fitted with access lids over each tube for cleaning. A mechanical scraping gear is worked by chains to keep the outside of the tubes free from carbon deposit, which is a very effective non-conductor of heat. Each tube has a capacity of approximately 1 cubic foot of water, and the size of the economiser is based upon the principle of the entire economiser being pumped through once per hour.

An important point in the use of economisers is to prevent the feed water entering too cold. The result of this is to cause condensation to form on the tubes, to which particles of dust and carbon adhere, resulting in a great loss of efficiency, besides being very troublesome to remove. When feed water is in use at a lower temperature than 90° it is usual to make a small connection from the delivery pipe, after leaving the economiser, to the feed-pump suction, to slightly warm the water. Very little advantage is obtained by the use of an economiser where the flue gases pass to the chimney at less than 350°, but at higher temperatures considerable economy results—often as high as 20 per cent.

Low temperature chimney gases affect the draught of boilers. The combustion of a pound of coal requires approxi-

* A paper read before the Association of Engineers-in-Charge on January 11 by Alfred E. Wheeler (Prize Medallist, R.San.I.).

mately 15 to 20 lbs. of air (200 to 260 cubic feet). To supply this air is one of the functions of the chimney, and the flow in the chimney is proportional to the height and temperature. The flues of a boiler are often of great length, which involves much friction, and it will be readily seen that the air supply must suffer if the temperature falls too low.

One of the direct results of shortage of air supply is that part of the fuel gases are distilled by heat and pass to the chimney as carbon-monoxide, unconsumed and wasted.

The steam fittings of boilers merit some passing notice. Seeing their importance, they should be of a substantial build, and only those least liable to possibility of failure should be employed. A not uncommon fault is for the main steam valve to be too small, while, in order to prevent priming, it is wise to err on the other side.

Perforated anti-priming pipes are always fixed inside the boiler, but to reduce the initial velocity of steam leaving the boiler is a still better safeguard.

Isolating valves on the main steam outlet and blow-out connection are now seldom omitted, and since nothing should be left undone to secure the safety of those whose business it is to enter boilers while others in the range are at work, locking pattern blow-out cocks should be employed, from which the operating key cannot be removed while the cock is open.

Distributing perforated feed pipes in the boiler from the check-feed valve prevents local strains in the boiler-plates by injecting large quantities of low temperature water. Even with this precaution it is not at all uncommon for the joints of a boiler to leak through feeding with low temperature feed water. This is a further advantage in the practice of feed heating.

Feed Heating.—We have already dealt with one method of feed heating in our remarks on economisers.

Apart from the undoubted advantages which the practice affords in the matter of fuel economy it has other indirect advantages which cannot be overlooked. For a long time a fierce controversy raged around the question whether feed heating by live steam resulted in economy of fuel, and although it was impossible to reason out, except by indirect means, in spite of the obvious anomaly, it was believed in by people whose opinions were entitled to respect. This belief was finally disposed of by Prof. Nicholson, in a paper read before the Institution of Mechanical Engineers.

There are two types of feed heaters, viz., the open type and the tubular type. In the first type exhaust steam is admitted after first being passed through a grease separator, and is condensed on perforated plates inside the heater, over which trickles the returning condense (or cold) water, which falls heated to a hot well in the bottom of the heater, to which is connected the suction of the feed pump. A float worked by the water level of the hot well controls the admission of the water, so that the condensing plates cannot flood. This is quite the best system of feed heating where a grease filtration plant is in use, as no back pressure is put upon feed pumps or engines, and a very large proportion of the original scale is dropped here instead of the boiler, and is easily removed.

(To be continued.)

Petrol Air-Gas.

SIR,—Having noticed that Professor Smith in his lecture states that "air will retain three times more hexane (C_6H_{14}) at 60° Fahr. than at 32° Fahr.," I desire to express my opinion of the thorough unreliability of thermostats used in conjunction with petrol air-gas generating plants.

The average outdoor temperature of the atmosphere of the British Isles is 50° to 55° Fahr. Temperatures may be as low as 5° Fahr. or as high as 90° Fahr. in the shade.

Of what use would be a thermostat when the temperature of everything outside would be 5° or 90° Fahr.?

With sudden and so frequent changes of temperature as we are accustomed to, the only reasonable method to secure a perfectly uniform quality of gas under varying temperatures is to set the regulator of the petrol feed daily on starting. The temperature of generating plant cannot alter in one day sufficiently to be noticeable on the lights.

Professor Redwood's research work is quoted to the effect that 100 volumes of air at 50° Fahr. will retain 17.5 per cent. of gasoline vapour of 0.65 density.

Therefore, if we dilute this rich mixture the air will more easily retain the proportion of spirit vapour to air; at 17.5 per cent. to 100 volumes this equals 580 cubic feet of gas of 17.5 per cent. quality to the gallon.

If another 100 volumes of air be added the vapour and air would be one of 8.75 per cent., when 1,160 cubic feet would be obtained of this quality.

By adding still another 100 volumes of air a 4.37 per cent. mixture is obtained, while producing 1,740 cubic feet of gas to the gallon.

The writer has seen a test made with .715 spirit which at 60° Fahr. gave a volume of 190 cubic feet of the vapour to one gallon.

A production of 1,900 cubic feet of petrol air-gas to the gallon would thus produce a 10 per cent. mixture.

Being personally interested in the manufacture of petrol air-gas producing plants I am anxious to have an explanation of the results mentioned on page 361, viz.: "Shell spirit of .720 to .725 specific gravity, with a production of 1,840 cubic feet of gas per gallon, is said to give a 1½ per cent. petrol vapour to 98½ per cent. of air." Is this correct?

In your issue of January 6 (p. 21) it is there stated that a 1½ per cent. to 2 per cent. mixture is a dangerously explosive one. How does the 1½ per cent. to 2 per cent. mixture come in when one gallon of petrol vaporised to mix with added air only produces 1,840 cubic feet? And is it explosive?

I have to enter my protest at the lecturer's expressed opinion of the construction of the "Centenary" patent turbine gas generator (page 330). He says of it: "Revolving in D is an arrangement which will be recognised as a kind of reversed wet gas meter."

The diagram really shows a nine-chambered turbine. Each of the nine compartments after generation and compression delivers its unit of gas into the central mixing chamber, where all units meet and mix before passing off to the gasholder.

The petrol spirit on the surface of the water prevents the entering air coming into contact with the water, and the body of water in the generator maintains a practically uniform temperature, modifying the fluctuations of outside temperatures.—I am, &c.

WILLIAM KEY.

109 Hope Street, Glasgow: January 16, 1911.

SIR,—Your correspondent Mr. R. W. A. Brewer, A.M.I.C.E., raises a point in connection with the dangers attendant on the use of petrol air-gas to go into the details of which would necessitate an extremely lengthy reply. This I shall avoid by saying at once that, on the whole, I am in fairly complete agreement with the views expressed by your correspondent. The position taken by myself throughout all the articles on the subject was that under *reasonable* conditions the question of safety was, relatively speaking, unimportant, since in no case did the danger really exceed that of coal-gas (quite a negligible quantity). It is quite true that "if a quantity (of 1½ or 2 per cent. mixture air-gas) is ignited in a closed container" it will cause an explosion (it is not strictly accurate that it will blow a small gasholder "to bits," because, as a matter of fact, the gasholder will simply be blown vertically upwards; possibly it will be crushed itself, but otherwise do little damage). The whole point hinges about the gas becoming *ignited*. I am aware that this may be comparatively easy on a laboratory bench, but it can only take place in practice under conditions which would render any gas-making plant dangerous—i.e. a general fire in the generator house. There is, of course, the objection that the gas may fire back along the pipes. This happens under exceptional conditions in a well-designed apparatus, because if the gauze is left off the burners the gas cannot be ignited, and if it is left on the burners the flame cannot travel back even if the machine is working. Firing back along the pipes can only take place if, immediately after the machine stops generating gas, persistent attempts are made to make the weak gas fire back by removing the gauze and applying a light; even then such attempts would in nine cases out of ten fail to work. Those who argue in favour of a 5 per cent. mixture must not forget that, should the supply of petrol give out, all the dangerous conditions which they consider exist with weak mixtures appear in their own machine without any special precautions to prevent firing back.

The writer "holds no brief" for weak mixture air-gas plants, and, as a matter of fact, is, equally with Mr. Brewer, inclined to favour a richer mixture, although chiefly for other reason than the question of safety.—I am, &c.,

C. A. M. SMITH.

A black and white architectural sketch of a large, classical-style building. The building features a long facade with numerous windows, some of which are grouped in sets of three. A prominent balcony with a decorative railing runs along the top of the main facade. The building is rendered in a sketchy, artistic style with visible lines and shading. In the foreground, there is a low wall or fence, and a few small figures of people are visible, providing a sense of scale. The background shows some trees and distant buildings, suggesting an urban setting. The overall tone is artistic and conceptual.

FORTHCOMING EVENTS.

<i>Monday, January 30.</i>
Royal Institute of British Architects: President's Address to Students; presentation of Prizes and Studentships; and criticism of the drawings by Professor C. H. Reilly.
Royal Academy: Lectures on Sculpture by Professor W. R. Colton, A.R.A. (1) "The Sculptor."
<i>Tuesday, January 31.</i>
Illuminating Engineering Society: Resumed discussion of "Library Lighting."
<i>Wednesday, February 1.</i>
Royal Archaeological Institute: Mr. J. W. Willis Bond on "Ancient Bridges and their Impending Destruction."
Carpenters' Company: Mr. Henry Tanner, junr., on "The Art of the Woodworker."
<i>Thursday, February 2.</i>
Royal Academy: Lectures on Sculpture by Professor W. R. Colton, A.R.A. (2) "Education and Art."
<i>Friday, February 3.</i>
The Leicester and Leicestershire Society of Architects: Mr. Ald. A. E. Sawday on "The Town Estate."

WOOD CARVINGS IN ENGLISH CHURCHES.

OF all the components that went to make up the complete English mediæval church as a beautiful organism there is hardly one that is of higher interest than the woodwork, and particularly the carved woodwork, which, indeed, on most occasions comprehends all the visible timber, for scarce a feature was there in this material that was not adorned with carving.

Although time has brought decay, fire, iconoclasm, and "beautifying" or "restoration" as agents in the destruction of much that formerly existed, our English churches still contain an enormous wealth of wood carving that has perhaps had no small share in causing the many students of mediæval art to leave to Mr. FRANCIS BOND and those associated with him in the series of Church Art Handbooks now in course of publication by the Oxford University Press the task of systematically describing and classifying the examples that remain. Of the four volumes in the series to which we have referred that deal with the subject of wood carvings in English churches, the two by Mr. FRANCIS BOND* on "Misericords" and on "Stallwork, Thrones, and Chairs" respectively have now been published.

Modern developments in photography and the great increase in recent years of skill in the use of the camera by amateur photographers have alone rendered possible the preparation of such fully and beautifully illustrated books on special topics of mediæval art as those with which Mr. FRANCIS BOND has dealt in these two volumes. It needs lovers of mediæval art to give attention to the minutiae of detail, and, however much more valuable it may be to the individual student to make drawings rather than photographs, to the historian and critic of art the superior rapidity of the camera over the pencil, to say nothing of the greater accuracy of representation, makes possible the collection of a sufficiency of examples to illustrate his story.

In the volume on "Misericords," or as they are more popularly called, misereres, Mr. FRANCIS BOND has taken the opportunity of pointing out how, from their carvings, we may learn more of the every-day life of the common people of mediæval England than from almost any other source. Here we have depicted the daily life of the villages and of the villagers' homes, the methods of agri-

culture and of trades, the sports and pastimes, the costumes, the tools, and the household implements.

We have illustrated in the carvings of "Misericords" the beliefs of the Middle Ages in the tales and fables of Eastern and of Classical mythology and the ideas prevalent of the form and habits of birds, beasts, and fishes, both native and exotic, as well as of the moral lessons and analogies founded upon those ideas. Of these Mr. BOND treats at considerable length in an epitome of the Physiologus or Bestiary, without some knowledge of which it is impossible to understand the allusions and the lessons intended to be conveyed by the mediæval artists in the times when a pictorial or sculptured story was more generally and readily understood than the written or printed word. The wonderful zoological information of the Physiologus was supplemented and supported by the tales of travellers in the days when there was no Royal Geographical Society and the globe-trotter had not yet been evolved.

Mediæval romances, Æsop's fables, legends of saints, as well as scenes from both Old Testament and New Testament histories furnished the mediæval carver with subjects for incorporating by his craft what was really the popular literature of the day, besides jokes, somewhat coarse and cheap perhaps, and often chestnuts, that passed for wit when subtlety was non-essential.

Satire was freely employed, and its shafts were aimed at the amusements as well as the delinquencies of the gentry, jousting, music, and dancing; but Mr. BOND combats the often expressed idea that religion was satirised, and explains the meaning of foxes preaching in monastic habits and such like skits as being directed against the preaching of the mendicant friars by the secular clergy or parish priests, and the canons of the regular monastic orders who upheld the value of worship rather than sermons as the truest and highest expression of religion.

All these varied phases of mediæval life are discussed by Mr. BOND, whose volume on "Misericords" is highly valuable as an exposition of the life and thought of England in the Middle Ages, even more than as a revelation of Gothic art. The art of the carver of "Misericords" is often indeed of a lower order than the human or literary interest of the story he has to tell.

We come to quite a different type of craftsman when we follow Mr. BOND in the subject of his second volume, "Stalls and Tabernacle Work, Thrones and Chairs," the seats of the choristers and the dignitaries of the Church. On these were lavished the richest designs and the most exquisite workmanship of which the mediæval craftsmen in wood were capable, and Mr. BOND gives some figures

* Wood Carvings in English Churches. I. Misericords. By Francis Bond, M.A., Oxon., F.G.S., Hon. A.R.I.B.A., &c. (Henry Frowde, Oxford University Press. 7s. 6d. net.)

Wood Carvings in English Churches. II. Stalls and Tabernacle Work, Bishops' Thrones, and Chancel Chairs. By Francis Bond, M.A., Oxon., F.G.S., Hon. A.R.I.B.A., &c. (Henry Frowde, Oxford University Press. 6s. net.)

from the records of the cost of the stalls at Wells, which were destroyed in 1848, showing that the actual expenditure there amounted to 18,000*l.*, at the present-day value of money.

The author discusses the reasons that led to the placing of stalls in churches, their position, number, and arrangement, and then describes the treatment of canopied stalls, tracing their development somewhat in historical sequence after glancing at the few remains that exist of examples earlier than the fourteenth century. Of the early work of this century Mr. BOND characterises as the earliest, and perhaps the most beautiful, the stallwork in Winchester Cathedral, to which he assigns the approximate date of 1305 A.D. The stalls at Chichester he places at 1335, and then we come to Ely with a recorded date of commencement in 1338. Next there is the work at Gloucester about 1350. Then comes a group of stalls which it is not easy to date, but all of which are redolent of fourteenth-century inspiration; those of Lancaster Church, those of the Cathedral and All Saints' Church at Hereford, and those of Abergavenny Priory and Norwich Cathedral. Of these, Mr. BOND extols the Lancaster stalls as the *chef d'œuvre* of English woodwork, and after discussion he places their date as anterior to the Black Death in 1349-50. Their flamboyant character is remarkable, but Mr. BOND combats any idea that this is due to foreign craftsmen, and regards it as the natural development of the design of the first half of the fourteenth century, parallel with the latest Gothic work of France, Spain, and Flanders.

Stallwork with tabernacled canopies was a new form that came into vogue in the latter years of the fourteenth century, and here we find the most wonderful triumphs, in richness and elaboration at any rate, of English woodwork. Many of the glorious examples of this work are described and illustrated, and the author includes as specimens of English churches Dunblane and King's College, Aberdeen.

Renaissance stallwork occupies a chapter, and then we descend to the instances of stalls in parish churches, these being rarely found with canopies. The author discusses at considerable length the use of these stalls and the presence in the chancel of the laity.

Bishops' thrones and chairs in churches, particularly in chancels, necessitate a reference to stone examples as well as wood, some of which latter Mr. BOND assigns, and we think rightly, to a domestic origin, from which they have been elevated to a higher position by donation. This in particular applies to post-Reformation periods.

Thus the author brings to a conclusion a most delightful and valuable account of the marvellous fertility of design, the exquisite craftsmanship, and the pious generosity of mediæval England as exemplified in the woodwork of her churches.

NOTES AND COMMENTS.

IN the case of *BROWETT v. The Summerhill Colliery Co., Ltd.*, and others tried before Mr. Justice LAWRENCE in the King's Bench an interesting point arose with regard to the distance from a mine at which damage was possible to buildings. The plaintiff was the Rev. ARTHUR E. BROWETT, vicar of St. John's, Princes End, Tipton, and he sued the defendant company and its directors in respect of damage done to certain buildings and the letting down of the church, which it was alleged was due to the work of the colliery. Plaintiff sued as vicar and in possession of the fabric of the church of St. John and the land upon which it was built and the churchyard, vicarage, and schools. Plaintiff's allegation was that the shafts of the colliery on the north side of the church were now only at a distance of 50 yards, and in consequence of their working the church buildings had, and were still, subsiding. Counsel for the defence pointed out that in this case the workings of the colliery were 50 yards from the church, and upon the decided cases he argued that the company's workings were outside the zone of danger, and therefore the plaintiff had no right against them at all.

The Courts had held that a colliery was free to work as much as it liked outside a 50-yards zone. Counsel for the plaintiff asked his Lordship to say that 70 yards and not 50 yards was a safe working distance. His Lordship, in giving judgment, said the schools had been damaged and were now closed. The damage to the buildings commenced in October 1907 and continued till a recent date as consequent upon the operations of the colliery company. The colliery company were working two seams, some forty and eighty yards below the surface. His Lordship had no doubt the damage was caused by the operations of the defendant company. Defendants had failed to prove that the coal under the plaintiff's property had ever been worked. Taking into consideration the whole of the evidence, his Lordship thought that the colliery company were liable for the damage sustained by the plaintiff. That damage he assessed at 525*l.*, and he gave judgment for the plaintiff against the defendant company for 525*l.* and costs. He refused to grant an injunction.

THE idea that there is any definite distance, whether fifty yards or seventy yards, at which a deep excavation, be it for a mine or a tube railway, may safely be made without endangering the stability of neighbouring buildings is quite fallacious to those who have had any considerable experience. Even the empirical rule that an excavation will not affect the surface at a greater distance than its own depth is not in accordance with facts. We have no doubt from what we know of such matters that Mr. Justice LAWRENCE was quite right in his finding that the damage to the buildings in this case was caused by the mining operations.

WHEN the competition for Hull municipal buildings was in progress one point competitors had to decide for themselves was whether the present Town Hall should be retained or rebuilt. Messrs. RUSSELL & COOPER, whose design was selected, elected to rebuild, and those who chose the other course had apparently committed an initial error of judgment that put them at once out of court. Now there is strong opposition on the Hull Corporation Property Committee to the completion of Messrs. RUSSELL & COOPER's original scheme. This is the sort of thing that imports the gambling element into competitions.

IN *The Art Journal* for this month there is more than usual of architectural interest in the shape of illustrated articles on the "New Decorations in Bridgewater House" and on "Tewkesbury." The former deals with the decorative scheme carried out by Mr. ALEXANDER JAMIESON for the Earl of ELLESMERE. The work is so well illustrated that we may leave criticism to the readers. Tewkesbury is depicted by D. Y. CAMERON, A.R.S.A., and A. R. QUINTON.

DONCASTER is anticipating a speedy considerable increase of its population from the extension of its coal-mining industry, and with this in view an important and influential Congress has been held, with the Archbishop of York as the chief speaker, to urge the adoption of a scheme under the Housing and Town Planning Act to provide healthy and pleasant homes for the additional 200,000 people whom the Archbishop anticipated would, within the next five years, come to live in the neighbourhood of Doncaster.

The Connoisseur has an interesting article on the mediæval keys in Salisbury Museum, which, archaeologically, are of considerable value, as the dates can be fairly well fixed.

IN a letter to *The Guardian* a correspondent, over the signature "F. S. A.," utters some weighty truths on the subject of brass-rubbing, which we hope will be borne in mind by architectural students, who should never let their zeal for study lead them to damage the work of the past. We agree with the writer when he says, "Rubbing

WAKEMAN'S HOUSE
RIPON · YORKS.

From a Drawing by "SANS PEUR."

"THE ARCHITECT" STUDENTS' SKETCHING AND
MEASURING CLUB.

The Wakenham's House, Ripon, is a very pleasing bit of domestic architecture, and was for many years the residence of Hugh Ripley, the last wakenham, i.e. watchman, of Ripon.

brasses does them no good, and rubbing them with untrained or unskilful hands may easily do them a great deal of harm, so much so that the guardians of many of the best brasses in England either refuse permission to rub them altogether; or restrict their permission. Furthermore, no one has any business to rub a brass at all without obtaining the permission of the guardian of the building in which the brass is fixed. Worst of all, experience shows that a considerable number of brass-rubbers use means that are most injurious for the purpose of attaching the paper to the stone or wall to which the brass is fixed. A book on English Church brasses, published this year, contains a most mischievous passage on the dodges which may be used for keeping the paper on a wall; drawing-pins, which are only condemned because they seldom find a hold, and a variety of adhesive materials, all of which would leave a stain, and many of which would damage the stone on which the brass lies. No one ought to be allowed to rub a brass who has not learned how to keep the paper steady on the surface without artificial aid; there are plenty of smooth horizontal and vertical surfaces available for practice."

THE Scottish Ecclesiological Society has recently held meetings of both its Edinburgh branch and its Glasgow branch to consider the draft of a petition to the Government on the present condition of the Chapel Royal at Stirling Castle. The petition set forth that the Chapel

was in a peculiar sense the Chapel Royal of Scotland, and dealt with its historical interest, pointing out that it was the site of a long series of previous buildings—the Chapels of St. Michael—and that it was rebuilt on a larger scale by King JAMES VI. in 1594; that though of no great artistic merit, the Chapel was a building of very considerable architectural interest as a specimen almost, if not quite, unique of Scottish ecclesiastical architecture in the period between the Reformation of 1560 and the acceptance of Episcopacy in 1610, and that if suitably repaired and decorated it would present an interior sufficiently spacious and noble to do no discredit either to the rank which the Chapel Royal should hold among Scottish sanctuaries or to the religion and patriotism of Scotland; that at present its condition was disgraceful; that it was desecrated to uses not merely secular but contemptuous, being employed partly as a store and partly as a resting-place and refreshment room for visitors; that this misuse of the Chapel was grossly irreverent and deeply pained the religious feelings of the petitioners and doubtless of many pious Scotsmen besides them; that its whole condition could not fail to convey to the numerous strangers from other countries a bad and unjust impression of Scottish reverence for the House of God and for the monuments of her history; and most from the point of view of the place this building held in the history of Scottish architecture it was worthy of better treatment. The petition asks that some order may be taken for bringing its secular employment to an end, for the removal of the floor and partitions with which it is disfigured, and for some seemly redecoration, and the putting of it into such condition that Divine service may again be celebrated within its walls, and, if possible, that it may be regularly used for worship. It is reason for congratulation to know that nowadays the British public takes an interest in the relics of the past, and that the appointment of Royal Commissions on Ancient Monuments reflects the national thought.

PETROL AIR-GAS.

THEORY AND PRACTICE OF THE NEW ILLUMINANT.

By PROFESSOR C. A. M. SMITH, M.Sc.

APPENDIX: FURTHER NOTES ON CHOICE OF PLANT.*

All Rights Reserved.

SINCE the previous articles on this subject were written, several correspondents have sent details of various plants; many of these are manufactured in provincial centres, and it was not possible to inspect and test the numerous apparatus on the market. Since some misapprehension seems to exist, it may be advisable to say that in May 1910 all of the firms connected with the manufacture of petrol air-gas known to the writer—in many cases these firms were discovered after a great deal of trouble—were communicated with, and many of them gave every facility for inspection. Certain types were selected for test and exhibit at a lecture on the subject. The articles were then written, and publication commenced in this journal on October 7, 1910. As each section appeared, correspondents kindly drew the writer's attention to new plants. Among those firms who so communicated were the manufacturers of the County Plant. A short description of this apparatus appeared in this journal on December 2, 1910.

The arrangement and details of the plant promised well, and, but for great press of other research work, a personal inspection of the County petrol air-gas machine would have been made a few weeks ago. At the same time, it is only fair to point out that during the last two years there has been such a sudden rush on to the market of these new generating plants that it has been almost impossible to keep pace with the fresh arrivals. As the writer has already stated, it is quite probable that the majority are merely ephemeral—they have arisen, and

* The series of articles upon this subject appeared in our issues of September to December 1910.

will disappear like mushrooms. Unfortunately, the good plants have to fight against the prejudice caused by systems ill-devised and unsound. However, a few days ago the works of the County Lighting Company were visited, and some rough tests and a careful inspection of the plants in course of construction were made. As a result it is considered that the apparatus calls for additional comment.

Everyone is human enough to be pleased after he has pointed out details in engineering work which seem to him to be defective to notice such things remedied. It is therefore a pleasure to state that the plants inspected impressed the writer most favourably, and the following were the reasons:—

Technical Knowledge.

A fact which must have impressed the technical man who has looked into this matter must be that many of those engaged upon the manufacture of plants are not scientific men, and do not give evidence of any full knowledge of the elementary principles underlying their operation. In this respect the County people presented an agreeable surprise. Not only have they a staff well trained in science, but they apply their knowledge and the spirit of their training to their work. They appear to have made numerous small researches, and they evidently believe that the way to make sure that a sound job has been produced is to test it well before sending it out to a customer.

It is very easy to discover in the course of a few minutes' conversation whether a man knows his subject or is "bluffing," to use an Americanism which will possibly be pardoned because of its aptness. Now, a number of the people in this new industry seem to favour the methods expressed by the American word. Examples quoted from catalogues have already shown that fact clearly. In the excitement of private conversation people who possess patents will make wonderful statements which they will not put into cold print. The representatives of the County plant were perfectly frank. They knew the subject; they believed in petrol air-gas. Of course they said that their plant was the best on the market—every maker says that. But they differed from some makers in that they gave definite reasons for their belief.

Although a short description of the plant has already appeared in this journal, we think that a closer inspection has revealed certain points none too clear from descriptions; it is therefore proposed to sketch out the general features and generally comment upon the apparatus.

The County Plant.

The apparatus is of simple construction, but when examined closely and critically, it indicates considerable foresight and scientific attention to details. In general, the machine consists of two copper gas reservoirs, arranged as bell-shaped vessels standing in water-seals. One is about three times the capacity of the other, and acts as gas-holder and carburettor combined. The smaller acts as air-pump, being made of sufficient weight to give the necessary pressure. At the side of the air-pumping arrangement a small pump is placed, the stroke of which is adjusted so that the exact quantity of spirit necessary to carburet the volume of air delivered per stroke is supplied with it. We are convinced that the device is such as to ensure absolutely constant mixture. The necessary power is supplied by falling weights, and a cycle of operations is as follows: As soon as the gas-holder falls to a certain point, a catch is released which starts the machine working. The air-pump is lifted to the top of its stroke, a positively opened valve allowing it to become filled with air. At the same time the petrol-pump sucks in the requisite quantity of petrol. At the top of its stroke an ingenious ratchet and tappet motion stops the action of the weights and at the same time releases the air-drum. The inlet valve is closed by a spring, and the drum falls by its own weight, pumping the petrol into a spiral carburettor and causing the air to pass over it and evaporate it. As already indi-

cated, the carburettor is arranged on the surface of the water in the main gas-holder, the petrol floating on its surface, and the air being compelled to pass over it in a spiral path until it enters the gas-holder, from which it passes to the supply.

An illustration and description of details have already appeared on p. 362, issue December 2, 1910.

The gas made by this machine contains about 6 per cent. or more of petrol vapour, having a calorific value approximating to that of coal-gas. It is claimed for this mixture, with we think good reasoning, that—

1. In case of leakage it is no more dangerous than coal-gas (a negligible quantity).

2. There is no possibility of firing back into the gas-holder (a remote contingency, but a possibility if the gauzes are left off with gas containing $1\frac{1}{2}$ to $2\frac{1}{2}$ per cent. of vapour).

3. Less power is required to drive a rich mixture machine, the volume of gas dealt with being less.

The fact that this machine draws its supply from outside the building is an undoubted advantage from a fire danger point of view.

In conclusion we may say that after an exhaustive examination and test we are convinced that this machine is entitled to be placed with the best of the many others we have seen and tested, and is one which can be confidently recommended to those looking for a safe and reliable means of lighting country houses or villages.

Fire Insurance.

It cannot be denied that a great deal of anxiety is present in the mind of the average non-technical prospective purchaser of a petrol air-gas plant on account of fire dangers. Petrol is now so well known as an explosive and inflammable agent that the very word spells caution, especially to the non-technical man.

The best court of appeal in such a question is one of the front rank fire insurance companies. The writer has before him a private copy of certain rules and regulations which have been drawn up for the guidance of the chief inspector of one of the largest offices with a large connection in this country and on the Continent. The following recommendations appear:—

It is insisted that any apparatus (except an acetylene gas portable apparatus holding a charge of not more than 2 lbs. of carbide) for generating, purifying, or enriching gas must be in the open or in a building used for such purposes, only not communicating directly with any building otherwise occupied. In the case of petrol air-gas a provision is made so that the plant may be placed in a building (used only for housing it) communicating directly or indirectly by openings protected by double fire-proof doors with any building otherwise occupied, provided the spirit feed-tank be placed and filled outside, in the open air, and the feed-pipe be provided with an outside shut-off valve. Any reserve spirit beyond that which is contained in the apparatus and feed-tank must be kept at least 30 feet from any other building occupied by the insured. It is added, however, that if the local authority grant a licence the spirit may be kept in the open or in a brick or iron compartment at a less distance than 30 feet.

There is no doubt that the insurance inspectors themselves are rather nervous about the plants. However, there is the proven fact that the leading insurance companies do not increase the premiums on houses in which petrol air-gas is used, always provided that the above conditions are fulfilled, and that the plant is considered reliable. There are, of course, machines on the market which are quite satisfactory from the fire insurance inspector's point of view.

The south transept of Selby Abbey is to be rebuilt at once at the expense of Mr. W. Liversidge, J.P., Selby, according to plans prepared by Mr. J. Oldrid Scott, F.S.A., architect. The transept was wrecked in 1690 through the fall of the upper part of the central tower. The work, which is estimated to cost 8,000l., will mark the final stage of the restoration scheme undertaken after the disastrous fire in October 1906. A prominent feature will be the south window, 36 feet by 15 feet, and containing six lights.

THE ARCHITECTURAL ASSOCIATION.

AN ordinary general meeting of the Architectural Association was held at Tufton Street, W., on Monday last, combined with a meeting of the Camera, Sketch, and Debate Club. The election of Mr. W. J. Allcorn, Mr. G. W. Capes, and Mr. H. G. Wicks was agreed to. Votes of thanks were passed to Mr. Andrew Oliver for presenting to the photographic collection a number of slides and negatives, and to Mr. Ernest Runtz for presenting to the Library thirty-two volumes of the *Revue Générale de l'Architecture*, by M. Cesar Daly. Mr. Arthur Keen, President, who was in the chair, announced that it was necessary there should be a much larger attendance of members at the recently-opened Life Class if it was to be continued after the present term. Mr. THEODORE FYFE then read his paper entitled

The Atelier versus the Builders' Yard.

It is with the greatest diffidence that I bring forward this subject, because I am fully aware that it demands the wisdom and experience of some one much more versed in building than myself; but I have thought it not out of place because we, of the younger generation of architects, must think clearly and reasonably about our art, and have an adequate basis of ordered process in our application of thought to building form, especially now that we are progressing so rapidly with systems of education in this country. The subject is one that is always with us. My first personal recollection of it dates from about 1898 or 1899, when Mr. Harry Wilson read a paper, followed by considerable discussion, at the Architectural Association. Then, as now, we had our Philip Webb and our Lethaby, and they have a considerable following in these times. On the other hand, we have had, for a much longer period, the great academic teaching of France, forming what I signify as the "atelier." Subsequent to 1898 there are only two utterances that I will draw attention to, though, of course, there have been many others. The first is a paper entitled "A Review of the Tendencies of the Modern School of Architecture," read before the Institute by Professor Pite in 1900, and the second is a very recent paper, "Architecture or Building," read at Birmingham by Mr. Schultz. I do not intend to refer to either at any length, but will take Mr. Schultz first. Referring to day-school training, he says: "I must say, quite frankly, that, in my opinion, this theoretic training is not going to make for good building; in fact, to be quite candid, I am not hopeful that a good general type of modern building will be seen until all we architects are abolished, swept away, root and branch." And then he goes on to say that the *craftsman* could, and should, be taught to do the architect's work in addition to, or as part of, his own. Further, he says, "meanwhile I would plead for a practical basis in the training of your youths. Send them first to do work and see work done, and to learn and know about the nature of materials and their putting together; teach them architecture as engineers are taught. Don't bother too much about design."

The first part of this quotation is quite too big a subject to discuss here. I would only say, what about the interregnum if architects are to be swept away? And, supposing that could be bridged, would we not find that our great modern buildings would of necessity fall into the hands of engineers, with craftsmen to work for them merely as superior decorators? I say "of necessity," because it is surely inconceivable that craftsmen could be entrusted to take up the problems of design, in its larger sense, involved in our great modern buildings. They might *contrive* fine bits here and there, even whole departments of a large building, which, when one thinks of it, is perceptible in a lot of old work; but one could surely get no great building, fine throughout, on such principles?

Now let us turn to Professor Pite's paper. He discusses precisely the same question, a possible revival of the crafts for all practical building needs; but he finds no solution therein. He admits that the minor or "decorative" building crafts are already on a sound footing, thanks to William Morris chiefly. "But" (here I quote him) "the major crafts of building construction are still outside the pale of their decorative sisters, and, indeed, are dependent on the master-architect's training, and upon his paper and pencil, for their usefulness or their beauty. We observe the signs of revivification in subsidiary cases; are there not prospects and hopes for the greater ones?" He sorrowfully admits not, and says later, in words which I would have you specially note: "The architect, whether he wills it or would have it otherwise, is compelled back upon himself and upon his own intuition and experience, for all discernment and

expression of the material and its craftsmanship. The architect at the present day is indeed the designer and master-craftsman. He goes backward to the status of the actual workman to bring his work forward to the point of true architecture."

I think we will all agree there can be no real building without precise and intimate knowledge, and I would further submit there can be no great building, that we call architecture, without a wide knowledge of tradition and example. The big man is not confused and crowded out in knowing all he can that assists his work, and in seeing all he can that has been done elsewhere. We can have no great national style without first having international experience. The only true receptivity is that of the large, healthy, creative mind. Recognising this, one feels it impossible to tie oneself down to either an atelier or a builder's yard. In the Paris Opera House, certainly one of the greatest buildings of modern times, we see the perfect flower of the system that produced great Prix de Rome men; we see a modern academic design, a design founded on the approved training of the schools in France; but we see much more than this, nothing less than a great building that any builder, properly so called, who loves his craft, would joyfully participate in; and we see a thing beautiful as an organic whole, within and without, the marvellous creation of a truly great architect. The academic and the practical must co-operate to produce such a building as this.

In any consideration of this subject one is bound to come full tilt against old work. Its claims are always sufficiently in evidence, and need no apology. It is right thinking about it in the mind of the student that is essential. On the one hand, he must recognise that we have lost tradition in the sense that the great mediæval builders had it. Nothing could have produced such great works as the west front of Rheims except a religion that was childlike in its trust and firm faith—we dare not believe anything else—and an instinctive hold on tradition. Perhaps it is because we have lost both, in the sense of the earlier builders, that we are utterly unable to clearly comprehend how their greatest works were raised, and flounder about between the one-man theory and the theory of the many workers, more or less inspired. We know that we find it supremely difficult, if not impossible, to do similar work that has the same extraordinary homogeneity and singleness of tone. So the student should realise what tradition means and his own relationship to it. On the other hand, he must recognise that the needs of his time demand of him a training in the most frankly intelligent criticism of the whole modern outlook, a criticism which leads to the appreciation of what he has been trained to regard as the *best*. He must realise that his achievement is a thing of thought based on a principle of selection as thorough as it is ruthless; thorough, because he must have principles, the more the better; ruthless, because there is a mass of undesirable opinion hanging about the whole game, something which clouds the issue, losing many a man in shallows, uncertainties, and weak work.

To say about a method of doing something, "This won't be satisfactory; it was done at So-and-so, and was bad," may sound pedantic, but it is in the right spirit. This is the true liberalism of art, which can advance, not because it despises, but because it fears and knows; not contempt, but knowledge, is what we want.

The mass of undesirable opinion before referred to hangs particularly about the subject of old work. Those who make a fetish of it because it is old work are largely responsible for this. Setting one's face against such an attitude does not necessarily mean that the student is a foolish iconoclast. It is only ignorance that is abusive.

But, you will ask, what is the training that will enable the student to appreciate only the best, and of what does the best consist? Now, here, I think, is the value of the atelier; for it is only, it seems to me, by some such system as the atelier that we are able to find an answer to this most important question. It is through lack of real, systematic, profitable training in design that most of the educational systems in this country suffer—not so much in design, perhaps, as in principles that *govern* design. An architect, I submit, must most emphatically be trained in certain aspects of the theory of his art, just as certainly as the musician. The two arts run parallel, and are very similar in this respect. The gain to the student is immense when one can point out the world that lies before him if he is able to recognise that certain proportions and rules—which are at least as old as the Greeks—are discoverable in all great buildings.

To the free and elastic mind this will not become a

fetish; far from it: it will recognise the limitations of all rules; but, on the other hand, it will gain immensely in stimulus by adding, bit to bit, and will advance thus by real experience. The old weapon, having served its day, will form part of the armoury if it is sound, and be thrown away if it is bad, and a newer and better one will take its place. Here, again, ought to be progress.

The study of *structure* is something which appears to be more intensely modern than any other aspect of the question; but is it so very modern after all? Here is our "builder's yard," but much more. On the one hand, it is all that old work can teach us, as material evidenced in architecture; and, on the other, it is the engineer's table, the plumber's shop, the mason's yard, the multitudinous crafts that appear in a really great building. It is just this about the Paris-Opera House that fascinates. This is the ideal, but how seldom achieved! And now, when I speak about the "builder's yard," it is perhaps hardly necessary to explain that I mean by it the extreme that it represents—the view that the young architect must learn to handle tools himself before he can build aright; that he must be a plumber, or mason, or carpenter, and, if possible, all of them, in some measure, if he is to have that intimate knowledge of material that alone produces good work. Here I will state my own position. I recognise that the architect needs this intimate knowledge, this subtlety of appreciation in material; the knowledge that can enable one man to build a beautiful gable in brick, while another, with exactly the same bricks and exactly even the same form of gable, produces something which is quite ordinary. But where I demur is in believing that architecture is only this, and that there is not another, and larger, side. To do the exponents of the "builder's yard" justice, it is only the narrower among them who really believe the contrary, or act as if they did. It is this pernicious hatred of the Renaissance, and of all that people are pleased to call sham building (which in some form or other is as old as any building that ever was), this one-legged theory that the column and the order are a damned thing, that is responsible for half the mischief. All building is surely part of one great craft, the greatest constructive craft there is, whether it be evidenced in a Surrey cottage or in Westminster Cathedral: the one is but the other in little. Thought, care, selection, and trained experience are requisite for both, though the relationship of parts to the whole is somewhat different in each. It is at this point that we appreciate the fascination of Professor Lethaby's remark, quoted in Mr. Schultz's paper, already mentioned. "Design," he says, "is merely contrivance, the doing of work in an ordinary way, just like cooking." On the other hand, has not Professor Lethaby been lately much occupied with the principles that underlie Greek building?

(To be concluded.)

LEICESTER BOARD OF GUARDIANS v. TROLLOPE.

A CASE relating to the responsibility of architects was begun on Monday last, before Mr. Justice Channell, in the King's Bench Division. It was an action for alleged negligence brought by the Leicester Board of Guardians against Mr. John E. Trollope, surviving partner of the firm of Giles, Gough & Trollope.

Mr. Hugo Young, K.C., who appeared for the plaintiffs, said that this action was brought against Mr. Trollope as the surviving partner of the firm who were the architects for a very large infirmary built by the Leicester Board of Guardians. It was discovered that there was very serious dry-rot in the building, so much so, indeed, that 2,000*l.* or 3,000*l.* had been spent in taking up the floor. By the time the discovery was made it was too late to recover from the builders, who had got their final certificate. The building was begun in September, 1902. It was completed in 1905, and the final certificate was given to the builders in 1906. In the infirmary were four large blocks of two wards each, and also a large administration block. It was not until February 1908 that anything wrong was discovered.

When the subject was investigated, counsel continued, it was discovered that instead of there being beneath the floor a layer of concrete 4 inches thick, and the joists laid on this and bedded round with a finer concrete for 2 inches, all over this building the builders had taken wooden pegs (thousands of them), driven these pegs into the ground, and, having thus got a level plane, had nailed the joists to the top of these

pegs and filled in the concrete at one operation. A direct communication with the ground was left through these pegs. Each peg acted as a pipe for drawing up moisture, and the system destroyed the whole purpose for which the concrete was laid down.

Mr. Young then handed specimens of the dry-rot fungus and concrete to the judge.

His Lordship: I hope the rot will not communicate itself to the woodwork of the court. We have already had arbitration regarding this building.

Continuing, counsel said the flooring got into such a state that it had to be taken up. The plaintiffs did not attribute, Mr. Young said, any want of good faith to defendant and his firm. They had placed too much faith in other people.

As to the position of the clerk of works, Mr. Young read from one of the documents in the case that it had been agreed that the clerk of works was to be merely the inspector and assistant of the architect.

The hearing was adjourned.

On the resumption on Tuesday,

Mr. Pollock, K.C., submitted that the defendant was not liable. The work was not done in accordance with the specifications through the complicity of the clerk of works and the builder. By their acting in this manner there was a saving of cost of about 422*l.* The architects were lulled into security because throughout the time the work was going on the clerk of works appeared to fulfil his duties, and made a number of complaints regarding various matters. As to the alleged undertaking on the part of Mr. Trollope to bear the cost of putting matters right, he submitted that it was made without prejudice and without knowledge of the extent of the harm.

Mr. Trollope, the defendant, said that the clerk of works was appointed to see that the specifications were carried out.

Cross-examined by Mr. Hugo Young, witness said that in his view he might assume that the whole of the plans and specifications were being carried out unless his attention were drawn to something special.

And, suggested counsel, it is not any part of your duty to supervise the clerk of works?—Certainly; general supervision, to see that the scheme is carried out.

Is it not part of your duty to see that proper timber is used, for instance?—It is my duty to have a look round.

Is it any part of your duty, if the clerk of works tells you the timber is sound, to see whether it is or is not?—Yes.

If he tells you the concrete is properly laid, is it any part of your duty to see whether he is truthful or not?—No; he is there to see the concrete is the proper depth.

What is the difference between the concrete and the wood?—One is mixed and the other is natural. We cannot be there to see every yard of concrete mixed.

Might you not say, "Leave a portion of this open, that I may see it is properly laid"?—You might do that if there was suspicion of fraud.

The Judge: It would be equally easy for the other man to make that portion all right.

May I take it that from first to last you never made the slightest effort to test whether this important matter of flooring was being properly done?—I took it for granted it was being properly done.

You never made the slightest attempt to check it?—No.

Did you ever appoint anyone beyond the quantity surveyor and the clerk of works to test any portion of this to see whether your plans were being carried out?—No.

Do you really suggest that in concrete laying, and the laying of floors where dryness is so essential, that it is not the duty of the architect to see that his design is properly carried out?—Not with a proper clerk of works.

It is not usual to check clerks of works?—No.

Then, according to your judgment, the person who is responsible for the plans being carried out is the clerk of works?—Yes, in detail.

But you don't call an acre of this concrete being laid with pegs a matter of detail?—No.

If it was not your duty to see in detail what was being done, was it not your duty to see your principles were being carried out?—I don't think so.

Did it occur to you the clerk of works might misunderstand what you wanted?—He could not misunderstand from the drawings and description.

So far as the clerk of works is concerned, you do not suggest he was not a fit and proper person to appoint?—I do now.

If you had chosen to check him, instead of relying on him, you could have prevented all this injury?—Yes; but there was no reason why I should have checked him.

You got 5,000*l.* out of it?—Yes; it was not a full fee, I know.

The Judge: I don't think the amount this gentleman got out of it has anything to do with the question.

Mr. E. T. Hall, F.R.I.B.A., gave expert evidence as to the relative duties of architect and clerk of works. The duty of an architect was, he said, to see that the general scheme of design was carried out, that in bulk the materials were such as were fit and proper to be used, and that the works should all co-ordinate to give effect to the building design. The clerk of works, on the other hand, should see that the detailed method of construction specified by the architect was carried out. It would be physically impossible, added the witness, for the architect to see one fiftieth part of what is in the building.

Cross-examined, witness said it was impossible, for instance, for an architect to see that all the walls in the building should be of specified thickness and built as specified. Unless an architect were constantly on the building, he must rely on the clerk of works.

Do you suggest, said Mr. Hugo Young, that it is not right for the architect to ask whether they are carrying out his idea about the concrete?—That is not what occurs between an architect and a clerk of works. The architect assumes his ideas are being carried out unless something occurs which leads him to think they are not. "You assume the thing is being done and superficially you examine it," added the witness a minute later.

If he had looked at this work, would he not have seen the pegs?—No, because there would be fillets at the top.

Four inches of concrete had to be laid before the fillets. If he had examined it at that stage, would he have seen this acre of pegs?—There was no acre of pegs. The pegs were laid in rooms. If he had visited it at the time, of course he would have seen the pegs, but it is only the architect's duty to see that superficially things are as he expects.

If nothing strikes his eye, he is not bound to make investigation?—No; it is physically impossible to test things in the way you suggest.

So that, granted a fool or a fraudulent clerk of works, I, as building owner, get no security by paying the architect one and a quarter per cent. for supervision?—You get the architect's general knowledge of men. He would discover if the clerk of works were a fool.

But the building owner gets no security against the clerk of works and the builder putting their heads together?—I don't think you can ever prevent fraud.

Mr. C. F. Doll, F.R.I.B.A., an architect, of Bloomsbury, said he went down to examine the Edington building on November 14 last. The driving in of the pegs would not show that the work was being done wrongly, as pegs had to be used to get the level. In the opinion of the witness the superintendence of the architect consisted in seeing that the work and drawings as regarded dimensions and architectural features were properly carried out. The architect selected the samples of material and sent them to the clerk of works, whose duty it was to see that the material delivered conformed to the sample. The clerk of the works had to see that all details were properly carried out, and it would be perfectly impossible for the architect to see that the concrete was properly gauged and laid.

What do you estimate the builders saved by their method of laying the floor?—About 400%.

Cross-examined by Mr. Young: Therefore the architect has certified for 400% work more than he ought to have done?—The builder has got 400% more than he ought to have got.

His lordship said he was sorry to have to give judgment against the defendant in regard to a matter in which he was not greatly in default, and in regard to which the plaintiffs had said they made no imputation against him. He had been much impressed with the way in which the defendant had given his evidence. The facts were extremely clear. There was nothing in the contract which differed from the ordinary building contract, and it contemplated the appointment of a clerk of works, who was to assist the architect, the position of such a clerk being one which was well understood. The only special thing about the contract was that the architect was to take substantially less fees than usual. He could not, his lordship continued, help seeing that the dry rot was brought about by collusion between the clerk of works and the builder, though it seemed to him that the builder would not be entitled to rely on the certificate given him by the defendant. The witnesses had agreed that in matters of detail the clerk of works had to see what the architect could not be expected to see. The architect knew, however, that this flooring was a very important matter, and

that he must see that it was done properly. If the defendant had taken steps to see that the first block was done all right, and had left the rest to the clerk of works, that they were to be done in a similar manner, he would have had some doubt whether defendant was liable. He did not think that the excuse of the architect that he thought the clerk of works would see that the floor was all right was sufficient. It seemed to him that the laying of the floor was not a detail which could not justifiably be left to the clerk of works; it was a matter of design. He thought that on the agreement to put the matter right the plaintiffs would also have succeeded. He must repeat again that he was sorry to give judgment against the defendant, as he had behaved exceedingly well in the matter and had given his evidence in a very proper way. It was a very unfortunate thing for the defendant.

Counsel stated that the parties would endeavour to come to terms as to the amount so as to avoid the necessity for a reference. There would be liberty to apply to the Court if necessary.

Judgment was entered accordingly, with costs.

COMPETITION NEWS.

APPLEBY.—Plans by Mr. R. M. Rigg, Penrith, have been accepted, out of sixteen competitive designs, for a Post Office and a Conservative Club between the Market Hall and the High Wiend at Appleby, Cumberland. Premiums of 10% and 5% have been awarded respectively to Messrs. Garside & Pennington, of Castleford, and to Mr. R. P. Blackburn, Carlisle.

ISLE OF MAN.—The award has been published of the recent competition organised by the Douglas Town Council for designs for a pavilion and laying out the Villa Marina Estate with pleasure grounds, &c. Professor S. D. Adshead, the assessor, awarded the first premium of 200% to Messrs. Percy Robinson & W. A. Jones, of Albion Street, Leeds. Premiums of 100% each will go to Mr. S. Ramsey, of Herne Bay, and Messrs. J. Cocker & E. W. Hilton, of Altrincham, Cheshire.

NORTHAMPTON.—The Education Committee have decided to invite competitive designs for a secondary school for girls from architects practising in the borough and county. The designs are to be for a building that will accommodate 400 girls, but at the present time it is only proposed to erect buildings to accommodate 300 scholars. The designs will be required to show how the extension can be made when the additional room is wanted. An assessor is to be appointed.

ILLUSTRATIONS.

THE PICTURE HOUSE, NEW STREET, BIRMINGHAM.

THE cinematograph theatre known as "The Picture House" was opened in October last, the architects and surveyors were Messrs. NICOL & NICOL, of Birmingham, and Messrs. NAYLOR & SALE, of Derby, Mr. THOMAS JOHNSON being the builder.

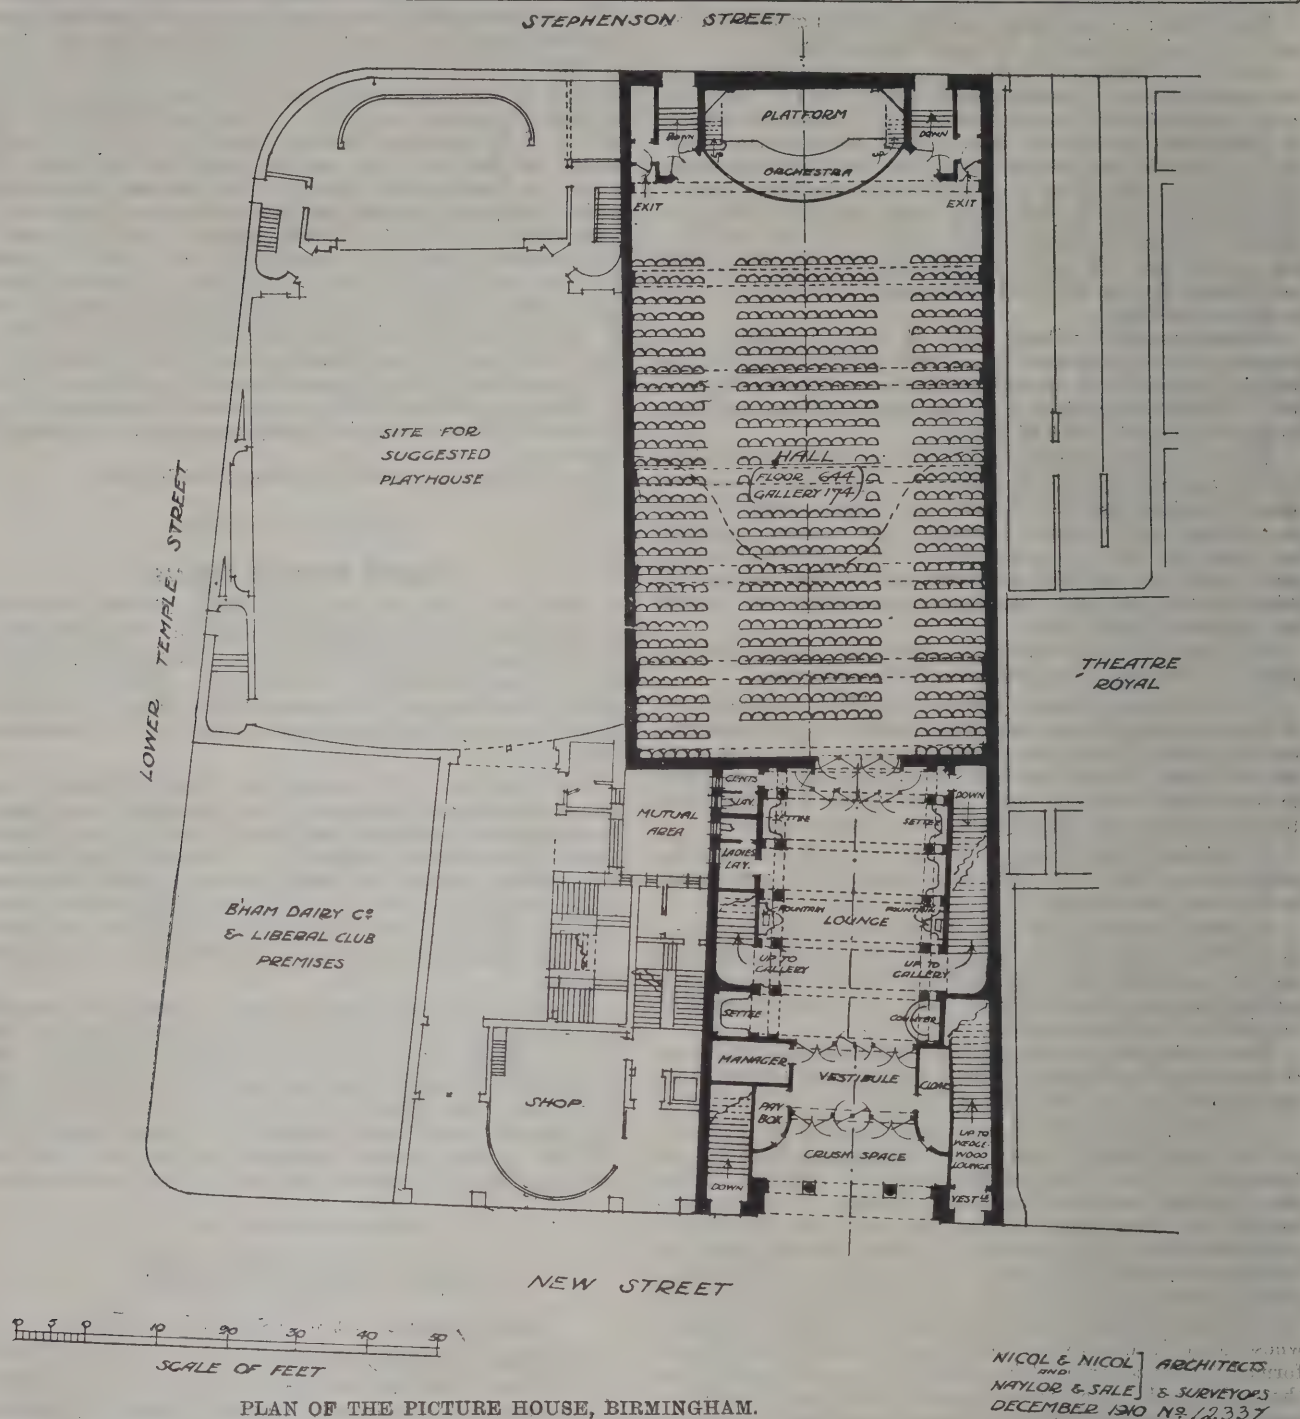

The theatre proper is provided with wide entrances and exits to two streets, and is about 100 feet by 50 feet, seating about 1,000 people, and a sloping floor with a balcony at one end.

It is a lofty hall with a segmental ceiling and a large semicircular recess in which is framed the picture screen.

The architectural treatment is an arcade with panels and groups of figure subjects combined with the architectural features. The ceiling is divided into panels with richly modelled ribs, and has a number of circular panels glazed with leaded lights, through which daylight or electric light can enter, under the complete control of the operator.

The decorations are carried out in fibrous plaster and colour. The theatre is entered through a spacious lounge with a colonnade of Doric columns on either side, from which spring a coved ceiling richly modelled and moulded; the niches between the columns are provided with groups of statuary over marble fountains, and settees surmounted by decorated panels, the floor being laid with marble with mosaic enrichments, and partly covered with a rich carpet.

On either side of this lounge ascend the two wide stair-

PLAN OF THE PICTURE HOUSE, BIRMINGHAM.

cases conducting to the balcony, which is fitted with more luxurious seats, and, as a higher price is charged in this part, all the appointments are correspondingly better finished.

The operating room is behind the balcony, and is considered the most up-to-date of its kind yet erected. It is completely cut off from the remainder of the theatre, and is provided with a concrete floor and ceiling and a separate scheme of ventilation. Adjoining the operating room is a special room for rewinding the films.

Over the principal entrance next New Street is placed the ladies' tea-room, which is a large apartment decorated with great refinement and finished in the Adams style, and blue and white plaques of "Wedgwood" character give the key-note for a scheme of colour which is carried into the furniture and every detail in the room. The elevation to New Street has been carried out in "Carrara" ware, in a design which expresses the character of the building. The principal feature of this façade is a large semicircular arch in which, considerably recessed, are placed the more important windows.

The pavilions supporting this arch include the entrances to the basement and upper parts of the building,

and are carried up well above the adjacent theatre in the form of towers.

The Carrara ware is relieved by inlays of green and gold tiles in patterns and bands.

The elevation to Stephenson Street is decorated in less costly materials, chiefly bricks, which are specially made and laid with a bold white joint, the architectural features being worked in cement. The heating and ventilating have been given special attention, the smoky air being extracted by powerful fans, and replaced by air which has been washed, heated, or cooled, as may be required, and distributed to every section of the building by mechanical means. The lighting generally is reflected from the ceiling, and produces a very pleasant and restful effect.

The interior decoration has been carried out from the designs of the architects by Messrs. MARTYN, of Cheltenham, and Messrs. HAMPTONS, of London.

The heating and ventilation is the work of Messrs. HADEN, of Trowbridge, and the stained and leaded glass that of Messrs. HARVEY & ASHBY, of Birmingham.

The St. George's Guild have executed the marble and ornamental cement work, and the electroliters were made by the Birmingham Guild of Handicrafts.

THE ILLUMINATING ENGINEERING SOCIETY.

THE LIGHTING OF LIBRARIES.

At a meeting held at the Royal Society of Arts on Monday, January 16, Professor S. P. Thompson, F.R.S. (President) in the chair, an important discussion on "The Lighting of Libraries" was held.

The PRESIDENT said they met under particularly agreeable circumstances that evening, as it was the first occasion upon which they had actually met in co-operation with another professional body of great distinction. They met in co-operation with the Library Association in order to discuss questions concerning the lighting of libraries and the proper rules for specifying the amount of illumination in libraries under different circumstances. The matter would be introduced in three short papers, after which certain statistical facts would be placed before the meeting which had been collected quite recently concerning the actual lighting of certain libraries.

Mr. L. STANLEY JAST (Honorary Secretary of the Library Association, Chief Librarian of the Croydon Public Libraries), read a short paper on "Library Lighting," as follows:—

There are really two problems of library lighting. The first is the problem of lighting rooms for purposes of reading and writing, which is of course in no way different from the lighting of banks, offices, and similar apartments. The second is the lighting of bookcases and of gangways between bookcases; this is the specific library problem, and the one which is by far the most difficult of solution.

Dealing with the general problem first, one may perhaps speak of two more or less distinct periods in the lighting of libraries. The earlier period is marked by general lighting, usually obtained from lights or clusters depending from the ceiling or roof, with little or no point or local lighting. The results have rarely been happy. The architect has only too often arranged his lights according to purely decorative or architectural considerations, without paying any regard to the position of readers and tables. Hence it was no uncommon thing to see a roof or the passages between tables brilliantly lit, while the tables themselves were left in comparative obscurity. The results obtained by this happy-go-lucky system—by no means unknown even now—were worse as a rule when the source of illumination was the electric lamp. The absolute necessity of obtaining light where it was wanted, whether there was any light anywhere else or not, brought about the second and present period, in which the emphasis seems to be laid on point lighting, with a comparative neglect of efficient general lighting.

Mr. Jast presumed that there can be no question as to the undesirability of point lighting in itself, more especially when it is the primary source of illumination, and not subordinated to a scheme of general lighting.

That being so, it appeared to him that point lighting should be avoided wherever possible, and he contended that it should and could have been avoided in many recent examples of library lighting. One rarely sees in this connection proper treatment of the walls of the apartment, so as to provide good reflecting surfaces, and so aiding not only in the thorough diffusion of the light, but effecting a considerable economy in the direct illuminating power. Excellent results have been attained in one magazine room by suspending unshaded electric incandescent lamps about one foot below the ceiling and colouring the walls cream; there are no table lights at all.

Where, as is the case in many reference libraries, the walls are utilised for shelving books, no reflecting surface other than the ceiling is, of course, available; even then, however, if the bookcases are not carried up to the full height of the walls, it would probably be worth while to utilise a space above the cases in this way.

It is clear, however, that in many, perhaps in most, reference libraries point lighting for the reading tables or desks will be a necessary evil. The question then arises as to whether suspended lights over or standards on the tables are to be preferred. If a standard is chosen, what is the best height above the table and design of standard; and, more important still, what is the best form of shade?

The only scientifically constructed shade is, presumably, the holophane; the objection to it for table lamps is that you have a bright light immediately above the eyes, not, of course, so accentuated as in the case of the unshaded lamp, but sufficiently annoying nevertheless. After trying several varieties of shade, the speaker preferred, on the whole, the ordinary cone-shaped opal shade, as deep as it is possible

to get it, so that the reader seated at the table is unable in any ordinary position to see any part of the lamp itself.

Now comes the special problem of library lighting, which appears to be sufficiently difficult to deserve all the attention and skill which the illuminating engineer can bring to its consideration.

The problem is, briefly, that of generally illuminating a narrow gangway between bookcases, of an average width of from 3 to 4 feet, and at the same time lighting two vertical walls of books, covering an average width of, say, 9 ft. 6 in. to 10 ft., with an average height from the floor of about 8 feet. Mr. Jast did not remember to have seen an absolutely satisfactory solution of this problem, and was inclined to doubt if an absolutely satisfactory solution is possible. On the whole, he believed that the best average results are achieved by lights over the centre of the gangway.

The alternative is to employ lights on the cases. In the Croydon Library linolite lamps are fitted on the cornices of the cases, so arranged that the lamp on one case lights the books on the opposite case. The result is fairly satisfactory, the main objection being that the lamp is fully visible to the eyes when examining the upper portion of the case. Fortunately one does not expect readers to do more at a case than read the titles of the books required; while the absence of fittings projecting from the tops of the cases is a distinct aesthetic gain.

Mr. Jast said that he did not know if any library had attempted to light bookcases by what is known as pattern 21 of the linolite, hung from a fitting projecting in front of the case; this pattern, he was informed, was used for lighting pictures.

It had been suggested that it might be practicable to carry up the cases so as to provide a certain amount of reflecting surface to aid in the diffusion of the light.

In order to properly light the lower halves of bookshelves he thought this should be done from below, in the same way that footlights were used for lighting the front portion of a stage. He would cut a longitudinal trough in the floor along the front of the bookshelves, at a suitable distance away, and cover it with glass of the necessary thickness, and in this trough place lamps with reflectors so arranged that the light would be thrown directly on the shelves. To prevent any light reaching the reader from below the trough might have an opaque lip on the edge furthest from the case. For economical and other reasons he would arrange for a bar to run the whole length of this trough, which, when the reader stood upon it, would switch on the light and automatically switch it off when the foot was removed. The lighting of the top of the shelves could be by ordinary centrally hung lamps or from bracket lamps projecting from the tops of the shelves. He also commented upon the lighting of the central reference library at Croydon, where there is an electrolier suspended from the roof. He said this form of lighting, which was designed purely from the decorative point of view, ought to be avoided, as it lighted the roof and nothing else. Many years ago at Croydon they ceased to use these electroliers, except for the centre lamp in each electrolier, and the tables were now lighted by standards, connected, he regretted to say, by flex drawn from the electroliers. It seemed to him that when corporations went in for electric lighting—at any rate at economical periods—they very often perpetrated systems which they would immediately condemn in any other buildings but their own.

By way of conclusion, Mr. Jast stated the points which occurred to him as those on which the opinion of illuminating experts would be valuable:—

1. Is it desirable to do away with point lighting as far as possible, relying wholly or mainly on well-diffused general lighting?

2. How far should wall surfaces be employed as an agent of diffusion?

3. If tables are lighted locally, which is the most satisfactory form of shade?

4. What is the best solution of the specific library problem of lighting bookcases, especially when these are divided by narrow gangways?

Mr. J. DUFF BROWN (Borough Librarian, Islington) read a paper entitled "The Artificial Lighting of Libraries," which dealt with certain problems and difficulties in the artificial lighting of libraries which have been observed by different librarians, whose solution could be discussed and perhaps suggested by the practical experts present at this meeting.

Like the ventilation of public buildings, their lighting has always been a contentious subject, but after reading

much and observing more, his own personal feeling was in favour of getting as near to Nature as possible. For that reason a plain open window and a light as nearly like daylight as can be obtained seemed to be ideal conditions. In many cases, however, it appears to be impossible to get anything near to natural conditions, owing to the fads or mistakes of architects and hot-water, ventilating, and electrical engineers. These specialists are nearly always in conflict, and as each has special requirements, every public building is the victim of a series of compromises and modifications which do not invariably yield satisfactory results. As regards libraries, these conflicting factors affect the artificial lighting in a number of ways, and each department somewhat differently. He proposed, in dealing with these separate departments, to assume that only electric light is contemplated, that being the most mobile, clean, and effective light for library purposes.

He thought it quite possible to obtain a perfect artificial system of illumination in any building, provided the occupier is prepared to pay for it, but the human tendency to economise on the wrong things prevents this happy condition from being often obtained. Economy with regard to expenditure on lighting is compulsory as far as municipal libraries are concerned, owing to straitened means, and in a good number of cases this is the reason why many municipal library reading-rooms are badly lighted. Another reason is the fact that the lights have been arranged as symmetrically as possible to match the architect's ceiling panelling or other decorative whimsies, and the result is, in many cases, that while a pleasing design is obtained, it is only effective during daylight, because, as night advances, the room is only illuminated by certain points of light, generally in the wrong places.

To deal first with the reference department. The problem here is how to light reading-rooms arranged for different systems of administration and fitted with alcove or ordinary wall shelving. The lighting for a reference library in which readers are allowed access to the shelves must be arranged so that the bookshelves will be as well lighted as the reading-tables, and it is necessary to light the books so that their titles can be easily read, and to avoid the shadows of the readers being cast over the shelves. This raises the question of local *versus* general lighting, on which considerable difference of opinion exists.

In reference departments where access to the books by readers is not permitted, the question of lighting the book-cases or stacks is quite a minor point, and only the reading-tables need be thoroughly well lighted. In general, where readers are not allowed access to the shelves, the books are arranged in stacks behind barriers and not round the walls in alcove or other forms. The problem in the reference department, then, is, first, how to illuminate reading-tables effectively, whilst, also, in the case of open-access bookshelves, making the titles of the books and the classification guides perfectly clear to readers.

In newsrooms or general reading-rooms the main problem is how to light newspapers spread out on sloping reading-stands, either arranged against the walls or standing across the room at right angles to the walls. If the lighting is arranged for each stand independently, it means that the fittings become fixtures, a disadvantage always associated with wiring which has to be conveyed along the floor and attached to tables or stands. For this reason his own preference was in favour of having the lights hanging from the ceiling, independently of furniture, so as to obtain complete adjustability whenever required. There is hardly any library in existence which has not at some time rearranged its fittings and furniture, and it is often difficult to make alterations without overhauling the whole of the lighting apparatus.

In lending departments arranged for indicator charging it is necessary to have the indicator itself and the counter thoroughly well illuminated on both sides, and it has occurred to me on several occasions that a long tubular light, arranged close to the indicators on the upper margins, so as to illuminate downwards, would be an improvement on any overhead system which casts the shadow of the borrowers over the numbers. This method has been tried in libraries where the readers are permitted direct access to the shelves, and it is claimed that the arrangement prevents shadows from being cast on the books. It is doubtful, however, if the lower shelves are as well lighted as the upper ones. Where readers are not permitted to have access to the bookshelves the ordinary hanging lamps are quite sufficient, provided there is nothing in the construction of the bookcases to obstruct the light.

The lighting of other departments is very much the same

as in the three main departments dealt with, and the only other point remaining to be mentioned is the lighting of the exterior of the building, which, from the point of view of advertising the existence of a library, should be made more effective than it is in most cases. After nightfall, in a large city, the most conspicuous public buildings are theatres, music-halls, and taverns, and that is so because some effort is made to illuminate them outside. Most public libraries, and particularly those which have no reading-rooms at the front, often look as dark and dull as if they were uninhabited.

The chief problems of library lighting may be summarised as follows:—

1. To light reading-room tables so as to avoid glare in the eyes of readers.

2. To prevent the casting of strong single or multiple shadows of any kind.

3. To avoid fixing furniture or fittings in permanent positions; and

4. To ensure the illumination of the room generally, as well as the tables.

5. In open-access lending or reference libraries the illumination of the bookshelves should be arranged so as to avoid as much as possible the shadows of readers falling on the books, and also to ensure the lighting of the lower shelves.

To obtain these various results it appears to me that, whatever kind of illumination is used, it is necessary in most cases to adopt general lighting, reinforced at all weak points by local lighting.

Mr. JOHN DARCH read a paper on the same subject. He took the municipal or popular library as the typical subject for consideration, although his remarks would be equally applicable to either of the various special or other libraries—the principles involved being in all cases the same, the details varying from those of the municipal library only so far as necessary to meet special requirements.

The more one thinks upon the subject the stronger becomes the conviction of the need for a complete and perfect system of illumination in every public library. Continuous reading is a great strain and renders the eyes very sensitive to perverse influences, and, therefore, every possible provision should be made for the needs and comfort of the reader. But what are the facts? There was not, to his knowledge, a library in London, if in England, however luxurious it may be in other respects, that is provided with satisfactory lighting arrangements, most of them being illuminated in a manner that would answer equally well for a warehouse or a restaurant. We all know and approve the plea for public libraries—the age demands them—but where is the wisdom in providing books without adequate and safe means of reading them.

Experience of library building and fitting leads one to the conclusion that there is no alternative but legislation. If an Act of Parliament has been found necessary for factory lighting it is clearly no less necessary for the public library, the owners or controllers of which should be compelled to provide sufficient and satisfactory illumination or to close the library as a public nuisance.

Speaking to librarians, who are always beset by the difficulties of finance, and who look upon the ideal with the sad feeling that it is also the unattainable, and therefore not within the realms of discussion, he wished to maintain that the ideal *must* be the goal, and that in matters of public health it is false economy to stop short of it. Be as frugal and judicious as possible in our expenditure upon the less essential features, but not in this.

The first principle of library lighting to be emphasised is that there must be a general lighting of the reading-rooms, distinct from and in addition to, the local lighting of the desks, &c. To rely upon general lighting alone, as is done in perhaps the majority of libraries, is a great mistake, being both a useless waste of light and a failure as far as reading utility is concerned.

For general lighting it is not necessary to have more candle-power than will be required to see about the room—0.75 foot-candle should be ample—and it should be soft and well diffused; which it would be if the light were derived largely from the illuminated walls and ceilings.

If the room is lofty there is nothing better or more economical than an arc lamp, or, better still, a regenerative gas or Wenham ventilating lamp, provided they are well above the sight line. Whatever lamps are used they should be placed only just far enough below the ceiling to avoid dark shadow contrasts thereon and to admit of its being well illuminated.

The worst general lighting is that which is most common,

yet which has been specially recommended by a library expert, viz., plain opal shade pendants at equal distances apart, and about 8 ft. 6 in. from the floor. In this arrangement the ceilings and upper half of the walls are placed in gloom, and yet, go where you will, you cannot avoid the glare of one or more of the lights; such an arrangement is at the same time wasteful of light and inadequate for reading. He disapproved of downward or other reflectors in general lighting, particularly the polished kind, which reflect in spots and streaks; a room is better lighted when ceilings and walls are permitted to do the reflecting.

For low ceilings the lamps should be placed as high as the proper illumination of the ceiling will admit, and the

FIG. 1.

direct light kept from the eyes by means of opaque or semi-opaque screens, in which case the lamps should not be enclosed in obscured glass. The form of these screens will depend upon circumstances, but fig. 1 is a suggestion for an average case, and may cover an arc lamp, filament lamp, incandescent gas, or a regenerative burner. By this means good general illumination may be obtained without the lights being seen. Indirect lighting is also specially suited to low ceilings, in which inverted arc lamps may be used, or ordinary bracket lights, screened from the eye level, yet arranged to illuminate the ceiling and walls, and which will give a pleasing and sufficient general light. This method of treatment is more fully explained under the head of the "Art of Shading" in *The Illuminating Engineer* of February and March, 1909.

(To be continued.)

UNIVERSITY OF LONDON LECTURES ON ARCHITECTURE.

At the British Museum on Tuesday, the subjects dealt with by Mr. Banister Fletcher were the Circular Temples and Basilicas of the Romans, both of which are of particular interest to us to-day, since the circular temple was the prototype of the early Christian baptisteries of the fourth century, and the basilica the model from which almost every Christian church and Gothic cathedral was evolved.

The worship of the goddess Vesta in Rome is of the greatest antiquity, and is supposed to have been founded by Numa the legendary second king of Rome after Romulus. Her temples were always circular on plan, symbolising the family hearth with the fire in the centre, similar, it is believed, to the Greek Prytaneum, in which the sacred fire was always carefully guarded; the origin from prehistoric times no doubt being a desire to have in every village and city one fire always burning, from which the villagers might kindle their own hearths, for, before the use of flint and steel, fire could only be obtained by the laborious process of a wooden drill, a custom still in use among certain savage tribes.

This primitive custom was resorted to with great pomp and ceremony in the event of the fire in the temple dying out, and was continued for some time after the easier methods were in common use.

Numa is said to have transferred the cult from Alba Longa to Rome, and to have instituted four vestal virgins to tend the sacred shrine. Later the number of vestals was augmented to six. These were chosen by the Senate, the office being much sought after as one conferring the highest

possible honours. The candidate had to be over six years of age and under ten. Her vows lasted for thirty years, the first ten being spent in learning her duties, the second in performing them, and the third in instructing the younger vestals.

The priestess of Vesta enjoyed many privileges and advantages, amongst others the seat of honour beside the Empress at the circus, theatre, or amphitheatre, the exceptional privilege of riding in a wheeled carriage, and the power of pardoning a prisoner condemned to death should she meet him by accident on his way to execution. On the other hand any negligence of her duties was severely punished, for she was scourged if she allowed the fire to go out, the relighting of which was performed by the Pontifex Maximus in the manner already described, or by means of a burning glass, or concave mirror in later times.

Once a year the fire was solemnly extinguished on March 1, and rekindled by the Pontifex. A similar custom, probably a survival of this pagan rite, still exists in the Church of Rome to-day, when on Holy Saturday, all lights having previously been extinguished, the priest kindles fire by means of a flint, and proceeds to light the Pascal candle.

The Temple of Vesta was destroyed by fire four times, the last time being in 191 A.D., after which it was rebuilt by Severus. The existing podium of concrete, about 10 feet high, belongs to the earlier structures, the foundation of the steps even possibly to the original temple. The circular temple had a peristyle of eighteen columns of the Corinthian Order. The frieze was ornamented with ox skulls and sacrificial ornaments, and the ceiling of the peristyle was coffered.

It is usually held that these circular temples, and those of the Greeks had, as it were, two roofs, the dome of the cella being slightly above the level of the peristyle roof, though a coin of the time of Vespasian, probably struck to commemorate the restoration of the Temple of Vesta after the great fire in Nero's reign clearly shows one dome covering alike peristyle and cella.

The Temple of Mater Matuta and the little Temple of Vesta at Tivoli were mentioned, the capitals of the latter having been copied by Sir John Soane in the Bank of England.

The Pantheon was built upon the site of a former nymphæum, a place for plants, flowers, and running water. In front of the nymphæum was a temple built by Agrippa during the reign of Augustus in the year 27 B.C. This temple was of the Etruscan type, having three cellæ, as seen by the spacing of the columns of its decastyle portico.

In the year 120 A.D., Hadrian built the Pantheon over the nymphæum, using the portico of the Etruscan temple, making it face north instead of south, also converting it into an octastyle instead of a decastyle structure, thus accounting for the steeper slope of the pediment, and the want of verticality in the consoles of the raking cornice. For many years the inscription in the frieze bearing Agrippa's name was most misleading, and it was not until the investigations made by M. Chedanne in 1892, when amongst other discoveries he found bricks stamped with the name of a brickmaker of Hadrian's time, that the real date of the building was known. It was thought at one time to have belonged to the Thermæ of Agrippa, but as no hypocausts were found under its floors, and no openings or means of communication with the baths could be traced in its concrete walls at the back of the building, this theory was abandoned.

The columns of the portico are monoliths of granite (the earliest existing examples of granite columns in Rome); they are consequently unfluted, but have Corinthian capitals of Pentelic marble. The columns are 46 feet in height, having a diameter of 5 feet at the base.

The Greeks were averse to the use of the monolithic shaft, with rare exceptions, as it was more liable to split; they preferred to build up their columns in drums in order that the stone might lie the right way of the grain; but the monolith found great favour with the Romans. The portico measures 110 feet across by 55 feet, and has three columns in its depth. The Temple probably derived its name from its dedication to the various deities of the Gens Julia, or it is thought from its resemblance to the Vault of Heaven.

We owe its present preservation to the fact that the tyrant Phocas presented the building to Pope Boniface IV., who consecrated it as a church under the title of S. Maria ad Martyres.

The temple is circular on plan, its walls of concrete being 20 feet thick; there are eight recesses in the thickness of the wall, one forming the entrance. Three are semicircular and the remaining four are rectangular. Between the eight recesses are smaller semi-circular chambers with openings in

GRAINGER'S PORCH
ELY

From a Drawing by "SANS PEUR."

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

This shows Grainger's Porch, Ely, being an entrance from the High Street into the Cathedral Close. The beams are all of oak, richly carved, with the coat of arms of the monastery painted on one of them. Seen on a sunny day, the russet-coloured tiles and deep shadows produce a truly picturesque effect.

the outer wall; probably these chambers are in order to lessen the weight of the wall, and also to admit the air to help the setting of the concrete; they occur on the ground level and high up. The building is 142 feet 6 inches in diameter, and measures the same from the floor to the top of the dome. The floor, which is paved with slabs and roundels of porphyry, rosso and giallo antico, &c., is slightly convex in order to avoid a hollow appearance in the centre.

In 1892 owing to cracks in the vault, M. Chedanne removed some of the stucco, and investigations proved the vault to be constructed of bricks, laid almost horizontally, sloping slightly outwards. Relieving arches of considerable dimensions and vertical piers were found in the lower portion of the dome, carrying the weight downwards. Externally this lower portion was stepped in order to prevent any tendency to push outwards. Five rows of coffers considerably lessen the weight of the dome; these lacunaria differ at the top and bottom, being larger at the bottom, in order to rectify any optical illusion, and appear to be square from below. Gilded bronze flowers were formerly attached to each sinking. At the point where the coffering ceases the dome measures 80 feet across.

The whole building is lit by one large hypæthral opening measuring 27 feet across. Holes in the floor beneath the opening carry off the rain water from the interior; these holes communicate with the Cloaca Maxima. The bronze doors are still preserved, they have fluted pilasters on either side of the panelling; the pilasters have Tuscan capitals with egg and tongue mouldings. They resemble in treatment the bronze doors of the Temple of Romulus and those of the Curia.

Internally the building is richly lined with marble, the

capitals of the columns originally having been covered with Syracusan bronze. Externally the concrete of the Rotunda was faced with brick, which in its turn was hidden by marble slabs up to the first string course; these slabs were 5½ inches thick, above this the brick was hidden by stucco. The seeming "relieving" arches of brick facing as now exposed had no structural significance, since the body of the wall was of solid concrete.

The circular temples of Baalbec, Spalato, and Minerva Medica were also described.

There were two types of basilicas or halls of justice, the wooden roofed type and the vaulted type. The Basilica of Trajan belonged to the former, that of Constantine to the latter. The basilica consisted usually of a nave and aisles, or two aisles, with semi-circular exedrae at either end of the nave, in which the prætor and assessors sat to administer justice; the prætor in the centre. The aisles frequently had galleries above, light usually being admitted by the clerestory. An opportunity for dwelling more in detail on the basilicas which were explained in the lecture will no doubt be afforded in dealing with the early Christian churches later on.

ACTION RE ARCHITECTS' CERTIFICATE.

MR. JUSTICE SCRUTTON, in the King's Bench Division on January 21, heard an action concerning a claim for 57½, balance of an amount certified by two certificates of Messrs. Bingham & Broughton, architects. That was in regard to work done at 396 Brockley Road. The

plaintiffs were Messrs. Bliss Bros., of 300 Brockley Road, and the defendant was the building owner, Mrs. Bond, at whose premises, 396 Brockley Road, the work was done. She presented a counter-claim, alleging breach of contract in that the work had been faultily done by Messrs. Bliss and was uncompleted.

Mr. Justice Scrutton decided in favour of the plaintiffs concerning various legal points. He held, amongst other things, that the architects had jurisdiction to issue a second certificate, although before it had been issued there was a dispute between the building owner and the builders. He did not give formally judgment for the plaintiffs, having regard to the question of the counterclaim, which was not determined. It was agreed that the counterclaim should go to an independent expert, Mr. G. Dunsmore, of Honor Oak Park, in the event of his willingness to act, and he (his Lordship) directed Mr. Dunsmore to report his several findings to him. Mr. Dunsmore must consider amongst other things whether any deviations from the specifications—if any—had been authorised by the architects, and whether these were legitimate variations.

ENGINEERING PLANT IN INSTITUTIONS.*

(Continued from last week.)

THE second type needs little description, and merely consists of tubes in which exhaust steam is condensed, after being passed through a grease separator, heating the water in the outer jacket. This type should be used where no grease filtration plant exists, and the greasy condense water turned to the drain.

Feed Pumps.—It is particularly difficult to be brief on this subject. The variety of choice in feed pumps leaves nothing to be desired. There is the horizontal type of single-cylinder, double-acting, vertical single-cylinder and compound, horizontal and vertical duplex pumps and ram pumps, not to mention sundry flywheel donkey pumps, and various types of injectors.

Each type has its advocates and users, and improvements are still coming in where it was thought perfection existed before. For a long time the reproach of lost motion lay against the duplex pump, but even yet, though this has been overcome, there is still the two-to-one chance of breakdown.

Whatever type is used, however, slow piston speed is absolutely essential. It is a good practice also to omit air vessels and snifting valves from feed pumps, and where these are supplied the writer always makes a practice of having them removed.

Steam Piping Installation.—On the face of it there would seem to be no simpler proposition than to connect up to the steam boiler, and run a pipe line to supply the various points requiring steam; but upon this subject alone it would be possible to wander off into quite a long dissertation. But here again, it is not the writer's intention to do more than indicate the points which should govern the successful design of a steam piping system. Steam pipes should be neither too large nor too small. They should not be too large on account of the resulting increased coal consumption. The heat loss from a single square foot of uncovered steam-pipe surface is equal to $\frac{1}{2}$ lb. of steam condensed per hour, and there can be no possible justification whatsoever, either in point of capital cost or working cost, for the use of, say, a 4-inch diameter steam pipe where a 3-inch pipe only is necessary. The surface of the former is 0.34 times greater than the latter, and the annual loss in terms of cash would approximate 1s. more per lineal foot of uncovered pipe than it need be, merely due to the difference in size, figuring on the price of coal at 20s. per ton, and a boiler efficiency of 70 per cent.

The principle of arriving at the size of steam pipes is based upon the velocity of the flow of steam, and the maintenance of a given pressure at the end of the pipe line. The whole process of calculation is an exceedingly interesting one, but far too lengthy to be entered upon here; but put briefly, the point to be decided is whether the steam is required for its heat or its pressure. For power purposes the loss of pressure due to the flow of steam is generally fixed at 1 lb. per 100 lineal feet of steam pipe, but for purely heat purposes the permissible pressure loss may be much more than this. Thus, to deliver 1,200 lbs. of steam per hour a distance of 800 feet to run a steam engine, would require a

3-inch pipe, assuming that a drop in pressure of not more than 4 lbs. were to be allowed and based upon a velocity of 7,000 feet per minute. Reducing this pipe to $2\frac{1}{2}$ inches would have the effect of doubling the pressure drop, but whereas this, perhaps, would not be allowed in the case of an engine supply where the steam is converted into work, it makes not the slightest difference when the steam is required only for its heat.

The matters which require special consideration in the running of a steam main are efficient drainage of the water, and adequate provision for the lineal expansion of the metal due to the heat.

Water in the steam main is undesirable, for two principal reasons. Firstly, it has the effect of condensing more steam, and is thus wasteful. Secondly, it may become a source of trouble and annoyance by producing the condition known as water hammer. Water occurs in the steam main by "priming" over from the boiler being carried out in a spray, owing to the steam leaving the boiler at too high velocity, and by condensation of the steam in the pipe by heat losses from the surface, and by giving up its heat to the priming water. The prevention of the first condition has already been touched upon, and the writer regards it good practice to make the boiler coupling pipes large, so that the steam may leave the boiler at a low velocity, which may be increased, as already mentioned, for the delivery mains and service pipes.

Many engineers pin their faith to steam dryers for the purpose of ridding the steam of priming water, but obviously the best practice is to prevent priming altogether, as far as possible, rather than separate the water from the wet steam after it is carried over.

Steam dryers or water separators, are fitted direct in the pipe line, and are of two types: (1) Where the wet steam is carried into a chamber fitted with a helix, or screw, to give the current of steam a whirling motion, which has the effect of throwing off the water which is being carried along by the velocity of the steam, in a tangential direction, and depositing it on the sides of the chamber, when it trickles down the sides to the bottom of the chamber, from which it is drained through a steam trap. (2) The other type of separator consists fundamentally of a large swelling in the steam main. As the priming water is only carried in the steam current by virtue of its velocity, and since the velocity is inversely proportional to the area of the passage, upon the velocity receiving a sudden check, the last-named type drops the water carried by the steam. Depositing plates are fixed in some with vanes, or perforations, to assist the action, and the steam passes on its way, usually in an upward direction, leaving the water behind; or perhaps it should be rather said that it is supposed to do so. While some are efficient, in many others—unless kept thoroughly and quickly drained—some of the water is picked up again.

In order to arrest the condensed water, which travels along the pipe, pockets should be formed at intervals to catch the condense water. An exceedingly good method of draining the steam main is by forming relay drains at convenient points, and by building this relay fitting into the wall it serves the double purpose of a drain and an anchorage to take the expansion thrust, and the water is drained from the pocket through a steam trap.

The popular definition of a steam trap is an appliance for draining off water from steam pipes without allowing any steam to escape. This, of course, is as it should be, but is not always true in practice. Traps are constructed on two principles, namely—the expansion of solids or liquids by heat, and by syphonic action. There is no question whatever which type is the more economical trap from a heat point of view. Expansion traps eject the water almost as soon as it is formed, with the result that in the case of condensation from high-pressure steam the high temperature water bursts into steam, on being liberated into the atmosphere, and a large proportion of its heat is thus lost. This type of trap is also more suitable for use with high-pressure steam than for low pressure, although many forms are made to work with low-pressure steam.

If an expansion trap draining a high-pressure steam pipe is fixed in the vicinity of a low pressure steam main the condensation water may be discharged into it, instead of to atmosphere, or to a condense main, where the heat is lost; and since condensation water, from 120 lbs. per square inch steam, when discharged into a 5 lbs. per square inch steam main, gives off 10 per cent. of its heat in steam, the economy may or may not be worth while.

Almost any steam trap may be made to lift the water of condensation to a reasonable height, in relation to the steam pressure (always providing the body of the trap is sufficiently strong to resist the steam pressure), by the simple

* A paper read before the Association of Engineers-in-Charge on January 11 by Alfred E. Wheeler (Prize Medallist, R.San.I.).

process of fitting the outlet of the trap with a non-return valve.

One of the most troublesome problems offered in steam practice is that of expansion of the pipes. A frequent question put by one engineer to another is: Which is the best type of expansion joint? The writer's opinion is that they are all an unmitigated nuisance, and things to be avoided. Those of the packed gland type refuse to move at the psychological moment—usually at contraction—with the result that the pipe line breaks. The copper loop type are not much better, and usually find a weak spot to expand on, where they finally break.

The operation of brazing the flange also often upsets the most carefully annealed metal, and in addition, also if they are not frequently removed and annealed, the copper hardens and cracks. Perhaps the best practice is to go out of one's way to avoid them altogether. This can often be done by changing the direction of the main at right angles to its length, in mid-position between two anchored points, and if the piping is of cast iron the bends on these turns should be made in steel.

Where this cannot be done then, perhaps a good gland joint, constructed entirely of cast iron, treated with the "Bower-Barff" process, is best, the gland round the sliding sleeve being packed with a graphite packing. Frequently, from motives of making a "good job," packed joints are used with gun-metal sleeves working into a cast iron body, forgetful of the fact that the co-efficient of expansion of the gun-metal is greater than that of the iron, which in itself is conducive to such binding.

Whatever type is used due care must be taken to "fix" the steam pipe in suitable positions in relation to the expansion joint, to ensure the expansion taking place regularly.

After the steam plant and its distributing system, the steam-using appliances naturally follow, the principal of which are calorifiers for heating water for the purpose of supplying radiators for warming the buildings, and for hot-water supply for baths and taps, kitchen apparatus and laundry apparatus.

As the steam pressures for these different purposes vary somewhat we may consider the point a few moments. In the condensation of steam only the latent heat is employed, the water of condensation returning practically to its original boiling point. Since the latent heat of low-pressure steam is greater than that of high-pressure steam, it is obviously more economical to use low-pressure steam than high-pressure. The important point to be here noted, however, is that this is only true where the steam is generated at the low pressure. When the steam pressure is reduced by a reducing valve this is not correct, as the steam expands to the lower pressure at little less than the temperature of the high-pressure steam from which it is reduced, the low-pressure steam being superheated to the extent of the difference in the temperature.

Although it is on the side of economy to heat water with low-pressure steam, the calorifiers require to be considerably larger than with high pressure, and a calorifier using steam at 50 lbs. per square inch pressure will perform nearly twice the duty of another of the same size using steam at 5 lbs. per square inch pressure.

Steam pressure for kitchen purposes is not so important as temperature, and for considerations of safety this should not exceed 10 lbs. per square inch. For laundry purposes at least two pressures are required; a general pressure for washing machines, boiling, &c., of 10 lbs. to 15 lbs. per square inch, and a pressure of 40 lbs. per square inch for ironing machine beds, where these are steam-heated. A third and higher pressure is necessary when the laundry is steam-driven, which is most economical, since the exhaust steam may be re-used in the drying-room heaters.

In all these cases the steam is carried to the point required at the highest pressure, and reduced to the required pressure by reducing valves. These valves are so constructed that the low-pressure steam, acting on a diaphragm, piston, or through a water column over a given area, will close the valve against the high pressure when the given low pressure is reached. As the whole successful working of this valve depends upon its ability to remain tight against the high-pressure steam, care should be taken to avoid scoring of the seat, which is so common a feature with steam valves which are frequently raised "just off the seat." With this in mind it is always best to have the valve too small rather than too large, as a shortage of low-pressure steam causes the valve to open wide and prevent scoring. The only disadvantage in the valve being small is the high velocity, which causes the steam to "whistle."

(To be continued.)

MANCHESTER SOCIETY OF ARCHITECTS.

ON Wednesday, the 25th inst., a lecture was given by Mr. J. L. Ball, Professor of Architecture at the Birmingham University.

After a brief introduction indicating the necessity for the study of ancient architecture, and suggesting some methods of study, Mr. Ball proceeded to give a general account of the three East Anglian cathedrals of Peterborough, Ely, and Norwich, pointing out the close resemblance which originally existed between them, their characteristics as Romanesque minsters, and the changes which have taken place in them in later times. Then, turning aside from questions of archaeology, the architecture of the three cathedrals became the subject of discussion, and the opinion was expressed that here, at any rate, the architecture of the twelfth century is supreme in all purely architectural qualities; attention being specially directed to the expression in it of the sense of power. Nor is this expression of power merely crude and uncouth, but the work of deliberate and expert artists, marked by maturity of style and refinement of proportion. The nature of proportion in architecture is next discussed at some length and illustrated from these cathedrals, whose architecture is so sparing of decorative accessories, where we feel, as we seldom can, how little architecture need rely on ornamental details, how much on proportion. Some of these proportions are then noted and compared, particularly the great galleries, the division of the internal height into three nearly equal parts; a notable characteristic of this group of cathedrals which connects them with Winchester, Cerisy, and l'Abbaye aux Hommes.

He then proceeded to a consideration of the exterior architecture of the three cathedrals, noting a certain inferiority to the interior, the difficulty in all architecture in the grand manner of binding together interior and exterior in organic unity. Nevertheless, certain fine qualities are noted in the exteriors, and it was pointed out that both in the Romanesque and Gothic periods the resources of mediæval art were concentrated on the west fronts. The only west front of Romanesque work in the three cathedrals is that of Ely, and this was described. Passing on to the west front of Peterborough, the opinion was hazarded that we have here a Romanesque design translated into the new Gothic manner of the thirteenth century.

These west fronts suggest the principle of frontal design, what Professor Loewy calls the "Law of Frontality," the law of design by virtue of which an object is always conceived in its broadest and most comprehensive aspect.

The lecturer proceeded to consider this law in its relation to architecture and also the corollary to it, called the Law of Approach, showing that in these laws we obtain a glimpse into the method of Romanesque and later Gothic design.

Mr. Ball then analysed the principles of Romanesque design as exemplified in the East Anglian cathedrals, pointing out that the Romanesque architects were essentially arch-builders, using arcading not only for structural reasons but for the purposes of art. Attention is directed to the æsthetic value of the semi-circular arch in the sequence of arcades, to the solution of the problem of stability by massive supports without the aid of buttresses, and to other points in the architectural expression of arched construction suggested by a study of this group of cathedrals. The question was asked whether it is possible to detect the peculiar quality in the work of the twelfth century which marks it off from other arched construction, and the answer was found in the expression of flexibility, of the elasticity of structure; and it was shown in what way this expression of flexibility is obtained, the explanation being based on the circumstances under which Romanesque architecture was done and the conditions of building wholly unlike those of the present day.

Similar reflections on the circumstances of ancient building were next shown to afford some clue to many of the puzzling irregularities in it, and the question of the time actually spent in building a cathedral was fully discussed.

The name "Norman" often applied to Romanesque art in England brings up the whole subject of the local schools of Romanesque, their diversities, and the essential unity of idea which gives to Romanesque architecture everywhere its distinctive character. The paper went on to describe the main purpose of Romanesque from the time when it first emerges from the Roman basilica, its purpose as essentially ecclesiastical art, and as expressing the Catholic ideal.

In these cathedrals of the twelfth century we see Romanesque architecture in the maturity of its genius, and thus, without any period of decadence, it passed. The most valuable lesson we can learn from these great works is not to attempt to reproduce them.

MODERN EUROPEAN ARCHITECTURE.
GERMANY.[From *Dekorative Kunst*.

COMBINED CHURCH AND FLATS, NASSAU STREET, BERLIN.—Herr HEINRICH STRAUMER, Architect.

OUR CONTEMPORARIES FROM OVERSEAS.

THE *American Architect* (New York) devotes the whole of its principal illustrations to a beautiful series of photographic views of the garden at Pocantico Hills, New York, the estate of John D. Rockefeller, Esq., of which Mr. William Welles Bosworth is the architect. There is also a leading article with further illustrations in the text describing the gardens.

La Construction Moderne (Paris) illustrates further examples of the Parisian prize façades of 1909, No. 82 Rue

Saint Lazare, by Mons. Jarlat; No. 83 Avenue Henri Martin, by Mons. Stoullig; and No. 42 Cours-la-Reine and Place de l'Alma, by MM. Naville and Chauquet. Two prize designs in the competition for the Godebœuf prize at the Ecole des Beaux-Arts are also given.

Berliner Architekturwelt (Berlin) has this month a very excellent number containing a full series of views of the Brandenburg Assurance Institution, of which Herr Hermann Rohade is the architect; the Paul Gerhardt Church at Schöneberg, by Herr Fr. Schultze; the Schloss Königs-

waldau, by Herren Dinklage, Paulus, and Lillöe; and some examples of Berlin street façades and modern German sculpture.

Moderne Bauformen (Stuttgart) gives most of its space to two houses by Professor Wilhelm Kreis, of Düsseldorf, very thoroughly carried out even to the furniture from the architect's designs, and hence thoroughly harmonious. An excellent school at Zürich is also illustrated, of which the brothers Pfister are the architects.

The *Architectural Record* (New York) for this month is a monograph of the ecclesiastical work of Messrs. Cram, Goodhue & Ferguson, with a few examples of their secular and miscellaneous buildings added.

Construction (Toronto) makes a special feature of "Types of Pacific Coast Houses," including examples from British Columbia and Southern California, which show the development of the bungalow type of house. Other illustrated articles deal with the new municipal buildings of New York City and the restoration of the Campanile at Venice.

NOTTINGHAM ARCHITECTURAL SOCIETY.

THE third meeting of the Designing Club connected with this Society was held on Tuesday, January 17.

The subject set for competition was a design for a small detached house in a garden city.

Six designs were sent in, and were criticised by Mr. E. H. Heazell, who had drawn up the conditions.

A discussion took place, at the close of which Mr. Heazell was thanked for his kindness in preparing the subject and giving such an interesting criticism.

The meetings of the Designing Club are being well attended, not only by those who compete, but by the older members, who attend when possible, and by their kindly criticisms and hints help to make these meetings useful to all.

[The Editor will not be responsible for the opinions expressed by Correspondents.]

Proposed House at Chesham.

SIR,—In regard to the interesting house illustrated in the current issue, and so reminiscent of Mr. Ernest Newton both in planning and elevations, it is to be regretted that such liberties of draughtsmanship should be taken, with the view apparently of improving the perspective sketch. To transfer the south-west flank in plan to show as the north-east flank in perspective, and to transpose *en revers* in regard to the terrace boundary wall is scarcely to be justified. It is such manoeuvring as this that causes many architects to deprecate the admission of competition perspectives. Why could not Mr. Stanton have shown a left-hand flank in perspective, and thus avoided misrepresentation?—Faithfully yours,

PERCY L. MARKS.

Albert Buildings, 49 Queen Victoria Street, E.C.
January 23, 1911.

Petrol Air-Gas.

SIR,—Mr. Key's letter in your last issue raises a question which I have not seen mentioned before, viz., the relation between the expressions "per cent. mixture" and "cubic feet per gallon" when used to designate the same gas. Obviously Mr. Key finds himself in trouble over this relationship, and it is probable that others experience the same difficulty. I notice also that Prof. Smith has not touched upon this point, so that the following remarks may not be out of place.

From the fact that 100 volumes of air at 50° Fahr. absorb 17.5 per cent. vapour of spirit of sp. gr. 0.650, Mr. Key makes the startling statement that this is equivalent to 580 cubic feet to the gallon. The intermediate mental step, which unfortunately he omits, would be interesting.

To calculate the number of feet to the gallon of any percentage mixture we must have another factor besides that of the sp. gr. of the liquid, viz., the number of cubic feet to the gallon of saturated vapour the liquid yields upon evaporation. This one can calculate for pure substances as follows:—

The gram molecular weight of any substance in the gaseous form at 0°C. and 760 mm. occupies 22.4 litres, or

in English measures the molecular weight in lbs. occupies 359 cubic feet. From this we have that for hexane (C_6H_{14}) sp. gr. 0.663. 86 lbs. occupy 359 cubic feet, whence

$$1 \text{ gallon occupies } \frac{359 \times 6.63}{86} = 27.7 \text{ cubic feet.}$$

Similar calculations for the hydrocarbons in the petrols used for lighting purposes give the following table:—

Pentane	sp. gr. 0.626	gives	31.2	cubic feet	per	gallon.
Hexane	" 0.663	"	27.7	"	"	"
Heptane	" 0.688	"	24.7	"	"	"
Octane	" 0.719	"	22.6	"	"	"
Nonane	" 0.741	"	20.8	"	"	"

and if we plot a curve from this data we can read off the cubic feet per gallon corresponding to any sp. gr., as the fact that any petrol is a mixture of several of these hydrocarbons cannot influence the result to any appreciable extent.

Taking the case in point of a 17.5 per cent. gas from petrol of 0.65 sp. gr. we see from the curve that this spirit gives 28.5 cubic feet per gallon, hence this 17.5 per cent. gas represents

$$\frac{28.5 \times 100}{17.5} = 163 \text{ cubic feet of gas per gallon,}$$

and not the amazing figure given by your correspondent.

The test he says he witnessed, in which 0.715 spirit gave 190 cubic feet of vapour, is so extraordinary as to be hardly credible, as one would expect it to give only 23 cubic feet at 0° C. and 760 mm. No temperature correction could expand it to this figure, and it looks to me as if he were mixing up air saturated with vapour and vapour only.

Examining the statement about which he is sceptical, viz., that with 0.720 Shell spirit 1,840 cubic feet of gas per gallon is a 1½ per cent. mixture, this works out from curve to be 1.24 per cent. A 1.5 per cent. gas should be 1,500 feet to the gallon. The plant, the makers of which give these figures, employs a self-burning mixture, and this is necessarily explosive.

I am sorry to see that Mr. Key is worried at Professor Smith recognising his "nine-chambered turbine" as "a kind of reversed gas meter." From the drawings supplied I should have been inclined to agree with Professor Smith, but I have seen no accurate definition of the word "turbine," and it may be elastic enough to cover even "a reversed gas meter."—Yours faithfully,

E. SCOTT-SNELL.

Walton-on-Thames: January 23, 1911.

SIR,—I would like to congratulate you on your recent series of articles on petrol air-gas. I consider them invaluable, and I have (with the correspondence which has appeared on the subject) made a small booklet, which I intend to keep for reference. I was interested in the series on Refrigeration, which I have also kept, but, unfortunately, there were, in my opinion, too many chapters. If not too late, may I suggest to "Inquirer," under the heading of "Thin Walls and Piano-playing," that he should get into communication with A. L. Gibson & Co., of Strawberry Vale, Twickenham, and ask for particulars of their Cabot Quilt for deadening sound.—Yours, &c.,

A COUNTRY ARCHITECT.

Planning of a Town.

SIR,—Referring to your article on "The Planning of a Town" in your issue of the 13th inst., perhaps you will allow me to point out that the village of Bournville is not owned by Messrs. Cadbury Bros., nor was it built for the accommodation of their workpeople. It was founded by Mr. G. Cadbury with the object of providing homes in rural surroundings for men employed in factories or similar indoor occupations in Birmingham and neighbourhood, the desire being to try the effect of good houses and country life upon the men and their families. Ten years ago the village was handed over by Mr. Cadbury to trustees, who now administer it. The deed of foundation provides that the total revenue from the village and estate shall come into the hands of trustees; and be used by them for the extension of the scheme; the trustees are thus an entirely independent body, and administer the property in the interests of the nation. The result thus far, whether judged by the demand for houses, the health of the population, or the way in which the gardens are cared for, is entirely satisfactory.—Yours truly,

JOHN H. BARLOW, Secretary.

Bournville Village Trust, Bournville, near Birmingham.
Estate Office, Bournville, near Birmingham.

THE RESPONSIBILITY OF ARCHITECTS.

THE responsibility of an architect for the strict carrying out of his plans and specifications is too often scarcely realised by the young practitioner, and very frequently overlooked by architects who can no longer be called young. Fortunately, in most cases things go fairly smoothly and the architect is able, at his occasional visits to the works in progress, to detect any flagrant deviation from the contract.

But the detection of flagrant deviations on occasional visits by no means satisfies the legal obligation of the architect to his client. Lawyers and the general public in a very large degree look upon architects as policemen and detectives, who will protect them from the wrong-doing, whether by ignorance or intention, of the builder and his workmen, who are the actual executants of the contract to build a certain structure.

Of this attitude the case of the Leicester Board of Guardians *v.* TROLLOPE, which we reported last week, is the latest example, and the unfortunate architect is saddled with the responsibility of making good damages of between 2,000*l.* and 3,000*l.* to a building erected from his plans and specification, besides the cost of an expensive law suit.

In this particular case it was made clear at the trial of the action that the clerk of the works did not ensure the carrying out of the work in accordance with the specification, nor did he, so far as appears from the evidence, call the attention of the architect to a departure from the contract. It is obviously impossible for an architect, unless he is on the building during the whole time that workmen are there, to see that all the work is being properly done, and in a building of any size, such as the very large infirmary built by the Leicester Board of Guardians, would the constant attendance of the architect himself ensure the absolutely faithful execution by every workman of every piece of work in the building?

But no architect does or can spend all his time on a building during its erection, and he must therefore depend upon the ability and the honesty of someone else to act as clerk of works and see that every stone and brick, every piece of timber, every yard of concrete, is in accordance with the specification. If the clerk of works, through incompetence, inattention, or intent, permits a deviation from the contract and trouble ensues, so that the employer suffers damage, the architect, and not the clerk of works, is responsible for that damage. This is the law.

In the case to which we have referred it was distinctly suggested by counsel for the plaintiffs that it was the duty of the architect to check the clerk of works. If the architect is to check the clerk of works, what is the use of this official? The only reason for the employment of a clerk

of works is that he may do for the architect what the architect is physically incapable of doing for himself, by exercising the constant supervision necessary to ensure the exact fulfilment of the contract.

Are the public prepared to pay for constant supervision by the architect himself, so that no architect shall be engaged on more than one building at a time, and when he has made his drawings and specification and building operations commence he shall transfer himself to the job and check everybody and everything until the completion? It might be a good thing for architecture and for architects if such a remodelling of our modern methods came to pass, but we do not think there is much likelihood of such a thing happening. The architect would be in closer touch with the craftsman, he would know and control his building from start to finish in a far more thorough manner than he does now, he might even take a hand in personal labour on the actual materials. But are the public prepared to pay three guineas a day to an architect for doing what is now supposed to be done by a clerk of works at three guineas a week?

If the public are not prepared to pay for the architect's constant attendance on the building is it right that they should expect the same minute supervision as if they did pay? Yet that is what the decision in the case of Leicester Board of Guardians *v.* TROLLOPE comes to.

When the Royal Institute of British Architects formulates the revised Schedule of Charges it seems to us that provision must be made for dealing with the conditions of an architect's responsibility as now recognised by the law. The hitherto customary 5 per cent. does not give a sufficient payment to the architect for the minute supervision for which he is legally responsible, and any attempt to continue payment on that basis makes architectural practice a gamble in which the architect stakes his reputation and his fortune on the ability and integrity of a clerk of works, whom he is expected to check. Engineering works of any magnitude have one or more resident engineers, and architectural work must be so well remunerated as to provide for the payment of a resident architect. We are aware that to some extent and *sub rosa* architects in large and widely distributed practice employ local colleagues or assistants from their own office to supply a greater amount of supervision than the titular and original designer can afford to give. But in the ordinary way 5 per cent. does not cover the expense of such an arrangement, and the responsibility is still existent.

We have hitherto spoken of works of sufficient size to justify the employment of a clerk of works, but the architect is still legally liable for all sins of omission or

commission by the builder in small affairs, and we know of instances where architects have been called upon to pay, and have paid, for non-compliance with the terms of a building contract resulting in loss to the employer, even when no clerk of works has been employed. This is particularly hard upon those architects, often young architects, who must be content to carry out small jobs, often at a considerable distance from their office. If an architect visits a job once a week he is giving quite as much attention as can possibly be expected, and more than he can often spare, and an ignorant or dishonest workman can do a great deal of mischief in a week.

Thus it is vitally important that the Institute Schedule of Charges should clearly define the extent of the supervision for which the ordinary fees are the proper remuneration. If the public require more than this, they must be prepared to pay for the additional security, and the Schedule of Charges must make provision for this.

It must not be forgotten in a discussion of the responsibility of architects that this is not limited to supervision of the performance of a contract. The architect is also liable for an improper performance of his duties in the preparation of the drawings and specification that form the basis of the contract. Dry rot was the trouble at Leicester Infirmary. If the architect's drawings and specification do not provide for security against dry rot, or, at any rate, entail such methods of construction as may probably lead to dry rot, he would be just as much liable for damages as if the mischief arose from insufficient supervision. If the construction shown on his drawings is insufficiently strong he is also liable, even to the extent of a criminal charge of manslaughter, should someone be killed in consequence of faulty design. With this aspect of the question no reasonable and qualified architect would, of course, quarrel, but it is well that the liability should be recognised by young practitioners who rush into practice before they are sufficiently educated. An architect is paid for the exercise of skill. If he does not possess the skill, or does not exercise it, he is liable for damages.

NOTES AND COMMENTS.

WE offer our congratulations to Mr. ERNEST NEWTON on his election to the Associateship of the Royal Academy. It cannot be said that this recognition comes too soon to one who has done so much to maintain the high standard of modern English domestic architecture and who has so

worthily followed in the footsteps of his master, Mr. NORMAN SHAW, whose first pupil he was.

THE President of the Royal Institute, Mr. LEONARD STOKES, in a letter to the *Times*, has, with his usual directness, made an excellent suggestion for expediting the completion of the connection of the Mall and Charing Cross, so that it may be ready for use as the processional road at the Coronation. Let the Government and the London County Council drop their fencing match (which, we admit, is pretty play, but somewhat tedious) and hand over the job to the Mansion House King Edward Memorial Committee, who, as Sir R. M. BEACHCROFT suggested, might provide the balance of the funds necessary. Mr. STOKES proposes that the First Commissioner of Works, the Chairman of the London County Council, and the Mayor of Westminster should form the nucleus of a sub-committee, with the Lord Mayor as Chairman, to settle the matter. We hope Mr. STOKES will not press his scheme (or is it Professor PITE's?) of a double circus arrangement as the desirable method of finishing the processional road.

THE statement which has been going the round of the Press that Mr. I. C. JOHNSON, the centenarian, was the inventor of Portland cement is not quite correct, although he must be regarded as one of the pioneers of modern manufacture in the material by the improvements he introduced in the burning. As a smart business man he also introduced cement factories where no chalk exists by taking advantage of the discarded chalk thrown out from ships sailing light in ballast.

THE case of CARMICHAEL *v.* Stonwood Patent Fire-proof Flooring Company, reported in the *Times* of Monday last, contains a warning lesson to architects who have to decide between contractors and sub-contractors in case of dispute. The defendants are said to have guaranteed certain flooring laid by them for the contractor "for a period of three years, fair wear and tear excepted, and that if the flooring proved unsatisfactory to the building owner the defendants were to refund to the plaintiff the money paid by him to them for laying the flooring, unless the architect decided that the faults complained of were due to causes beyond the control of the defendants, the decision of the architect to be binding on both parties." The architect decided against the sub-contractors, but his decision was not upheld by the Court because, being

in the position of an arbitrator, his inquiry had not been conducted in a judicial manner and had not been followed by a properly signed award.

DISPUTES between contractors and sub-contractors are of frequent occurrence, and, usually speaking, the architect of the work is the best man to decide the disputes, the parties to which are generally quite content to leave the decision to him. But the architect must remember that he is, in such instances, an arbitrator, and he must conduct his arbitration and make his award in a proper manner.

THE *Art Journal* for this month contains an article on Gatton Park, some few of the illustrations to which are of architectural features, but the majority of the natural beauties of Sir JEREMIAH COLMAN'S home. A series of papers by Mr. LUTHER HOOPER is commenced on "Art of To-day: Fine and Otherwise," the opening chapter being on "Art in the Church," the text of which is St. Christopher's Church, Haslemere, designed by Mr. CHARLES SPOONER, F.R.I.B.A., and now further adorned with fittings designed by Mr. SPOONER and hangings by Mr. HOOPER. Some of the work of GODFREY BLOUNT in "The Country Church" is also included in the illustrations. Another series of articles that promises to be interesting, on "National Character in Art" by HARRY R. MILEHAM, also commences in this number.

THE interim Executive Committee appointed in connection with the proposed Scottish national memorial to the late King EDWARD VII. have considered the four proposals put forward: 1. A memorial in Edinburgh associated with the Palace of Holyrood, in the form of a suitable memorial erected in or near the Palace grounds, as proposed in the motion of the Lord Provost of Glasgow and seconded by Lord BALFOUR OF BURLEIGH. 2. The establishment of a School of Tropical Medicine or of special clinics for cancer or consumption, as suggested by Mr. GARDEN of Troup. 3. That the memorial should take the form of a crusade against consumption, as proposed by Mr. WILLIAM YOUNGER (now Sir WILLIAM YOUNGER, Bart.), seconded by Mr. THORBURN. 4. Alternatively (a) the restoration of Linlithgow Palace as a great national museum, or (b) the establishment of a Scottish memorial library, as suggested by Lord ROSEBURY. The proposals for medical memorials were definitely negatived; Lord ROSEBURY'S scheme was supported in his absence by a letter from its proposer, but otherwise ignored; and the Holyrood scheme, for which a sketch design by Mr. R. S. LORIMER, A.R.S.A., was exhibited at the meeting, was adopted for recommendation to the General Committee. The cost is estimated by Lord Provost M'INNES SHAW at 60,000*l.*, including a certain amount of street improvement, for which it is hinted the Government might be asked to make a contribution.

In *The Antiquary* for this month an interesting paper by Mr. J. TAVENOR PERRY on "An Episode in the History of Penshurst Place" deals with the ownership of the famous old Kentish house by the PERRYS and SHELLEYS in the eighteenth century, an almost forgotten era in the history of Penshurst.

In the report of the Council of the Newcastle Society of Antiquaries the results of the explorations at Corstopitum were summarised. So far, the Excavation Committee has demonstrated that Corstopitum dated from an early period in the Roman conquest of the Tyne Valley, shared in the vicissitudes of succeeding centuries, and that its occupation continued until the very eve of the departure of the Roman troops from Britain. If the magnitude of the place and the richness of the finds at Corstopitum have called forth general interest, the simultaneous work elsewhere, that has been conducted by Mr. J. P. GIBSON and Mr. F. GERALD SIMPSON, is of great importance. Their discoveries have already added much to our knowledge of the Wall and its accessories, and those of the past year

have been of singular interest. What is described as a Roman watermill was laid bare above Haltwhistleburn fort. Mention has been made of the discovery of a mile-castle by Mr. GIBSON and Mr. SIMPSON, on the Cumberland side of Poltross Burn. Its site had been conjecturally located by Mr. GIBSON, close to the scene of comparatively recent explorations. These were carried further westward, and the work of the spade shortly uncovered the gateway. Mr. SIMPSON has since laid bare the whole interior of this mile-castle, and revealed features of special importance. Reversing the aspect of Cawfields mile-castle, this one lies on a slope facing north, with the Wall at its foot. It enclosed a series of terraced buildings intersected by a central street. These gave us, for the first time, an example where the internal arrangements of a mile-castle have remained; and by an excavation, conducted with scientific care, successive periods of occupation, destruction, and reconstruction are made manifest. It would be difficult to exaggerate the value of the work pursued by these investigators, year by year, in advancing our knowledge of the Wall and in adding to the fascination of this period of history.

TRUTH IN CRAFTSMANSHIP.*

By T. RAFFLES DAVISON.

(Official Report.)

When the dust of the workshop is still,
The dust of the workman at rest,
May some generous heart find a will
To seek and to treasure his best.

From the splendour of hopes that deceived;
From the wonders he planned to do;
From the glories so nearly achieved;
From dreams that so nearly came true;

From his struggle to rise above earth
On the pinions that could not fly;
From his sorrows; oh, seek for some worth
To remember the workman by.

If in vain; if Time sweeps all away,
And no laurel from that dust springs;
'Tis enough that a loyal heart say,
"He tried to make beautiful things."

EDEN PHILPOT.

IF you would really understand human life you will not be content to study that phase of existence which is lived by a carpenter or by an architect, by a Prime Minister or a suffragist, nor will you overlook any living type in race of men. The motives which inspire the actions of all mankind, their hopes, successes, failures, and disappointments are part of life. When we think of life as a whole, the subject appears so vast that we may well feel a profound mistrust of those who form their judgments on the facts which they alone know and understand. And a realisation of the unity which binds mankind together is the only guide to true knowledge and to all feelings of real tolerance and liberality. What is true of life is true of art. Great art is that which holds a something common to all mankind, and the outline of a Hindoo temple, of a Gothic church, or an Egyptian pyramid makes an appeal that is high above all mere particular of man or place. Thus principles which guide us to good issues in our life and work apply equally to the man of business and the architect, the carpenter and the plumber, the glass designer and the sculptor.

It is so difficult to realise that our knowledge of everything is coloured by our own personal view. How almost entirely subjective are our views of art and of life! The individuality of the person may be a great gain to art, but it has its dark side, for it fosters an ignorance of, or indifference to, the universality of things. Mill says, "Truth in the great practical concerns of life is so much a question of the reconciling and combining of opposites that very few approach to correctness."

Definition of Truth.

That which matters to all the world is Truth. You have met none who decries truth and praises falsehood. Here is a

* A lecture delivered at Carpenters' Hall, January 25. First of the series on "The Arts Connected with Building."

quality which binds all life together in one great need. Let us have truth, whatever be our work in life—emperor, statesman, merchant, painter, carpenter, plumber, or what you will. By truth, I mean a something that is large as life itself. The truth I mean is not the truth of mere verbal or written utterance, the conveyance of information for the tax collector, the father confessor, or the jury, but the truthful expression of the whole of life, our work and play, our art and business, our beliefs and thoughts. Truth is not always pleasant, not always convenient, not always easy, but it is for ever and ever the final good. I do not want to weary you with my poor expressions on so great a subject, but to make clear the point of my remarks I must say something by way of preface.

What is truth? We do not know. But we do know that in its name have been uttered and enforced nearly all the foul lies the world has known. We do know that in its name have been enacted the vilest cruelties ever conceived in past ages, and that there are exhibited to-day the most vulgar things which have ever pretended to pose as art and truth.

You may convey truth in many ways, even by facts which seem opposed to it. When the captain read over the log-book entry, "The captain was drunk to-day," the captain made a strong objection. But when a few days later he read again, "The captain was sober to-day," he found his little fault more plainly emphasised than before. Dean Alford says:—"Truth does not consist in minute accuracy of detail, but in conveying a right impression, and there are vague ways of speaking that are truer than strict facts would be." When the Psalmist said, "Rivers of water run down mine eyes, because men keep not thy law," he did not state the fact, but he stated a truth deeper than fact and truer. It is said "Truth will out." We all wish it would. Truth lies in a well. It is sunk deep under a load of tradition, and use, and perverse disguise. Does anyone know the truth about himself, his character, or even his bodily looks? To no two persons are facts the same. "The truth is, Jones is a bit of a bore," is the verdict passed by someone else on one of your most entertaining companions.

The truth about a man varies with the point of view of the poor relation, the tax collector, and the wife. It is one of the compensations of nature that we do not know what we are like. We have mirrors, but few of us realise what is our back appearance. How seldom we trouble much about the back end of buildings; the sordid cement behind the marble! But the point of view colours the truth so that we all make truth something subjective instead of objective, a something seen through our dimmed eyesight—eyesight obscured by tradition, heredity, prejudice, friendship, or hate. "Truth is one, for ever absolute, but *opinion* is truth filtered through the words, blood, and disposition." "The truth is," says a friend, and when you demur he says, "Well it's my opinion: " what a very different thing!

"Whenever a man does a thoroughly stupid thing it is always from the noblest of motives," wrote someone the other day.

Catholicity.

Is not this a good reason for cultivating a catholicity of view in art? Why should you be compelled to assume that there is no salvation in architecture but the Grand Manner, when all the time you are yearning to be a traditional Englishman with an eye for the picturesque, true to a traditional instinct for romance and poetry, and a perfect abhorrence of the cold and formal traditions of matter of fact and stately Roman art? Why should we not be ourselves? And why also should we not modify our native barbarities by the refinements of Greece and Rome, or even stimulate our love for the romantic and picturesque by Romanesque churches, German castles and French chateaux? But let us try to have good ideals that their expression may be the truth of our real selves and not mere affection. Let us try that our work may be better and our aims finer.

Desires and Deserts.

As the man is in himself so his work will be. You cannot disguise yourself in your work, and perhaps not much in your surroundings. If you are more impressed with the dignity of life than with its joyfulness, you will perhaps keep your house tidy and abolish the cat, the dog, the bird, the child, the noise, the dirt, and the disturbance. Your life may not take on so rosy a hue as that in which the joy of life is thought of most account, but it may be truer to your ideal and desire. Does not the thoughtful, practical, tidy workman score over the hasty and careless worker, and are they not both the victims of their character? It is foolish to think you can separate art from life, for as you live, so you are, and so you will act. Can we

then over-estimate the value of truth as a foundation of our character and aims?

In matters of art we may conclude that generally speaking we get our deserts. When I see a great commercial building bristling with ostentatious vulgarity I conclude that the client probably wanted it and, alas! probably likes it. When I see bicycles and monkeys and harps made up into silver brooches I conclude the ladies who will buy them have no better ideas than to like them and—perhaps—will look just as beautiful in spite of them. When a great Cardinal puts up a cathedral in an exotic style and everyone is willing to accept it I conclude it doesn't much matter, and that religion in this case is a thing above architectural association and tradition. When clients keep going to the wrong architects I conclude they are not particular about their architecture, and when the shopkeeper says he is going to give you art colours I conclude there is a demand which can be satisfied with such foolish description. If we do not aim at Truth and demand it, we must not complain if we do not get it. At any rate we might say that much of the vulgarity and fussiness in modern art is a truthful symbol of the hurry and bustle of modern life.

The Unity of Art.

May I urge one point which I think to be of supreme importance to us all? Do not let us be for ever taking such partial views of truth, and dividing things into special classes and divisions. When a child asks if Mr. Smith is a bad man we should say no, even if he has done many bad actions. No one is bad and no one is good—altogether. Men do bad things and good things, but the man you call bad does good things, and the man you call good does bad things. Everyone is an artist, writes Mr. Felix Clay, and is continually using the same feelings and motives in ordinary everyday life which have only to reach a certain degree of intensity to be labelled artistic. Because I make a mess of my arrangement and design, that may not prevent me being a very skilful carver. I may have carved a panel which in sheer dexterity has rivalled Grinling Gibbons, but the result may be a very nightmare to anyone possessed of a keen decorative sense. Grinling Gibbons was you know carried off by his own skill. He made the wood to live. Its fibre throbbed with life till imitative life ran away with art and now the imitators of the imitator are in sorry plight.

I may frame my timbers up rudely and coarsely, but I may fulfil the finest mission of design as suited to materials carrying the tension and the thrust by well adjusted impact and suitably proportioned scantling. I may produce some delightful decorative carving so as to disguise or spoil the constructional truth of my furniture. But in either case I am not wholly damned. You might as well claim that the only right expression for the leg of a chair was a solid straight piece of stuff, and that any divergence from this in outline or thickness was a departure from the necessities of Truth and therefore to be avoided. But Truth calls a halt when the departure from the constructional needs creates an appearance of weakness which endangers stability. I have known sculptors who could not draw, painters to whom perspective was a mystery, architects who could not colour and doctors who could not be considerate.

The charm of life is in its variety of endowment, and the interest of art comes from endeavours which are always partial.

The most perfect art has been shown in carved panels by men who could not by any means design the building in which to use them, and the most able architect may be one who looks with envious and appreciative eyes at the artistic work of craftsmen who realise his dreams. The humblest craftsman about a building who expresses an artistic individuality in his work stands shoulder to shoulder in the firing line of our battle against ugliness and squalor, and he is my sincere comrade with the most accomplished architect of any time.

Let us believe that art is not here and not there, on this pedestal or that, aloof and alone. It is expressed in the Indian Taj, the Greek temple, and the English home. It is a mighty chain that goes round the world, and if you are sincere about it you are adding fresh links to this golden chain by the tasks of everyday life.

The continuity and universality of art are never properly realised, any more than are the facts about life itself. You call yourself John Smith and say you are twenty-two years old, but both facts are questionable. You call yourself John Smith and to-day Wednesday, but these are only terms of convenience. And as for your age, you are really a great deal older than was the John Smith who was born in 1510, because those 400 extra years have endowed you with a knowledge, a possibility, and an age that the sixteenth century John Smith did not possess, so that at twenty-two you are much older than he was at the same age. This progress and development and this accumulation of influences are still going on, and every day of our life is

adding to them. Can you imagine the effect that the yearly rush round Europe by cultivated Americans is having on their life and their art? I have seen reproduced in an American room all the sumptuous qualities of Renaissance art—costly marble, carved wood and stone, and gorgeous metal—all imported direct from Italy, and the fireplace opening surrounded by a gauged brick arch! What an oddity, that perhaps the puritan New England instinct should crop up and hold at bay all that fine Italian art!

Essentials of Truth.

There are many truths which are very sad, many that we long to forget, as, say a South Eastern railway station. But when we speak of Truth we must not blind ourselves to what we mean. Suppose a man carrying a sheet of zinc along the street provides a subject for two painters. One of these sets forth the zinc as a beauty of light and colour which under certain conditions he really sees. The other paints it as dull dead zinc because he will uphold the truth as he knows it is. As artists both have truth before them, and if you want the truth to be plainly told, that the man is carrying a sheet of zinc, your artist who paints its reflected light and charm has given you a truthful vision as he saw it, but not the mere truth of fact, if fact you want. But if the ugly truths of fact are told by an artist in his painting he is not therefore creating beauty as a consequence. The essential truth about a Don Quixote may not be that he is making a fool of himself, but that he is wholeheartedly tilting against evil and wrong-doing. The essential truth about a Gothic cathedral may not be that it is a barbaric art (as a professor of architecture has assured me) but that it is a glorification of a religious belief which inspired craftsmen to work and nobles to spend for the furtherance of a great creed. The beauty which arose was largely by the way, instinctive, natural, and simple. The crude figures in the niches of Gothic churches were the live expression of something really felt and not pretended. Build a similar church to-day, and the thoughts that inspire it and the hands that toil on it are not likely to have that simple faith and reverence which created wonders 500 years ago.

Truth in Craftsmanship.

The Truth to express in craftsmanship may be considered in various ways. There is the truthful expression of the material so that wood may be obviously wood, and marble, iron, plaster, stone and glass each clearly seen as such. Then there is the truth of strength, endurance and suitability to position and use. We may show wood clearly as wood, but use it where it cannot and does not carry out its apparent purpose of support. We may use iron where it truthfully does its work, but disguise it as material of another sort. Truth in architectural design is continually lost sight of. We cover over iron girders with plaster and show them as though they were plaster beams, or we case them in with oak as though they were made of wood. We build up our structures with elaborate framing of steel, and face them over with a sham frontage of stone or brick—we reinforce our concrete with metal bars, and produce a material which cannot be expressed with any real truth. The simple truthfulness of brick walls and arches, of oak framing, of solid walls of stone such as we had in earlier times has to make way for the economical or safer methods of cemented fronts or cased-in steel. With the development of the iron and steel industries, the demands of insurance companies, and the general hurry and bustle of recent times, we have been obliged to ignore the claims of truth. Our shop fronts are reared above walls of glass, and our great commercial buildings represent the fullest fraud of architectural art. Our great stone columns with massive architrave and cornice are only a make-believe of something we once thought good and cannot find a substitute for; our granite columns conceal a shaft of steel, and our mighty lintels are mere slabs laid on to the girder's flange.

Truth in Design.

The Truth as to design is so diluted through opinion that the result is ludicrous. If you were to accept the dictum of one architect you would have to wipe out everything we have done since the Tudor period, whilst another would clean out all the record before the Renaissance set in. You could easily find another to wipe out the rest—if there were any! A capable critic was asked the other day which he considered the ugliest building in London, and without hesitation he answered, "St. Paul's Cathedral." I never heard of anyone who has said the same of Westminster Abbey, but I can quite believe it possible.

We are not obliged to be artistic, but we must be truthful. None of us are—completely. Let us hope we all want to be or think we are. The most elevating devotion the world has ever known has been in behalf of truth, and it should lie at the root of all our efforts in life, whether they be practical or artistic.

When we come to talk about truth in art we must try to understand what we mean. An able architect has told me that he views with complete satisfaction a beam which is composed of a steel girder cased in and hidden from view by wood or plaster, because, says he, there is no deception about it—you know the steel is inside. Well, you may say this sounds sophistical, but there are many points in building matters like this. Take the latest development of ferro-concrete. How are you to obtain a truthful and artistic expression of it in building? How can you give expression to that part which you cannot see? The metal bars or rods without which the whole would collapse can have no definite expression outside the skin of concrete with which they are clothed. Some years ago we fancied we were going to build up a lot of truth in fully displayed stanchions and girders, we were going to have great artistic pleasure in cast iron fronts, but we had to come to the conclusion that they wouldn't stand fire! There is nothing objectionable in the great girders and stanchions and brackets of an iron bridge or viaduct, if the lines of construction are considered with some definite appreciation of the beauty which may exist even in great engineering works, and often enough you may see far more beautiful results in the simple and unadorned railway bridges near a railway station than in the so-called ornamental iron roof of the station itself. You can study this comparison any day at Clapham Junction. It is easy to make basket work expressive of truth and art, or to make wrought-iron work both truthful and artistic, but ferro-concrete—well! no one has shown us yet.

Consider a solid oak post, say eight or ten inches in diameter. It will be truthful and beautiful—but it will probably split. But if we build it up in sections say in six or eight pieces placed upright and dovetailed together we get truth, in a perhaps modified form, which is far more satisfactory because it is not likely to split as would the solid round post. The framed post looks solid but isn't, the solid one looks solid until it cracks. So the appearance of truth may be better than truth itself. But there is an everlasting bed-rock of truth if we will seek it, and it is on that we ought to build.

Truth as to Materials.

But the worst of falsehoods in architectural art we always understand to be the pretence of one material being another. There is no reason why we should not aim to get the colour of a beautiful marble if only we don't pretend it is marble, and there can be no harm in using an oak stain for its excellent colour if we are not going to use artifice to make deal look like oak. Surely it is not well to pretend we are supporting a great load on a round oak pillar if it is obvious we could not do it, and that there is obviously a steel stanchion inside. In such a case we have neither truth nor the appearance of truth. Thus are we thrown back on a device like reinforced concrete, for the truth of that lies in the fact that the outer surface which we see does a necessary part in the work of construction (without which the metal would not do), and though we cannot express the metal within we must assume from our knowledge of the facts of construction that it is there.

But the truthful treatment of materials we may all realise with little thought. The false treatment of materials covers a wide range. Stone is constantly being treated as wood, pot as metal and metal as pot. Marble is treated as stone blocks instead of as slabs, cast iron as wrought, and wrought as cast. Soft stone is treated as only hard should be, and *vice versa*. Terra-cotta is treated as stone instead of as brick, cement as stone, and in some of the cleverest modern internal architectural work you will find stone forms translated into plaster. This latter is a frequent fault, and one to be much deprecated. If you cannot afford stone, but only plaster, you should have a treatment which is suited to the latter material, and which gives possibilities of beautiful and characteristic modelling. The illogical and false treatment of material is a constant and glaring evil in modern art.

Ironwork.

It may seem unnecessary to say again what has been so often said before as to the use of materials with proper thoughts of their nature and value, whether for use or art. Cast-iron, which is actually used as a term of reproach, is one of the most beautiful materials when properly employed, and there has never been any more delightful and beautiful use of it than the dainty low-relief decorative forms in which it has been produced from the designs of the late Mr. Thomas Jekyll by Messrs. Barnard, Bishops & Barnard of Norwich. It seems to me that cast-iron is needlessly under a cloud just now. Considering what it is capable of for permanent and beautiful decoration it is not half enough used.

Wrought-iron work has had many revivals in recent years, and yet one hardly knows where to go for the work of an earnest and artistic workman who supplies the public direct. How is

it that as an outcome of all the wonderful modern revival of this beautiful craft there have not sprung up in many of our villages capable artistic workmen who can earn a high wage in an independent position? We shall never get the most and best out of our materials without the fullest possible realisation of their qualities. Are not the words of a writer and thinker like Mr. Starkie Gardner on the subject of ironwork a stimulus towards this end? Hear what he says about iron: "As if to heap all its favours on a favourite child among metals, nature has specially endowed it with two extraordinary properties, wholly peculiar to itself and shared by no other metal, which enormously increase its practical value and utility. One is that an infinite number of separate pieces can be perfectly joined together into a whole without being raised to the melting point (as all other metals have to be) merely by heating and beating, without visible joints, by a process called 'welding.' The other is that its already great strength, tenacity, and hardness can be prodigiously increased or modified by tempering, repeated quenching while hot in oil or water; or still more profoundly by causing it to absorb an infinitesimal percentage of carbon into its mass, when its resisting power is increased to such an extraordinary degree as to have merited a distinct designation—steel, borrowed from a Dutch word 'staal.' The results are so important that had gold itself been needed as the alloy it must have been sacrificed. Nor have these unique properties been conferred at the expense of any others of value. Iron shares ductility, malleability, fusibility with the much more expensive metals. That is to say that everything that can be made of gold, silver, copper, tin, or lead, can also be made of iron. In fact, iron can be cast, carved, chased, hammered, rolled, pressed, punched, embossed, stamped, inlaid, polished, planed, filed, drilled, drawn and twisted. In addition to all these possibilities, which, whether realised and utilised or not, have been inherent to iron for all time, the modern smith enjoys the advantage of buying his iron in a vast variety of sections, ready refined, and to a great extent tempered ready for use. Every needful thickness of plate or sheet iron, bars, round, square, or oblong, of all required dimensions, and of several qualities, are delivered at his door, and an immense expenditure of time, skill and patience is saved to him. The heaviest part of the smith's task is now accomplished before he strikes a blow. On the other hand, this has not been brought about without great losses to him. The modern smith, estimable as he is, can never resume the position of his ancestors. His staples were so numerous formerly that he was wholly independent of architects and fashions, and good times or bad were all one. The community depended on him for armour, weapons, locks, chains, bolts, bars, tools, nails, ploughs, implements, shovels and tongs, pots and pans, spurs, snaffles, stirrups, bits and horse-shoes. He now enjoys but a small fraction of the craft of his predecessors, and when the fashion sets in among architects to use cast iron, or no decorative iron at all, smiths have to swell the ranks of the unemployed like their fellow craftsmen when builders are slack."

When you have come to understand and appreciate your materials like that you ought to know how to treat them.

After all that panegyric you may remember that you can build a house without one bit of all the before-named beautiful craft in iron!

Plastering.

Take another craft, that of plastering. I do not know that we have had anyone in recent times who has devoted himself so completely to its artistic expression as Mr. Bankart. When you hear what he says about it you feel that he is one well qualified to speak. "The commonness of the material, and the ease with which it is handled are mainly responsible for the contempt with which it has been treated in the last 100 years. The material such as it is combines extreme ease of manipulation with great durability. To no others do the associations of our daily life cling more closely than that with which the walls and ceilings of our homesteads are covered. It is intensely sympathetic, intensely susceptible to every touch received from the hand of the workman. It can be modelled, cast, incised, coloured, stencilled or stamped with equal freedom, from the size of a cameo to the vastness of a dome. It may be set as a jewel or it may be applied to the facade of a palace. It can be coarse or fine, either malleable or the reverse. The past use of so homely a material, once worthy of the best efforts of many of the greatest artists the world has produced, gives hope and belief that plaster may again become the medium of decorative expression in the hands of men of education, refinement and ability to understand and use it up to the possibilities and limitations of the material."

I feel so strongly as to the possibilities of beautiful plaster work that I must say a few words about it. You all know of course the simple and effective work in exterior plaster decoration which you see on old cottages, and which was so often done by the local mason, who modelled it up with his trowel on the wall,

or it might be scratched in with a fan of pointed sticks, or pressed canvas against it to produce a sort of herring bone texture, or stamped it with templates. Much beautiful work of a very simple kind was also done inside cottages; not cottages which had been cut down from manor houses, but homes for people with similar incomes to those who crowd Bermondsey or Ilford or Lambeth. Now why cannot we have some of this simple and effective work again? There are several reasons doubtless, but one of them is that we are taking all our ornament from the shop, the factory, and the agent. We are not getting it direct from the workman himself.

Why cannot we get a working plasterer to do decorative work himself? He has the easiest of all media in the world to work in. Working in plaster would come as easily and naturally for artistic expression as writing or drawing or reading or singing. Try yourself in that capital stuff; Harbutt's plasticine. It is perfectly amazing and delightful how sensitive and yet how firm it is to the slightest touch. How delightful it would be if we could have plaster ceilings or friezes done by direct handwork in such a material as this.

Mr. Bankart says you couldn't work about in the lime plaster of to-day because it would burn your fingers off, but you could have done it 200 years ago. Then you had old lime slaked for perhaps twenty years. That old stuff was mixed with sand, road scrapings, lime, cow-dung, hair and straw, and such a mixture worked fat and sound. An old man told Professor Lethaby that he remembers old stuff like this, and that it worked like leather. But whilst we lack the right stuff we also lack the right incentive.

To me it seems monstrous that each man should not be free to make the most of his abilities for his own good. But the British workman is not allowed so great a boon. He is defended by trades unions from the oppression he might suffer from employers of labour, and rightly too. He will soon I hope be regarded as real a unit of the world's life as the millionaire. If he works hard, is honest and industrious, and does his best for his family and friends he deserves a full and equal vote with the plutocrat, whatever may be his funds and his possessions. But the trades union limits the workman in his output and pay and in the kind of work he is allowed to do. A bricklayer or a joiner is not allowed to be a labourer—not for a moment—even to save his employer's pocket. He is not allowed to give the best that is in him and get full value for it. He is degraded to the level of an average which the small amount of the highest skill does not make very high. Is this fair? Is it reasonable, whilst striving rightly for the greatest good for the greatest number, that we should strike at the root of all individual freedom in this way? I would like to see an ordinary working plasterer trying his hand at simple frieze ornament or simple panels which we could use in our small houses and cottages. The fine art which has been expressed by men like Mr. Bankart is out of reach of many, but the working plasterer could give us poor folk something to relieve the monotony of our dull walls, and in doing so, I venture to believe, also something of the monotony of his own life. But you see a working plasterer and a modeller are two different things, and you can't be both. The union doesn't permit—I wonder they don't interfere with our games, and make us choose between cricket and football! The divorce between the working plasterer and the modeller is a great mistake. When one realises the beauty of simple ornament one feels there ought to be some way by which an ordinary working plasterer might be able to produce it for us, and increase considerably his weekly wage. I wish the Art Workers' Guild, which includes so many earnest and able men, would try to bring this about—the development of simple truthful art by the workman himself.

Basket-work.

If you have any doubts as to the value of basket-making you should listen to Mr. T. Okey, who says: "The basket-maker in primitive communities has a wide range of activity. He is the house builder, the military engineer, the boat builder, the maker of innumerable domestic utensils. Even now he is with us from the cradle to the grave; he makes the first receptacle wherein we are rocked to sleep, and in some cases the houses wherein we take our last sleep of all. The craft is not only important in itself, but has been the cause of greatness in other crafts. It was the parent of all the textile arts, for basket-work is literally a weaving process. The willow pattern in old china, the basket capitals and braided mouldings in Byzantine architecture are derived from basket-work." Mr. Okey knows something as to the truth of craftsmanship in basket-work if anyone does. He says of art because we have lost the thing itself we make a fetish of the word.

He recalls how Dante in emphasising the degeneracy of the citizens of Florence says in olden times their blood ran pure even in the veins of the *ultima artista*—the commonest workman. Our *ultima artista* we perhaps consider the President of the Royal

Academy! Mr. Harrison Townshend has referred to basket-work as the oldest technical and craftsmanlike process in existence. Surely this delightful craft ought to be encouraged. The Basket-Makers' Company was not a bloated affair in 1851 when its income was only 10%, and there are only 130 freemen of the company now.

Woodwork and Carving.

It is not *necessary* for my aims to-night that I should be addressing carpenters. After all, carpentry, or art, or religious forms are not the essentials. Our humanity is the essential. But we can find and follow good ideals through carpentry or anything else. Carpentry is one of the best things in the world. An honest working carpenter (and I wish I had been one!) has one of the best chances in the world to be of use to his fellow creatures. If he does his work skilfully and well he is a benefactor to humanity.

There is nothing quite to equal the variety and beauty of that craft which this Worshipful Company represents and which it is doing so much for. From the simple and expressive bench in an old village inn to the gorgeous throne of a bishop in a mediæval cathedral there is a wealth of possibility in woodcraft enough to rouse the ambition of every carpenter who has a soul beyond his next meal.

If any carver to-day shows signal ability, his work is soon in great demand, and if we had a Grinling Gibbons he would, I believe, be very quickly dead under the stress of adulation he would receive. But we want something more than really fine imitative work, we want the life of the individual put into his work. As a mere matter of the handling and manipulation of tools why should not one carver please us by his swift and unerring sharpness and keenness of touch, another by his daintiness and sensitiveness of handling, another by his keen sense of texture and relations of plane surfaces, and another by his quaint deviations from mechanical accuracy? These are the things which create individuality in work, and which under proper systems of training ought to find proper expression and encouragement. I do not think I am raising false beliefs when I maintain that if we can get our workmen to cultivate their own powers and individuality to the full there will be a public ready to appreciate and pay well for it. If I knew of a dozen carvers who could give some individuality of artistic expression to their work, in simple ways, I should be tempted to run a business myself.

If I cannot teach you anything you do not already know I can at least tell you what I see in carved work myself. Some carving is to me noisy and boastful even though it may not be vulgar. Some is plainly and offensively vulgar. But some seems to have grown up out of the very life of the wood itself, just rippling up here and there with crispness and delicacy of detail, or softness and tenderness of modelling, just as musical cadences rise and fall, softly, tenderly or brilliantly sparkling out of the silence. Some rudely executed Jacobean carving which was the result of a little (a very little) knowledge of the work of Italian artists shows such a sense of decorativeness that the halting execution and roughness of handling only seem to lend quaintness and produce an interest far beyond some of the highly finished examples to which it owed its birth. Some of that fine Grinling Gibbons carving is decorative in the extreme, but you will find examples which indicate such dexterity of skill in dealing with the materials that almost impossible feats of delicacy and undercutting seem to be performed, and then you say the carver was showing off his skill, flaunting it at you, tearing a passion to tatters and so messing his decoration! It is astounding what a lot of moral qualities may be discovered in carving. If you are a swaggerer you can display it there very well, and if you are a refined and tender artist you can lay your mind open to the beholder of your work. It is not amiss to remember that our characters show in our work and that such men as Sir Anthony Vandyke and J. F. Millet put their own thoughts on to canvas. I once noted the brilliant painting of two girls which appeared to me one of the cruellest things I ever saw. They were portrayed in their vanity and empty bombast just as the clever painter saw them, and he painted them for guineas; if he had loved them he would have done it differently. If he had been less anxious to shine in the way he knew it would pay best, perhaps he would have done better, but Israels or Millet could not have painted anyone like that.

I will now show you some slides which will indicate contrasts as to the illustration of facts, and emphasise the qualities of truthfulness and the reverse. The first exemplify the beauty of craftsmanship in wood, plaster, stone, marble, basket-work, &c. The last explain the essential difference between the truth as portrayed by the camera and the hand of the artist.*

I have shown you some illustrations of Truth as seen in various ways. I have made no attempt to do what several able lecturers are doing for you in carefully defining the technical truths of various crafts.

I have been trying to fix our thoughts on the first principles in which good craftsmanship and all good things take root. Without firm faith in truth and broad sympathy and wide outlook on life I do not believe any great art can be.

The essential truths of life have not to do with clothes or food or art or craft. You must think of man apart from his coat, the purpose of food apart from the taste, the inspiration of the art as well as the execution. There is still no greater watchword for our lives than Shakespeare gave on truth. "To thine own self be true, thou canst not then be false to any man." This cuts at the root of all affectation and deceit. It means you do no benefit to yourself or any other by pretending to admire what you really do not, by following any art you do not care for, by leading a life you loathe, or conforming to conventions you despise. You cannot take admiration or pleasure second-hand, you must be true to your belief to possess the one or the other.

If you grain deal to pretend it is oak, if you enamel slate to call it marble, if you cement and line up your brick walls to pretend they are stone, if you paper your bath-room to look like tiles, if you veneer iron columns to look like marble, if you make-believe that a poor material is a good one, you are telling lies. There are many less obvious ways of being untrue, and some so subtle that the only real dread to many people will not be realised—that they will be found out! But there are clever people who will persuade you by careful argument that it seldom pays to tell the truth and quite as seldom to act it either. When so many of our modern buildings are obvious lies, when the real constructive necessities are so completely disguised and a make-believe set up in their places, it might seem hard to talk or think of truth.

Still truth lives. It is the sun which will shine in our sky for ever.

"Truth is tough. It will not break, like a bubble, at a touch; nay, you may kick it about all day like a football, and it will be round and full at evening. Truth gets well if she is run over by a locomotive, while error dies of lockjaw if she scratches her finger."

Why are people lost in admiration over a piece of work produced with infinite difficulty for lack of proper tools, something which looks as though it had needed many tools, but had none? Why do they stand agape at the model of a church, the existence of which is explained on the label as "perseverance, cork, and glue, 1872"? Why do they not look with admiration on a fine piece of joinery finely put together, as a workmanlike expression of right tools rightly handled? What we should admire in craftsmanship is the true and workmanlike expression of the tools that are used, be they few or many. If I scratch plaster with my hands and make a decoration such as is better got so than any other way I am doing a workmanlike work. If by pressing a hair-pin into wet plaster I get a mark that nothing else gives so well, or is used so readily, I am doing the right thing. If I am going to decorate brass and have no block and nothing but a hammer and a bolt out of an old railway sleeper by way of chisel, I must do that which can be simply and expressly rendered so, and deserve no thanks if I am doing only what could be done better by better tools. It is not truth to copy a stencil pattern freehand when to use the stencil would be best. We like the texture of rough plaster and simple ornament, easily got by simple tools, or no tools at all, because we want it for simple buildings and it must be cheap. But we don't want this for mansions or town halls. Mr. Day once said: "It would seem as if every success in decorative art depended to some extent on restricting circumstances." There is the whole point. If the limit, the restriction, is a truth—if it is real—it ought to affect the result. Anything and everything but Affectation. Not pretence of hard stone if we have only soft plaster, stucco bursting to look like stone, marble done into flounces and frills. That is the eternal thing—the Truth. If you are a rogue, be an honest one; 'tis better to be an honest rogue than a roguish honest man. If a murderer, get it done and then be hanged. If you have a spark of courage in you, be Yourself.

The truthful and beautiful expression of craftsmanship is not yet a thing of common good in everyday life. We are yet lacking an everyday art, and we shall not get it till it comes as a natural, simple, and truthful expression of our desires. You go into a restaurant and find the table decorated with plants. The plants are alive; growing in red earthenware pots, nice in colour and texture, and decent in shape. But the craving for ornament must be satisfied. So they are placed in glazed pots which in colour, form and texture are abominable, or they are perhaps surrounded by a hideous pink paper frilling. Thus the problem is solved—how to conceal art for a halfpenny! I have just read a new book called "The Beautiful Necessity." Beauty neces-

* Here followed the exhibition of over sixty lantern slides.

sary? Alas! for our lamp-posts and railway stations, our common crockery and Piccadilly Circus!

‡ If we would fill our hearts with hope and sympathy for others trudging life's highway, if we would add to the pleasures of the world by making Use and Beauty join together, we must hold fast by Truth. We must not separate Art from Life, nor Life from Truth.

Truth, crushed to earth, shall rise again:

The eternal years of God are hers;

But error, wounded, writhes with pain,

And dies among his worshippers.

‡

W. C. BRYANT.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

At a general meeting held at the Leeds Institute on Thursday, 26th inst., when Mr. Sydney D. Kitson, F.R.I.B.A., presided, Mr. J. J. Wood, A.R.I.B.A., of Leeds, read a paper on the "Guild of the Comacine Masters." Illustrating his discourse by means of appropriate slides the lecturer took a comprehensive survey of the extensive area over which the Guild exercised influence.

Always in league with the Church, it was not surprising to find that the most characteristic examples of the work of the Guild were of ecclesiastic nature; wherever Christianity had penetrated throughout the ruined Empire of Rome, there the Comacine Masters had left their mark on church architecture.

Vast as was the spread of their influence, affecting such widely separated districts as Lombardy, Sicily, Servia, Germany, France and Britain, yet the presence of one immense organisation offered the only explanation of the otherwise inexplicable similarity of contemporary architecture in such places.

For administrative purposes the Guild was divided into lodges, each lodge consisting of a school where the traditions of the various crafts were taught, the Laborerium or general workshop and the Opera or administrative office which constituted the link between the Guild and its patrons. Under a President or Grand Master, the Magistri or members of the governing body of the Guild organised the various works, while the Liberi Muratori—freemasons—carried out the different branches of its work.

From the coming of the Longobards to Northern Italy in the sixth century the Guild flourished until the dawn of the Renaissance, when probably owing to its unwieldiness it broke up.

The concluding portion of his paper Mr. Wood devoted to Comacine work in the British Isles, citing and illustrating such well-known examples of Saxon-Lombardic work as Earl's Barton Church, chapels at Bradford-on-Avon and Durham, and parts of churches at Sompting and Monkwearmouth, where either in characteristic tower, round arch, or type of ornamentation the work of the Comacine Guild was unmistakable, while in Ireland he believed the round towers owed their character as certainly as did the richly ornamented crosses to the same origin.

At the close Mr. Wood was accorded a hearty vote of thanks, on the motion of Mr. Douglas Bowman.

OUR CONTEMPORARIES FROM OVERSEAS.

The *American Architect* (New York) has given further illustrations of the work of Messrs. Cram, Goodhue & Ferguson, and a complete series with plans of the Hotel Rector, a skyscraper at the corner of Broadway and Forty-fourth Street, New York, of which Messrs. D. H. Burnham & Co. are the architects.

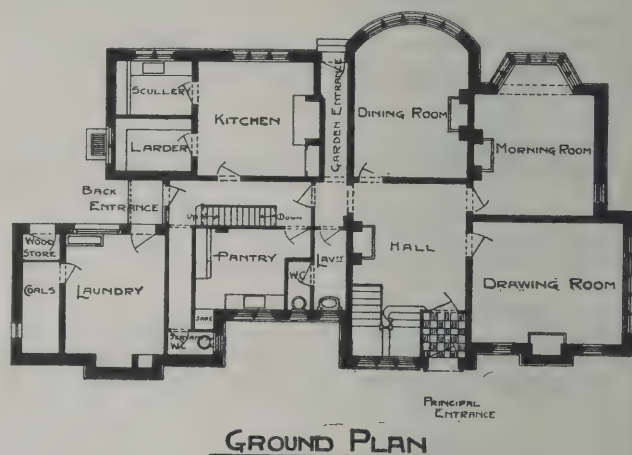

La Construction Moderne (Paris) illustrates pretty fully the fitting up of the shop or store of Messrs. Tiffany, the jewellers, in the Place de l'Opéra, Paris, of which Mons. C. Knight is the architect. This is a good example of sumptuous shop-fitting.

Stone (New York) gives a striking illustration of the interior of the choir and chancel of the new cathedral of St. John the Divine, New York. To our contemporary's score against concrete are this month added details of the failure of a great reinforced concrete oil tank near San Luis Obispo, California, which ought to have held a million barrels of oil but failed in the attempt. There is also the record of the complete destruction by fire of a concrete block church at Bridgeport, Connecticut.

ILLUSTRATIONS.

PYCHLEY HOUSE, ALLERTON PARK.

This house was recently erected on the Allerton Park Estate, a favourite suburb of the city of Leeds. It has a south aspect, and overlooks the well-wooded district of Gledhow. The lower portion is faced with specially made thin pressed bricks, the stone facings being of Cullingworth stone. The entrance hall, 22 feet 6 inches

by 14 feet 9 inches, is panelled in Austrian oak, the principal staircase also being formed of the same material. The architects were Messrs. THOS. AMBLER & SON, of Leeds.

TRAVELLING STUDENT'S SKETCHES.

We give reproductions of two more of Mr. WALSH's drawings, made during his tour as our Travelling Student last year.

INTERIORS BY MR. BAILLIE SCOTT AND MR. G. P. BANKART.

THESE views formed two of the illustrations of Mr. T. RAFFLES DAVISON's lecture at Carpenters' Hall on "Truth in Craftsmanship."

THE Middlesex County Council last week decided on the erection of a new Guildhall at Westminster at an estimated cost of 80,000l.

THE markets and plans and works committees of the Edinburgh Town Council recommend that an honorarium of 500l. be given to Mr. J. A. Williamson, the city superintendent of works, in connection with the erection of the new cattle markets and slaughter-houses at Gorgie.

THE Hull Hospitals Sub-Committee recommend the erection of a sanatorium on a site of about fifty or sixty acres of land within eight miles of the city. No particular site has been selected.

THE improvements committee of the London County Council recommend that the drawings submitted of the opera house proposed to be erected by Mr. Oscar Hammerstein in Kingsway be approved. The whole of the elevations to Kingsway and the greater portion of the return elevations to Sardinia Street and Portugal Street will be built in Portland stone, and the remainder in red brick with Portland stone dressings. Mr. Bertie Crewe is the architect.

THE Perth School Board have agreed to call in an assessor to settle the details of the proposed competition for a new academy to accommodate 750 pupils at a probable cost of 24,000l.

THE Visiting Committee of the County Boroughs of Swansea and Merthyr Tydfil invite applications for the post of architect in the proposed erection of a Joint Asylum near Swansea.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Royal Institute was held on Monday last at Conduit Street, W., for the purpose of hearing the President's Address to students and a criticism of the drawings by Professor C. H. Reilly, and witnessing the presentation of prizes and studentships. The decess was announced of the following members: Mr. Andrew Murray (Fellow), Mr. A. C. Forrester (Fellow), and Mr. E. Skinner (Fellow). The following were declared elected as Fellows: Mr. A. W. Field, Mr. H. E. Budden, Mr. A. E. Corbett, Mr. A. E. Hughes and Mr. R. G. Kirkby. The election of Sir Richard Arthur Surtees Paget, Bt., to the rank of Honorary Associate was announced. Mr. Leonard Stokes, the president, stated that the Council of the Institute proposed to give the Royal Gold Medal this year to Dr. William Dörpfeld, F.S.A., Hon. Corresponding Member of the German Archaeological Institute, Athens. He also stated that the author of the drawings submitted under the *nom-de-plume* "Civitas" for the Soane Medallion and 100l., and which were awarded the first prize, having failed to comply with the conditions and having withdrawn, the Council have decided not to award the prize. The Godwin Bursary for the study of works of modern architecture abroad has been awarded to Mr. Cecil Brewer.

Mr. LEONARD STOKES then gave the following

Presidential Address.

One of the most exciting duties that falls to your President's lot to perform is this address to students, and if only he will rise to the occasion, or at least attempt to, there is ample opportunity for him to give himself away most completely. Perennial platitudes in, perhaps, fresh disguises are his usual stock-in-trade, and you will have many a hardy annual to put up with to-night, but I can think of nothing more entrancing than to be able to deliver a really fine address to students, the most critical and exacting of all audiences, though without doubt the most appreciative.

In my opinion, however, a student alone can rouse a student. Of course, I know we are all students—(platitude No. 1)—but a student with the fire of youth running in his veins is the student that you would love to listen to, and not to such a one as I, trammelled with the chains of office and hampered by the dignity of the Chair, afraid lest I should say too much and yet ashamed to hold my tongue; duty, however, demands that I should speak, so speak I must.

Of course, you know that even the youngest of us may make mistakes, but such mistakes are simple little howlers which often set one thinking, and not the dull and heavy article produced by a president well over fifty. For this reason, therefore, I have a proposal to make to you, and it is that next year, if I am still in this Chair, the student under thirty years of age who can write the best address to his fellow-students shall read it to them, and have, into the bargain, say, twenty guineas for his trouble, and if the Council does not see its way to vote the money, I will guarantee that he gets it somehow. For his subject—if he wills it—he can remodel the Royal Institute of British Architects, and play any tricks he likes with it, and all its works and pomps. Further, I should like to suggest that the judges in this competition be under thirty years also, if that is not going too far, but perhaps you will leave this matter also to the Council and to me.

Having provided you with an address for next year does not fill up the gap to-night. You will have gathered already, however, that I am all on the side of youth; young ideas and young ways of expressing them are what I envy, the light touch of youth, so full of promise, so full of life, of vigour and vitality, is worth a great deal in all forms of art; in fact, without it what should be a thing of interest becomes an object to deplore, and what should be a thing of beauty is often very far from it.

Cultivate youth then, keep it green as long as you can, and water it well from the springs of learning, for study you must, and study hard too, if ever you hope to make yourselves felt in your generation.

I am aware that there are many modes of study, and the form that suits one may not do for another, but in one way or another you must put your young shoulders to the wheel. Do not, however, try to be too clever and artistic—with a capital A—for nothing is worse than apparent effort in design. The simple, direct, and restrained, even if it does not catch the eye of the assessor, will do you more good to have achieved than half a dozen flashy productions even if they get you the same number of commissions. Do not be in too great a hurry with your work or too anxious to get it, but go steady, and never put your name to anything that is not of your very best; also remember that it is often just as important to know what to leave out of a design as it is to know what to put in, and that the one thing of all others to be careful about is pro-

portion. The study of light and shade—a good stock phrase—is, I know, recommended by the faculty, but we have in our country so little light and so much shade, that this fact alone should make us ten times more careful with our proportions.

In my youth, I fear, I never had a good grounding in those delicious rules which give the right proportions for making everything, and I am unorthodox enough, I fear, not to be a great believer in this rule-ridden type of learning; rather would I trust to the eye and its power of judging each individual case, than to the efficiency of a rule which probably has been adduced from quite a different set of circumstances; what looks right in one case would be quite out of place in another, and although a rule may be all very well "to take off from," the sooner we get clear of it the better. Always provided—as the lawyers say—that we have trained our eyes and our judgment to do their duty properly. Ten times this may make a that, and perhaps it has done so a good many times, but there must be all sorts of exceptions to rules of this sort, and I think that at best such rules are apt to give us commonplace and lifeless results; and I venture to maintain that architecture at its best is not built up of rules, but rather of rhyme and reason. So whatever you do, *think for yourselves*. I do not for a moment suggest that you should try and be "original." Heaven forbid. But I do maintain that you should be always thoughtful and very careful. Please do not think that I want you to disregard what has been done in the past, for ours is a traditional art, and we must draw largely on the past if we hope to do better in the future. We should, however, use past examples intelligently and not blindly, even when we design on academic lines.

This brings me to a rather serious consideration. I refer to the sad lack of a sound grounding in our students generally. I know architecture is a difficult thing to teach, as in our days it is such a comprehensive matter, but I am afraid that a smattering of a great many subjects is of no real use to an architect, unless such smattering is in addition to a real solid grounding in the "three R's" of our calling. Its reading, writing, and arithmetic should not be hard to define or teach thoroughly and methodically, but although architecture is such an important study, and though architects belong to such a great and glorious profession, there is very little to guide us as to the best method of producing the finished article from the raw material at our disposal. Our public schools only teach a very little drawing, and our universities are only just beginning to open their eyes to the fact that our profession exists at all; and we ourselves are not too clear on the matter of the best course to adopt. And yet, in spite of all this, we can produce the splendid show you see on the walls to-night, of which I think we may well be proud, and we should not overlook the fact that this is the first time, in recent years, at any rate, that we have been able to exhibit our students' work in our meeting room and listen to a critical description of the work with the advantage of seeing at the same time the work so commented upon.

And now I should like to say a word or two to the prize-winners, as I have so many before me, swelling no doubt with pride, and pluming themselves in the sunshine of success. I would say to these—*beware!* Many a good man has done the same before, and never been heard of since; and the fact of your having got a prize to-day is only one more reason why you should work hard again to-morrow. It shows that you may be a man of parts, but what do we learn from men of parts in other callings? In the world of sport does the man who wins his heat to-day go on the spree, or does he train all the harder for the final struggle? You probably know the answer much better than I do. Skill of various kinds requires very careful handling, and I do not think that architectural skill is any exception. All work and no play does, no doubt, make a dull boy, but the duller man one can possibly meet is the self-satisfied prig, too conceited to learn, and too proud to keep himself in practice in the little that he really does know. I think I could prove to you from statistics that prizewinners do not by any means always become successful architects, but I have too many old friends amongst this class to make it worth while running the risk of making almost as many enemies by so doing, so I will only suggest that you should study the lists for yourselves and ponder well on your own conclusions.

Another pitfall is that travelling students often make poor use of their opportunities when travelling, and either go to the wrong places or spend their time in studying the wrong subjects. To guard against this the Records Committee is prepared to advise students where to go and what to do before they start on their travels, so I recommend you to take advantage of this offer, and at once place yourselves in communication with our Secretary.

Having cautioned the winners thus somewhat ruthlessly,

I should like to say a word of consolation to those who have not been placed. You, at any rate, have escaped the awful risks which stare the winners in the face, and if you have any grit you will not take your licking lying down. The line which divides a winning design from a losing one is often a very fine one indeed, and the very fact of having competed, and the spirit in which the result is taken, is what does the real good, and not the mere winning of the prize. So there is hope for all, including even the winners—perhaps; for study and hard work will turn the students of to-day into the Institute of to-morrow, and I trust that whether at work or at play you will not forget this Institute, which really does a great deal for students. In your turn, therefore, you must always do what you can to help it, and when you all have seats on the Council, and come in time to occupy this chair, you will be proud of the old ship and of what you have done to help to keep it afloat. You will also make and cement many a friendship in so doing, and friendships are after all very delightful and useful things to make and to have. Personally—though I do not hold myself up by any means as a model—I believe I have learned far more from my fellow-students and friends than I ever did from my teachers and masters. If you happen across a genius cultivate him, therefore, for all you are worth, that is if you do not happen to be one yourself. For the genius is a wonderful creation who has been defined in various ways, but as he is generally abnormally developed in his own particular sphere, a cutting taken from him will not be missed, will often flourish and produce fine results in the common or garden kind of students, just as a sprig cut from a fine apple-tree will produce wonders if grafted on to the common crab. The genius in his turn will derive benefit from his more plodding and business-like friend who may often suggest ways of turning talents to account which might otherwise have escaped his poetic notice.

I do not think we hear quite so much of crafts and draughtsmanship now as we used to, and probably for the reason that we have steadied down somewhat, and now recognise that architecture after all is itself quite enough of a craft to demand our whole attention. It is not necessary to be a brick-layer in order to grasp the limitations and proper principles of brick design, but it is necessary to know the size and shape of a brick before we can get very far on the architectural high road, and yet I have known young men in my time—otherwise very capable assistants!—who could not tell me the size of a brick. In other trades the same thing applies, and there is a vast amount to learn about them, so if we like to take up a trade or two as a hobby we shall no doubt largely benefit. But as we have to do with all trades it is obvious that general and intelligent observation, combined with reading and lectures, can be about the extent of our mastery of so many subjects. Drawing is our mode of expression in our type of craft, and we shall find it very useful to be able to draw accurately and intelligibly.

Perhaps I have now said enough to show you that a student's life is not altogether a bed of roses; but it can be a very happy one nevertheless if only he takes a keen, intelligent interest in his work. As I ventured to point out in my opening address, architecture is a great and honourable profession, and it should be upheld by a fine, honourable set of men. Play the game, therefore, strictly and straightforwardly; shun anything which in your own phraseology you would term "not cricket," whether in connection with your work or your desire to get it. An architect has a number of great and ever-increasing responsibilities, and his client has to place implicit trust in him, and this trust should never be abused in the very smallest degree, for although it may be a fine thing to be a great architect and produce a quantity of really fine work, yet who after all is more respected and admired by all than the simple, honest, straightforward and upright English gentleman?

(To be continued.)

THE ATELIER v. THE BUILDER'S YARD.*

(Concluded from last week.)

BUT though all architecture, large or small, is one craft, it seems to me we must appreciate that large, formal, ordered buildings demand a more rigid preliminary process in the mind of the architect than smaller work does. We in England have lost a tradition of academic style for large buildings. France has retained such a tradition, or at least built up a modern one of its own, but then in England we have a much surer hold on the whole intent and

meaning of smaller work, such as domestic and church buildings. Our best work in these directions is not imitative; it is really part of the national life. To design such work there is much to be said for the "cooking" process; but though ordinary *contrivance*, ingenuity, common sense, are the basis of all design, whether in large things or small, for the great buildings of modern times—our lecture theatres, town halls, art galleries, museums, libraries, flats, railway stations, important commercial buildings—all buildings that can be called monumental, we need, it seems to me, a basic principle, or principles, in our design, and the simplest way I can state it is this: In what way do we relate our processes of thought and draughtsmanship to the actual structure in the execution of large, ordered work? Now, if I may state my own answer, here we want the "atelier," but we want more; for the atelier, in these remarks, is only a symbol of modified, not comprehensive power. Nevertheless, we do want the root-principle of it, to my mind, and that alone which can make draughtsmanship the means that it ought to be. We want to begin with our subject at its beginning, to work from small to large, to visualise our subject as a whole, on paper, and to keep scale, proportion, mass, harmony, before us all the time. We want to work this out to its utmost possible achievement on paper before we touch anything to larger scale; and so pass on from this, and by means of this, to larger and yet larger, till we reach the "full-size," making innumerable studies—line perspectives, isometrics, diagrams—by the way. Now, this, it seems to me, is the true principle and meaning of draughtsmanship in monumental work, and the most certain process for securing good architecture. And the "more" that I have mentioned, what is it? Simply all that we have in our life—the utmost extent to which our character can inform our work. We all know how, after seeing a great picture exhibition, entering some rooms simply irritates us, and entering others pleases and rests. That is just illustrative of character in work, the power that can be gained by one man "thinking back," as Professor Pite says, so that he can truly bring forward.

And so, recognising that the architect, to be capable of tackling big work, must appreciate the big things as well as all the little things, is it reasonable to expect that he should devote such individual attention to these little things? Here I would not be misunderstood. Far be it from me to suggest that I call anything little, except relatively. The bigger meaning of it all, which is its right relationship to the whole, must all be understood, or at least intelligently grasped; otherwise there could be no Opera House. The multitude of practical details must be studied thoroughly and criticised with that larger view which is only possible to the impartial mind. Such study will become easier as time goes on, and it can be achieved without the drastic method of apprenticing oneself to a mason. Nay, can it even be properly achieved at all by such a method? That, of course, depends upon the man, but should it be necessary to make it a main plank in our platform?

Let us take three great buildings of the past at random, but representative of great periods in building; say, the Parthenon at Athens, Sancta Sophia at Constantinople, and the Farnese Palace at Rome. The two first of these, thanks to the immense value of a traditional style, might have been *contrived* in the sense meant by Professor Lethaby, though each of them is associated with a great master-builder.

The Farnese Palace could assuredly not have been so contrived. Begun by San Gallo, it was seized by the giant hand of Michel Angelo and reshaped to his embodying. I do not ask you to argue whether or not it has the same intrinsic purity of style that the other examples I have quoted possess. I simply ask you if it is not a noble building? And, since then, has any great building been erected in Europe without one informing mind behind it? This is a lesson that history teaches us, and that we cannot surely ignore? Since then the times have become more and more complex. The days move with breathless haste. Can we afford, as architects, to lose our grasp on the bigger sway? I would not argue for a moment that we should not throw our students as much into the builder's yard as possible. With that part of Mr. Schultz's paper I am entirely in agreement. But does all history, all experience, teach us that harking back to something which has its roots buried in the beginnings of things will be to our advantage? We may bemoan our lack of the sheer wonder in creative building attained by some of the older men, but the remedy must surely be with ourselves, and not with others. There are those among us who are always bewailing the lack of architectural intelligence in the public. To such I would say, "Don't think so much about other people's short-

* A paper read at the last meeting of the Architectural Association.

comings; think more about your own." The public appreciation of architecture is exactly what we architects care to make it. We, and we alone, have to be chiefly responsible for showing the public—whose needs are in the main intelligible, reasonable, and in the majority of cases, absolutely practical—that the best building it can get is the most artistic building, because it is the fittest for its purpose. I believe this can be done if the architect will but put his shoulder to the wheel.

Mr. ARTHUR KEEN, before calling on Mr. Curtis Green to open the discussion, said that Mr. Fyfe had dealt with his subject on comprehensive lines. If he understood the paper aright the method of training advocated was that actually in operation at the Association schools and which has been shown to be sound, practical and useful. It had been suggested that at some of the recent discussions in that room, the speakers had wandered very much from the question at issue. It was to be hoped an effort would be made that evening to keep closely to the point. What they had to discuss was the question that having regard to the conditions of the day and the demand for something constructionally well-arranged and well-designed, which is the right method to follow—shall they be taught by academic methods to deal with building through the art of architecture, or shall they be allowed to approach that art through the process known as building?

Mr. W. CURTIS GREEN in opening the discussion said: I have listened with pleasure to Mr. Fyfe's paper. Mr. Fyfe speaks with an authority and with a seriousness of purpose that reveal the born architect. I could wish for the purpose of discussion to-night his partisanship for the atelier had been more pronounced, that, in short, his statement was less nicely balanced and less likely to appeal to us all. Now that the best men among us are giving to education the attention that it deserves, when each of us is trying to attain the efficiency and skill which we admire in our friends or in those on a pedestal beyond our reach, it is well to reflect that, though the system is much it is by no means everything. Those who start life from a pedestal do not always build better than those who have to lay the foundation before they can start building themselves. If it is true that architects are born and not made, it is equally true that they are not born ready-made. It is more than probable that clear thinking will evolve in the near future a system of education that will make some of us regret our own lack of opportunity. But in the end it is the men that matter more than the system; we need the system to raise the whole general average of building throughout the country on to a higher plane; even then it is the full man in whom the root of the matter is planted, who will, whatever his initial mistakes and failures, express in architectural terms the virtue of his time. All of us will be agreed that many of our failures could be avoided by more prolonged training; we are in too much hurry to run into active practice either for financial reasons or because we are afraid that our friends will not wait for us. Should this additional training be in the atelier or in the builder's yard? In practice the architect must have experienced something of both. So far as the two represent two different schools of thought, I am to-night on the side of the builder's yard. The two schools may, I think, be fairly described as the *real* and the *ideal*; the real standing for the workshop and the ideal for the studio. I believe that at the present, and for some time to come, our art can be best served from the humbler side. The *realist* argues from nature upwards; starting from reality and never losing sight of it. The *idealist* argues from an idea already formed; starting from a conception, he argues downwards, rejecting realities where they do not fit in to his preconceived scheme. The *idealist* has the more lofty pretensions. The *realist* achieves the most elevating results. We architects have to look at things as they are, not through the mists of fancy, nor with the eyes of an age now past. Let us regard our work from the point of view of those who will judge it after we are gone and forgotten. What is the standard by which they will judge? If the lines laid down by the architect are the outcome of inspired common sense, a cultivated sense of that line of economy which Emerson has so well described as the line of perfect beauty, if the materials used are suitable, the best of their kind rightly and fitly used and joined together, I can imagine that a building of our day may win something of the respect and affection from those who come after us that we feel for the work of our forbears. Some of us have yet to learn that half of the charm of the historic architecture of this country lies in the materials used and in the skill with which they were laid down. Take a mere brick wall as an illustration. Let him who supposes that he knows every-

thing necessary to produce a beautiful piece of walling try to do so—I do not mean with his own hands; supposing he failed to do so, he might then read Professor Pite's essay on brickwork in the first volume of "Building Construction" in the Architect's Library; let him learn all that is to be learned from that masterly monograph, then let him try again and compare the result with any good pieces of old work; let him analyse the result, and his own feelings! Academic architecture fails to win our affection, although it may and does inspire our unstinted admiration and respect. The reason of this is, I think, that the tendency in cold academic design is to overlook the human element in its production. Which moves us most profoundly, the art of the Colosseum at Rome, or the front of Rheims? Is it true that our modern methods of building are more akin to Pagan Rome than to Christian Rheims; is that resemblance an ideal to strive for? I believe that the weakness of modern English architecture lies with the producer rather than with the designer. The British working man is the stumbling-block in the path of our best architects. Through no fault of his own, his natural taste for sound craftsmanship has been perverted. He has had set before him the false standard of excellence created by machine labour applied to illegitimate ends. He has learned his lesson thoroughly. The subdivisions of his one-time craft evolved in factories and by trade unions have destroyed both the self-respect and the pleasure which he once derived from his craft. This evil does not imply that we should get back to this or that school or period, or that we should embrace the affectation of a revival remote from our ways of life and thought. I would remind those with a tendency to admire all things old to remember what Wm. Morris wrote, speaking of old buildings. He said, "If these buildings are beautiful now in their age, what must they have been when they were new?" To those who believe that the standard of craftsmanship is connected with the well-being of architecture, the detached and superior attitude of the atelier will hold little hope of the future. I am not of those who imagine that drudgery can be done away with; there must be drudgery in the making of every work of art; it is a necessary and a cleansing process. The man who cannot bear his share will produce nothing of value; yet I believe that the architecture that affects mankind most strongly for good has the minimum of drudgery, that it is produced by labour, inspired by a common tradition, emulating that tradition. Let us have a controlling mind. I should imagine that no great performance in architecture was ever without one; but the master workman must have sympathetic tools, keen to respond to his suggestion, not compelled by force or fear. Part of our calling—it should be a self-evident part—is to master our tools. Can the conditions in which our work is carried out be studied in the atelier? Can we influence or direct the man who crystallises our idea until we learn what he has to teach us about the genesis of that idea? Can we design rightly in materials the properties of which we do not understand and cannot learn from books? The whole question of the right and the wrong use of mechanical labour is for us to pronounce on; where can we learn about it but in the builder's yard? I suppose there has never been so much skill at the service of architecture as to-day. In the country it is extraordinary how quickly and with what pleasure the men on the job respond to the traditional ways of their crafts when they are allowed the chance. We want a living traditional school of modern architecture, and it is coming clothed and in its right mind; our architects must be craftsmen not with their own hands, though a thorough knowledge of the bench or the lathe in their youth will have done wonders for them, but in the sense that they must know that there is a right way of doing a piece of work and a proper use of the materials at hand. If during our student days we are trained to deal with the real things first, not standing aloof from the facts of life, we may come to express in concrete form the ideal to our fellow-men.

Mr. W. H. WARD said that as in the case of politics one is obliged to choose the lesser evil, so in the case of the matter under discussion one might choose the greater good. But one was not debarred from enjoying the advantages of both sides. It seemed to be agreed that tradition was a necessity. When people felt that all was not right in the architecture of their day the only thing was either to improve a little or go back a little. The only way in which nowadays it was possible to get into touch with tradition was through the atelier. The building industry is now so specialised that it would be impossible for a man to practise as an engineer, as a bricklayer, as a plumber, and all the other trades. Craftsmanship as described by Mr. Curtis Green was robbed of all its terrors. The effect of undiluted atelier training was seen in the small

villas of France which are nearly all ghastly failures, being either attempts to design on a monumental scale in miniature, or else they are some awful form of new art.

Mr. W. H. SETH-SMITH said he presumed that the purpose of a professional education was to teach architects how to make the best of their general education, and so to serve the community to the very best of their ability. Lacking both these sides of education a man must be greatly handicapped, and if he is a person of ordinary ability he is only fit for working in an office. A knowledge of history is essential for the formation of theory, and a man must go back and learn from the experience of his fellowmen in the past if he is to produce theories on which he can base his work. It would be absurd to ignore the importance of that past when looking for guiding principles as to the best way of training the young men of to-day. It was also of importance in a school like that of the Architectural Association that the students should feel that such principles had been thoroughly thrashed out and laid down with the greatest possible amount of care, and that their training would be of a kind to promote the best that was in them. Consequently the audience that evening should feel particularly indebted to Mr. Fyfe for taking up the subject and enabling them to discuss which of the two systems of education was the best. The pith of the matter seemed to lie in Mr. H. H. Statham's paper read a fortnight ago, which he founded on the words of Walter Pater concerning the spiritualities which lurk round architectural form. Mr. Statham had also emphasised the idea that there was magnificence and greatness in working out the architectural idea in plan and section and studying it in all kinds of ways. Mr. Seth-Smith went on to say he would like to differ warmly from Mr. Curtis Green's contention that the value of a lofty ideal was questionable. Unless there was such an ideal it would be impossible to attain very high; for the higher the ideal the greater will be the achievement. The ideal need not be an academic one. Nothing too bad could be said about the results of a purely academic course of instruction as exemplified in the French beaux-arts methods. Their smaller architecture was indeed a total failure. This was the more astonishing in view of the fact that the French were perhaps the most artistic people of Europe. They seemed to be trained in the grand style to the exclusion of smaller objects such as cottages and domestic architecture. Taking the opinion of the architects of the whole of Europe generally they are unanimous that our work up to monumental architecture is superior to that produced anywhere. There was need to supplement the instruction given with such success in smaller work by working on a larger scale, and by imparting training on the highly theoretical lines of a civil engineer. Would training in the workshop render an architect more competent to master the large problems of town-planning? He could not quite agree with what Mr. Fyfe had said in high praise of the Paris Opera House. An architect who had watched its erection had described it as a tissue of falsity in construction. Westminster Abbey and Westminster Cathedral seemed better to illustrate Mr. Fyfe's point. Mr. Seth-Smith said he did not think that he had ever seen a building carried out by a builder without any architectural training, that was entirely satisfactory from every point of view. It was difficult to say if men like Mr. T. G. Jackson and the late Mr. John Bentley would have achieved better work if they had had a workshop training. The moral of the paper seemed to be that they would. If a young architect had a year to spare it could not be spent better than in going through the builder's workshops, and they would be very pleased to get a pupil of that sort at a low premium. Architecture had very often been compared to a musical composition, and it was certainly true that a man need not be a master of every instrument in order to get beautiful results out of an orchestra.

Sir A. BRUMWELL THOMAS expressed surprise at finding so much gentleness between the two gentlemen who read the opening papers. Two points of view had been put forward, but they could hardly be described as antagonistic. A desire to find the best form of architectural training was general, and it seemed as if both points of view would have to be included. In his own opinion there was no question that the training of the architect of to-day should be academic. Mr. Fyfe had backed his argument by quoting from papers read in 1898 and 1900. But since that time much water had flowed under the bridge of education. The question of the atelier versus the builder's yard seemed now a little out of date. There existed unquestionably at the present time a very considerable agreement in favour of academic training. Up to a certain point in the history of architecture the master spirit had been a craftsman; but after then a different sort of man was required. With regard to the criticism of French

domestic work it seemed to him that it is now beginning to show a spirit worthy of admiration; though speaking generally, it does not come up to the English. Personally he had only come across one delightful small house. It was a perfectly charming example, and showed all the effect of the "beaux-arts" training in little. On inquiring the name of the architect he was informed that he was Monsieur John Belcher. The explanation of the fact that public opinion towards architecture was so much more consolidated in France than in this country seemed to be that across the Channel there is only one recognised consistent form of training, while here many different opinions exist among artists. The training of a French architect was a tremendous test from the artistic point of view. For the first two years it tests him whether he is an artist; then he studies science; then for the next two years all constructional science is left behind. In France the pupil commenced with the small "projet," not tackling the big lay-out till some time afterwards; and he is trained in design at once. In this country he is given a very great breadth of scholarship before he is called upon to design. What the future of architectural training may hold in this country is in the lap of the gods. There was no question that strong academic training will come into force. But it needs most careful consideration as to what change should be made in the training of architects.

Mr. LEWIS JACOB thought it was most difficult to take sides on the question. The test seemed to lie in the results produced by the two systems referred to. There were some architects who were "fair terrors" when in a builder's yard, with their ability to pick up any tool and show the men how to do their work. The result is no doubt that they get a most sound and substantial building; but not necessarily one remarkable for its artistic qualities. That exemplified the danger of relying too much on the one side in an architect's training. The faults of relying too much on the other have been shown in the French domestic work.

Mr. G. DRYSDALE complained that in England everything seemed to be a matter of taste. If there was a little more reason and a little less taste things would be better. The contrast between French and English domestic work was partly to be accounted for by difference in temperament. An Englishman when he goes into the country loves to be quiet. The Frenchman regards the country as a sort of desert. Here also we bring the country into our towns.

Mr. WALTER MILLARD confessed to having found fault at once with the title of the paper. He would rather have it expressed as, "The Atelier *cum* the Builder's Yard." Architectural educationalists wanted to know how to combine the best points of those two training-grounds. They were not to take without a grain of salt such picturesque sayings by Mr. Schultz as:—"I am not hopeful that a good general type of modern building will be seen until all we architects are abolished, swept away, root and branch." Another one to which the same remark applied was that quoted from Professor Lethaby that "Design is merely contrivance, the doing of work in an ordinary way, just like cooking." Architects certainly want knowledge to understand the first requirements of architecture. If one trade is mastered it is necessary (according to the builder's yard theory) to master all the trades, and all the tools of all the trades. This becomes rather a big order. What is hoped for in present-day students is that they will be led or driven or drilled or trained into an understanding of their profession. They must hope and pray that they would acquire insight into what has been done—insight allied to foresight. On foresight depends so largely the power to grasp problems and solve them by the aid of that second sight which is termed imagination.

Mr. H. P. G. MAULE said he would rather regret the reading of such a paper as Mr. Fyfe's were it not for the different utterances it had called forth. Mr. Fyfe no doubt really recognised the necessity for both sides of training, and if he had had practical experience in training he would have held that opinion still more strongly. The discussion of such a proposition as "The Atelier *versus* the Builder's Yard" was misleading and apt to produce harm. There must be an academic training and a practical training, a training in design and a training in the materials out of which design is built up. Consequently the paper had a false start. Every argument could be advanced in favour of a combination of the two. It was admitted that English domestic architecture ranked very high in the estimation of people in France, Germany, and America; English public architecture was not placed so high. But it should be borne in mind that the present system of architectural education had only been running a short time. It was well to analyse

the process by which good domestic work is brought about. If one took the careers of recently dead and of living architects it would be found that scarcely one of them could be called in the literal sense a skilled craftsman. But they probably had a very intimate knowledge of how the various processes were done. It is impossible to learn each trade; but surely part of an architect's training must consist in knowing sufficient of the processes of any trade to be able to design aright in the materials employed! Consequently in some part that training must be severely practical. A student must also have the training to design on an all-embracing scale. The all-important question was what form the combination of these two should take. We are, said Mr. Maule, as a nation very practical and far more successful by rule of thumb, unassisted by real science, than most other races. The average English student can be approached and interested most easily by treating a subject from its more humble and practical side; but the higher ideals need not in consequence be lost sight of. The whole art of the teacher consisted of holding up high ideals, and eventually to lead the student up to the big subject. The best is got out of him by approaching him from the material point of view. It was advisable to avoid the use of such an expression as "our training must be academic," because people were inclined to translate that adjective in a sense not meant. All catch-words and partisanship ought to be avoided also. Training should be regarded from a very broad and, so to speak, English basis—i.e., judging what is best for our purposes and best adapted for the English mind. In a great deal written about architectural training the point of view of the student is forgotten, and the educational method of approaching him is ignored. Nevertheless that human point of view must be adopted from the very first. The fact that our secondary education is on a wrong basis is lost sight of. We start with our students from a different point to that of America or France. If a commencement were made on a too academic or too advanced a plan, the hands of the clock would be put back and a check placed upon a great many satisfactory designers of everyday buildings. Mr. Maule concluded by urging that no vote should be taken on one side or the other, as there was a lot to be learnt from both the atelier and the builder's yard; furthermore, a great deal of ground had to be covered before it could be settled which was the best system for the education of architects.

Mr. D. A. FORSTER said if a vote was to be taken he would like to propose an amendment to the effect that both the atelier and the workshop were necessary if a perfect result is to be attained. It would be impossible for every architect to know all about trade tools. It seemed to him that good architecture must mean good building, and that if there is to be good building the architect must know how to use the materials. The actual design is only a means to an end; and that end is the production of buildings, not the production of designs.

M. P. CART DE LAFONTAINE compared the length of the period of training in France and England. At the Beaux-Arts a student commenced at eighteen years of age and continued until he was thirty.

Mr. GERALD C. HORSLEY recalled that twenty years ago the subject under discussion agitated the students of the time very much. He remembered being deeply concerned as to whether it was the right thing after pupilage to go into a builder's yard or into an office, or indeed whether it might not be the right thing never to enter into an office and to go into a builder's yard altogether. He asked a distinguished architect for guidance, and the architect said that if he had his time over again he would go into a builder's yard. A few of his (Mr. Horsley's) contemporaries decided not to set up an ordinary office with a brass plate, but to start work as architect-builders. This appeared to him an entirely unsound course to adopt, and he did not follow their example. Time would seem to have justified that course, because of those few, one has given up the profession of being a builder and has since worked as an architect on conventional lines. The others have not had a very wide range of work, and though what they have done is extremely interesting and beautiful, it has not led to a large quantity of work, and certainly not to work of any size or importance. The present-day student probably views this question in two lights. First he is deeply concerned as to the good of the art he is following and whether he is working on the right lines to further the interests of that art, and secondly he is concerned to know whether he is learning what he ought to learn. Most students now take the syllabus drawn up by the Board of Architectural Education as the basis of the direction of their work. But, said Mr. Horsley, that syllabus does not

go far enough. It only deals with the first four years of a student's training, and says nothing as to what he should do after. That omission partly accounted for the discussion that evening. There was no authoritative statement yet issued concerning the best way of combining the atelier and the builder's yard. Probably all agreed that a combination of the two was the right method. The absence of such a statement was a great drawback to students, and it was to be hoped the new statement due to appear shortly from the new Board of Education would advise as to what they ought to do. If there should be at the end of the discussion any pronouncement as to the feeling of the meeting on the subject, he would like to express his personal opinion that the time devoted to studying processes of building in a builder's yard would come better after the term of training and pupilage than before. In the practice of engineering the opposite order occurs, for students go first to the workshops and then afterwards to the drawing-office. But an architectural student wants to see what the processes of design are, and the only way of doing that is to be in an excellent school, like that of the A.A., and then to enter an office. He might with advantage act for a time as clerk of works or be under one on a job.

Mr. ALLAN POTTER contended that academic study was wanted more than anything else; but to be any good it must be practical. One great difficulty at the present time was to get a unanimous opinion about what is good and what is beautiful. It had been argued that what appealed to the greater number was probably more beautiful than what appeals to one. But we know in practice that such is not the case. Next it was said that the most perfect beauty is what is appreciated by the most perfect man—i.e., the one who is organised and developed to the highest pitch of harmonious working. For contemporary needs, however, it may be accepted that if a building appeals to the best minds at the present day and equally satisfies them, it is probably a more beautiful building than one which would appeal to either of the other two classes. We have no works of the most perfect man, though we have a basis of study in Nature. In Nature forms are continually changed in accordance with different circumstances and different requirements. Whatever form Nature takes, however, beauty crowns all. There are forms shaped definitely to achieve certain functions. In the architectural world they were all tired of fashion and revivals. The great danger of the present feeling of interest in Greek work and in the grand manner is the possibility of it merely becoming a revival of a revival. The nineteenth century was a century of research and the finding-out of facts. We have now a tremendous storage of facts, and we want to turn them to use. The Gothic arch was to the Greek lintel what our steel construction is to the Gothic arch. We should to-day try to design an architecture suited to our present circumstances, just as mediæval architecture was to its circumstances and Greek to theirs. All design must be based on knowledge of materials and construction and circumstances; but any training that provides only that knowledge is as incomplete as the training of a man would be if he occupied his time solely in physical culture.

Mr. ARTHUR KEEN in closing the lengthy discussion said he would not take a vote on the motion. The only criticism he would make was whether there had not been too great a tendency to discuss the matter of training without sufficient regard to what an architect at the present day really had to do. It is now practically impossible for him to carry on his work except by designs on paper. There were also his multitudinous other duties in connection with a building to consider.

A vote of thanks having been passed, Mr. Fyfe briefly replied to some of the points.

The next meeting of the Architectural Association will be on February 6 when Professor W. R. Lethaby will read a paper entitled "Greek Buildings."

ITALIAN ART IN THE NINETEENTH CENTURY.

THERE is now on view in the Furniture Galleries of the Royal School of Art Needlework, Exhibition Road, a really remarkable clock, which for beauty of design and delicate workmanship might well rank with any of the famous masterpieces of olden times, when artists and craftsmen combined to produce wonderful clocks since treasured in museums and the galleries of private collectors.

This most interesting illustration of Italian art is modelled in solid ivory—carefully selected and most richly carved—standing 57 inches high. There is a dignity in the architectural lines commanding attention, and the solid ivory

plinth or base gives a sense of security and enhances the beauty of the delicate carving.

The pendulum, itself a piece of exquisite mosaic, is enclosed and guarded by golden gates jewelled with tiny pearls, and the pillars supporting the clock are formed of lapis-lazuli, and enamelled. The dial is also enamelled and surrounded with garnets.

Perhaps the most beautiful part of the work is a carved ivory plaque in front of the base, representing "Harvest," while the principal carving surrounding the dial is an exquisitely detailed piece of work representing nymphs, cupids, and various allegorical figures.

The purity of the ivory is heightened by a judicious introduction of emeralds, rubies, and amethysts, and the cornices are beautified with perfectly modelled ivory figures typical of the four seasons. A carved figure of "Time" surmounts the entire structure, itself silent, but as the clock in dulcet tones strikes the hour, this ivory emblem seems eloquent with the unspoken motto "*Ars longa vita brevis.*" Altogether, quite worthy a visit of inspection is this beautiful example of Italian workmanship, and the Royal School of Art Needlework, always rich in treasures of embroidery and lace and antique furniture, may be congratulated on its enterprise in having secured a work of art such as is seldom seen in this country.

THE ILLUMINATING ENGINEERING SOCIETY.

THE LIGHTING OF LIBRARIES.

(Continued from last week.)

FOR practical purposes the most important light for the reader is and must be, the local reading-lamp. No general lighting will meet the case, for it would involve a wasteful and intolerable blaze in order to obtain sufficient light to read by.

It is of great importance to provide a *separate light for each reader*. Every librarian will at once cry out about the luxury of it and the cost. As to the luxury let it be remembered that the necessities of to-day were always the luxuries of yesterday, and the separate light will be the necessity of to-morrow. As to the cost it can be shown that it is more economical. The principle has already been adopted in the libraries of several clubs, in which a shade is used something akin to those made for theatre orchestras, although a dense green ordinary cone shade, with the lamp well recessed, would be equally satisfactory, and the position of both lamp and reader be pleasantly seen. There are other simple forms of shades to meet special needs, but in all cases the depth of the shades must be adjusted to cover the eye in sitting or standing. At the British Museum there is one reading-lamp between two readers—this means that for one reader the lamp is on the wrong side, while it often produces an unpleasant jostling of heads and elbows, and a feeling in the heart of each that the other is trespassing.

Librarians have pointed out that when readers are within control of the lamps they frequently and selfishly endeavour to monopolise more than their share of the light to the discomfort of others; whereas the real interpretation should be that the reader absolutely needs more light. Nothing produces aching eyes more readily than an insufficiency of light.

The tendency of the librarian is to treat every reader alike. Well, that sounds fair enough, but in reality it is very unfair, and is thrusting unnecessary hardship upon all classes of readers. Men's eyes differ: some experience trouble for want of light, others from the glare of excess; sometimes a reader gets bright white paper and large type, and he needs a quiet light; later he may have dark paper, small type, or an indistinct drawing, and will need a strong light, while some paper needs a careful adjustment of the incidence of light—all of which means that no two readers need the same light, and leads to the next essential point—viz. that *every reading-lamp should be adjustable and under the control of the reader*. When at home do we not find it essential to be able to adjust the light to our work—the need must be the same in a library. There are a number of suitable devices for movable lamps already on the market, and a little ingenuity might add to their suitability. Broadly they are of two kinds, those which move up and down only and those which move in several directions—either may be standards, brackets, or pendants. The lamp should reach down to about 1 foot from the desk and rise to about 2 feet 6 inches.

With regard to the necessary intensity: a clerk writing on white paper may do very well with 1 foot-candle, as the eye-strain in writing is not nearly so great as for reading, where at least 3 foot-candles would be required to meet the same effort. The amount of illumination on a table or desk should, at a distance of 2 feet 6 inches be about 2 foot-candles, which, when lowered, would be increasable at the reader's will to about 12 foot-candles.

He went on to suggest a considerable saving in current expenditure without depriving the reader of the "luxuries" advocated, and that is the third point—viz. that *readers should be left to switch on and off their own lights*. Some librarians say that the public could not be trusted to deal with movable lamps and switching arrangements. It is a slowly dying prejudice. Public enterprise has over and over again shown that it pays to put confidence in the people, more particularly when they are intelligent readers. He had been in the South Kensington Library when every light had been going with scarcely a reader; in the Patent Office when nearly all the tables were empty; in the reference library and newsroom of the Guildhall with but five readers, and in each case all the lights were fully going as though they were being used. Is this economy, and what has the taxpayer to say about it? If, on the other hand, his proposal were adopted the reader would walk into a quietly lit room, select his table, and switch on the light which would be concentrated on his

book. When he leaves his desk it should be and would become a matter of ordinary good behaviour for him to switch off his light; but should any one fail to do so the assistants are always on the spot and could easily remedy the omission.

There would be, of course, a little extra first cost—100% should cover it in any library—and if that is objected to let that extra cost be saved out of the architectural ornament, for much as we may approve of a worthy building for a worthy purpose the book and facilities for reading it are the *sine quâ non* of a library.

All this implies that each reader should have an apportioned space or desk. It is done so at the British Museum with a width of 4 feet 3 inches, but 3 feet 6 inches should be ample for simple reading.

Much that has already been said will apply with equal force to the newsroom.

In the majority of libraries, although there is often a brave show of lights, the stands are badly and unequally lit. The rule appears to be to distribute plain pendants throughout the room, regardless of the positions of the stands or desks, and consequently the amount of light in foot-candles reaching the newspaper is often ridiculously small. At the Guildhall and at other libraries the reader is able to admire the form of his own shadow in front of him, and has to read through the gloom of it. At Wandsworth, Kensington, and many other places a lamp is suspended directly over the stand—the very worst position, for by reason of the extremely oblique direction of the rays the illumination is very small and reading is rendered still more difficult in consequence of the puckering of the paper. Fig. 2 illustrates this. A

FIG. 2.

is a 30 c.-p. lamp, the downward radiation of which is, however, only 18 c.-p. The lamp is 3 feet from the centre of the desk at B, and the angle of incidence A B C is 10° ; therefore the illumination of the slope is $\frac{18 \sin a}{3^2} = 0.34$

foot-candles. What a miserable result from a 30 c.-p. lamp, and what a waste of light!

The best arrangement he had seen is at Cripplegate. The newspaper-stands are 8 feet long, for two newspapers a side, and 2 feet from the end of each—that is, in the centre of each newspaper—is a bracket lamp at about the level of the top of the stand, and projecting 15 inches. A light of about $3\frac{1}{2}$ foot-candles is thereby obtained from only an 8 c.-p. lamp. Here you have a splendid light for a small expenditure of current, and independent of the crumpled paper. On the other hand, the lamps are painfully visible whichever way you turn; a simple improvement would have been to have had deeper shades and to have them directed towards the newspapers, as in fig 3.

Referring to the subject of paper-gloss, Mr. Darch said that we all know the unpleasant effect of the reflection of a bright sky from the surface of water or from wet streets, and are generally in haste to remove ourselves from it. Precisely the same thing happens, but in a lesser degree, with paper. There is no paper that has not more or less of a distinct gloss when viewed in the angle of reflection from any bright light—and it usually happens that the ink is also glossy—consequently, not only is a greater effort required to distinguish details, but the excess of light and heat

FIG. 3.

which may be unnoticed at first becomes eminently irritating and injurious in the course of a protracted sitting. This can easily be avoided, and it certainly should enter into the calculations of the illuminating engineer.

Let us take a news stand, fig 4. If the lamp were at B the incident light at A would reflect into the reader's eyes; in like manner, if the lamp happened to be placed higher or lower, then the glare would be seen at correspondingly higher

FIG. 4.

or lower points on the stand. It follows, therefore, that to avoid glare from any part of a newspaper the lamp must be placed somewhere on the line D E.

(To be continued.)

[The Editor will not be responsible for the opinions expressed by Correspondents.]

The Royal Mausoleum, Frogmore.

SIR,—May I ask you to be so good as to contradict a report extensively circulated in the daily press in connection with the recent memorial service at the Royal Mausoleum, Frogmore, and regarding the lately completed decoration of that building? Apart from certain inaccuracies in the description of the work, the reports in most cases contain the misleading statement that the work was only executed and not designed by myself. This is totally incorrect. I myself designed, as well as painted, the groups of angels which form the subject of the decoration of the interior of the dome; and all the stained glass, with which the windows of the Mausoleum are now entirely filled, is likewise of my own design.

I must apologise for troubling you in the matter, but my professional reputation as a decorative artist would be seriously prejudiced if the impression were allowed to go abroad that my personal responsibility for the numerous commissions, at Windsor and elsewhere, entrusted to me by their late Majesties Queen Victoria and King Edward was limited to only the merely mechanical portion of the work.—I am, Sir, yours faithfully,

ION PACE.

Milneholm, Hounslow, Middlesex: January 27, 1911.

Petrol Air-Gas.

SIR,—Professor C. A. M. Smith, M.Sc., in his concluding paper on the above subject has recommended the appointment of a committee of the Royal Society of Arts to investigate and report upon the merits of any and all apparatus entered for competition, and the writer welcomes the suggestion, and would support it in every possible way, as certain claims have been made for particular systems of air-gas, and the sooner these are thrashed out and it is determined whether or no these claims can be upheld the better.

To make the report of any practical value, the actual cost of the gas, taking the price of the petrol (obtaining when the tests were made) used by the various plants, would have to be given, and the tests should include, not only the capability of producing an uniform gas under varying loads, but the efficiency of the gas for lighting and more especially for industrial heating.

It would make the investigation of much greater value if comparative tests with coal gas could be conducted at the same time, as it is most misleading to make comparison of heating efficiency from calorific values, as the calorific value of coal gas always quoted is that obtaining at the gas works, and not as

delivered to the consumer, and a self-consuming air-gas mixture lends itself to a much more perfect application than is possible with coal gas, and every practical engineer knows how very important is the application of the gas for the purpose of economy and efficiency.—Yours faithfully,

THOS. H. GLASSCOE.

January 28, 1911.

Old and New Work.

SIR,—Mr. Fyfe's thoughtful paper at the A.A. leads me to remark that, though I would not say that the old work was never wrong, I do say (speaking for myself) that it is rarely as wrong as is much of the work of our own day, and why? mainly because the faith and the humility of the old men are now generally absent. Whether artist or craftsman, though their work remains with us, their names but rarely do.

In a sentence, I for one believe in our doing our very best for the small things, leaving the great ones to greater minds. The small things abroad seem, more or less, left out in the cold, but we need hardly strive to imitate that. Anything worth doing at all is worth doing well, let who will sit in judgment on the result. All may and should work in accordance with opportunity, and in the spirit of our several measures and limitations. These we can rarely ourselves control. The tuition, whether of the "Atelier," or the "Yard," each good in its own way, is no barrier against self-conceit which, by substituting self-respect for it, may end in much good result for us all, old or young. There would be little demand for bad and cheap building if we all paid that attention to the small matter that, somehow or other, is supposed to be beneath our notice. As Ruskin said "Phidias can niche himself in the corner of a pediment."—Yours truly,

E. SWINFEN HARRIS, F.R.I.B.A.

York Minster.

SIR,—There is something charmingly gracious in the velvety darkness of a summer night, and its sweet freshness roused me, as after a long and wearying journey I made my way out of the station. When I got well outside the very stillness and quiet seemed not to betoken so much the sense of loneliness so usually associated, but rather one of magnificent solitude.

My path homewards led me in the direction of the Minster.

At this hour the mind refreshed by the cool night air seemed more fit to receive and revolve impressions. A description I once came across of this, one of the loveliest of our English cathedrals, viz., "A Kyrie Eleison in Stone," by its very brevity conveyed more than a mighty volume.

When I reached the N.W. front I was compelled to stand and gaze. Even at this moment the gentle breeze that whispered round the sacred pile became fraught with messages of sanctity. How the air was redolent with visions of the mighty past; of warriors who had pledged their vows, of prelates famous, and all the mighty pomp of mediæval Christendom. For there, sequestered deep in niches, one could unconsciously trace figures illustrating the piety of the souls that helped to enrich.

"And such too is the grandeur of the dooms

We have imagined for the mighty dead."

Gradually one's gaze wandered slowly to where the silvery grey of the outlined pinnacles seemed to climb into the dark pall of the night. 'Twas not the details that pleased in this light, but rather the intense magnitude of the building.

The sense of solitude and quiet was supremely entrancing, not bewildering by its sense of loneliness, but rather as an impressive glimpse of the potent rule of time. But even now the silent workings of the dawn were busiest, and ere the last glorious sparkle of a golden star had begun to fade before the soft approach of a summer morn, a bird in the far distance twittered cheerily, and with a sigh for such a moment of exaltation, I turned to wend my way homewards.

WILFRID J. MILBURN, Sculptor.

Bootham Bar, York.

MR. A. CARNEGIE has intimated that he will give 2,000l. towards the establishment of a free library at Huthwaite on condition that the town provide a site, and agree to a rate of one penny in the pound.

THE Rochdale Art Gallery Committee recommend the Town Council to extend the present building to accommodate the thirty pictures presented by Mr. R. Taylor Heape as a Coronation gift. Already the gallery is overcrowded. The cost of the extension is expected to be about 5,000l.

FORTHCOMING EVENTS.

Saturday, February 11.

Royal Institution : Mr. T. G. Jackson, R.A., on "Architecture—The Byzantine and Romanesque Period."
Architectural Association : Second Spring Visit—to the Money Order Office, Holloway N.

Monday, February 13.

Royal Institute of British Architects : Papers by Mr. Paul Waterhouse and Mr. E. A. Rickards on "The Artistic Development of London."
Victoria and Albert Museum : Mr. Banister Fletcher on "Westminster Abbey" (University of London lectures).

Tuesday, February 14.

Royal Academy : The Dean of Gloucester on "The Merovingian Abbey of St. Martin of Tours (A.D. 472-A.D. 999)."
Nottingham Architectural Society : Exhibition of Designs of Ecclesiastical Work and criticism by Mr. W. R. Gleave.
British Museum : Mr. Banister Fletcher on "Roman Tombs, Aqueducts and Bridges" (University of London lectures).

Wednesday, February 15.

Edinburgh Architectural Association : Paper by Mr. Lawrence Weaver.
Carpenters' Company : A Demonstration in Modelling by Mr. Alfred E. Drury, A.R.A.

Thursday, February 16.

Illuminating Engineering Society : Discussion on School Lighting, to be opened by Dr. James Kerr and Dr. N. Bishop Harman.
Carpenters' Company : Mr. W. E. Riley on "The Transition of London's Plan and the Disappearance of its Land Marks and after."

STUDY AND STUDENTS.

IN his presidential address to students at the Royal Institute, Mr. STOKES touched lightly upon some of the most important and at the same time most difficult problems connected with the studentship days of a young architect.

Emphasising the importance of proportion as an element of architectural design, the President ran a tilt against the "rule-ridden type of learning," by which we understand he intended to refer to the canonical systems of proportion to which so much importance was attached in the middle period of the Renaissance. Here we are face to face with one of the earliest difficulties that confront the student in his study of design in architecture. It is impressed upon him by his teachers that good proportion is all important, or, at least, of primary importance in architecture. How is he to ensure in his designs any sense of proportion at all, and how is he to distinguish between good proportion and bad? Or to know whether proportion admits of a distinction between good and bad, or merely of existence and negation?

There can be no doubt that in all good architecture there is proportion of an exact and definite nature, and that the investigations of PENROSE on the existence of systems of proportion in the masterpieces of Greek architecture have revealed actual facts and not imaginary figments.

This is not to say that ICTINUS and his contemporaries adopted arithmetical rules for the proportioning of the major and minor parts of their designs, still less that they employed definite systems of ratios. Neither need we suppose that TURNER painted his pictures with a conscious recognition of those rules and principles of composition that RUSKIN has told us are to be found exemplified in the work of the master. But we have the artist's own authority for the saying that he mixed his colours with brains. How much was due to conscious and how much to sub-conscious intelligence we cannot attempt to determine.

As excellent works of architecture can be demonstrated to possess proportions expressible in definite ratios, it is scarcely surprising that PALLADIO, VIGNOLA, and the rest should endeavour to formulate rules by which satisfactory proportions should be an accompaniment of the buildings they designed, and by restricting themselves to certain approved combinations of modules and minutes should believe themselves able to produce a pleasing effect on the eyes of their contemporaries and critics.

Nor is it only in the Greek or Renaissance periods that we find buildings that have been or may have been designed with the help of recognised systems of numerical ratios in order to incorporate what we call proportion. We

know that in mediæval times designs for buildings were proportioned by the use of systems of triangulation, so that we may conclude as a general proposition that in every epoch of excellent architecture in the past, artificial and mechanical aids to the proportioning of buildings were sometimes actually used, and even more often consonant with the designs executed.

How is our present-day student and practitioner of architecture to attain that element of proportion so vitally important? Is he to regulate his conceptions by modules and minutes, or by the aid of the Egyptian triangle? Of necessity our modern buildings are very rarely of the simplicity in form that characterised a Greek temple, a mediæval cathedral, or an Italian palazzo, and any attempt to design, say, a modern municipal building on a restricted and irregular site by a rigid adherence to accepted canons of ratios, would involve such an overwhelming amount of drudgery as would inevitably damp all enthusiasm and quench all imagination in the designer, and hence for our purposes and requirements "such rules are," as Mr. STOKES said, "apt to give us commonplace and lifeless results."

But if the student is to dispense with rules and canons, he must find some substitute that will enable him to produce designs in architecture that will possess right proportions. This substitute should be such a training as will ensure his eyes and judgment doing their work properly. For this purpose it is essential that the early study of a student should be restricted to such ancient buildings as are acknowledged examples of good proportion. The selection of these should be the care of his teachers and masters, for as his own judgment is not yet formed, he must be content to rely upon that of others already rightly trained.

Herein lies the value of the atelier method of instruction for the young architectural student and of a preliminary grounding in the study of Greek architecture and the Orders. This should precede any work in the office of a practising architect where the exigencies of business may lead, as they often do, to the production of buildings destitute of a fine sense of proportion. The greatest restraint should be exercised by a student in the selection for himself of buildings to be studied by sketching and measuring, and in this respect the warning given to travelling students by Mr. STOKES was of high importance. The judgment or sense of fine proportion on which an architectural student must rely in his future career, is an extremely sensitive plant, the fair growth of which may be readily twisted or distorted.

For example, the Renaissance work of Germany and of our own Elizabethan and Stuart periods should be shunned

like poison, whilst Greek or French work may almost always be regarded as safe from the acutely developed intuitive rightness of judgment or taste that is their usual characteristic. Examples of Italian Renaissance architecture should be selected with caution, and in the case of young students under competent advice. By thus training himself in the feeling for right proportions, the student will educate his eye and judgment to a sub-conscious exercise which will enable him, in his future work, to dispense with rules.

Another subject on which the President touched is one of some sadness—the failure of brilliant students and prize-winners to carry out in their subsequent career the promise of their early successes. The causes of this are probably numerous and divergent. On the one hand there is the detrimental effect of precocity on mental development, an effect that is not confined to architecture but is common to many other spheres of trained intelligence. The Royal Institute of British Architects is not alone in the possession of a list of prize-winners who have not, in their later life, maintained the position gained amongst their contemporaries. The Royal Academy Schools of Painting and Sculpture and the Universities can show an equal, if not greater, percentage of mediocrities and even of nonentities in their rolls of brilliant students.

The profession of architecture is particularly encumbered with influences tending to deaden the artistic powers of its members. The necessity for earning a living often requires a devotion to dilapidations and drains that is hardly compatible with a fine sense of proportion or fecundity of imagination, whilst the ordinary business transactions inevitable to the realisation in bricks and mortar of the prize-winner's early designs when he commences practice for himself may readily have a paralysing effect upon his development as an artist. Hence, he should continue to study in order to maintain in their fullest capacity his judgment and his imagination. Above all, he should never allow himself to be tempted with the idea that because he has already achieved some success, he can rest on his laurels and be content with the ability he has acquired. Stagnation is death to the artist. Progress is indispensable not only to his development, but to the maintenance of his powers.

THE ARCHITECT'S STUDENTS' SKETCHING AND MEASURING CLUB.

WE are pleased to welcome this month several new workers in the Club, and we trust that they will continue to contribute with regularity, and so gain knowledge and experience even although on their first essay they are not fortunate enough to obtain a prize.

Mr. KENNETH W. LUCK sends a drawing of the font at St. Andrew's Church, Gorleston-on-Sea, which has been so seriously defaced by the notorious DOWSING as to be scarcely worth measuring. Mr. LUCK has made the mistake of giving us a perspective sketch instead of the measured drawings asked for in the conditions. He must remember in future that by measured drawings are meant plans, elevations and sections, with detail drawn geometrically to scale. The defaced and mutilated condition of the example he has selected has tempted this gentleman to a post-Impressionist manner of drawing which is not desirable in the representation of architecture.

Mr. W. E. CHADWICK has also made the mistake of sending a perspective drawing which is not correctly to be described as measured because a few dimensions are figured. His subject is a tub font with carved oak cover from the church of St. Mary Steps, Exeter, worthy of a more careful study and better drawing. Mr. CHADWICK should avoid blacking in solid part of the plane surfaces he represents in a sketch or drawing, which only creates a false effect. Mr. CHADWICK has also sent perspective sketches of the Bishop's Throne and Sedilia at Exeter Cathedral, subjects that are rather beyond his powers at present, with their wealth of intricate tracery and carving.

He should try simpler things to begin with, and make thorough and painstaking studies to a large scale before tackling intricate and difficult subjects to a small one.

Mr. T. OWEN THIRTLE has measured and drawn the font and cover at the church of St. Michael at Plea, Norwich, of which the font is an example of a type common in East Anglia in the fifteenth century and the cover is an interesting piece of seventeenth century work. Mr. THIRTLE has done his work well, but more details are wanted to make it complete.

Mr. CHARLES S. CARTER has made a study of the magnificent cover and good font at Ufford Church, Suffolk, one of the finest examples remaining of the Perpendicular period. Mr. CARTER has quite rightly drawn plans of the cover at different levels, but to fully understand the composition of such an intricate piece of work it is necessary that plans of all the stages should be drawn one over the other, so that the changes of form and relative dependency of the parts should be readily grasped. More details are desirable to complete the study.

Mr. E. H. GIBSON has selected his example from the church of St. John Baptist, Knaresborough, where a fine example of a seventeenth-century cover surmounts a rather poor fifteenth-century font.

"Le Quayt" sends a good drawing of a sixteenth-century cover on an Early English tub font in Bolton Percy Church, Yorkshire. The cover is more curious than beautiful, with its quasi-Perpendicular traceried panels modified by the Renaissance feeling.

"Sans Peur" also contributes a sixteenth-century cover, which surmounts a font of later date. These are from the church of St. John, Newcastle-on-Tyne. The cover shows the lingering of the Gothic tradition in its form, though the details are influenced by the new spirit of the time. The author sends a perspective sketch as well as good measured drawings, but although we are pleased to see it, we have not allowed this fact to influence our decision as to the prize.

We have decided to divide the prize this month equally between Mr. E. H. GIBSON and "Sans Peur," nearest to whom in merit come Mr. CHARLES S. CARTER and "Le Quayt."

NOTES AND COMMENTS.

WE are desired to express to our readers the regret of the Publisher for any inconvenience they may have suffered by the appearance of part of our last week's issue some few hours later than usual. The delay was occasioned by injury to some of Messrs. Spottiswoode & Co.'s machines.

As our readers are no doubt aware our printers are in the thick of the dispute between masters and men in the printing trade and we trust that forgiveness will be extended for any shortcomings in *The Architect* during the strike. We recognise that the men have a perfect right to demand shorter hours or more pay and to strike, but on the other hand the masters have an equal right to refuse the conditions demanded. Then comes the fight wherein lock-outs, strikes and peaceful picketting are legitimate weapons, and we hope to see a fair and square contest notwithstanding that we realise that the customers of Messrs. Spottiswoode, ourselves and others, are likely to be inconvenienced although we are not directly engaged in the unfortunate dispute.

THE Town Hall Committee of Newcastle Corporation have under consideration a report by the City Property Surveyor, Mr. F. H. Holford, upon the proposed re-arrangement of the Hall. The report embraces three schemes. The first does not bring within its compass the Concert Room, and the estimated cost is 21,653*l.*; the second includes the absorption of the Concert Room for municipal purposes, and the estimated cost is 27,129*l.*; whilst the third plan of alteration provides that about a third of the Corn Exchange be absorbed for offices, &c., and is estimated to cost 15,581*l.*

DEVON AND EXETER ARCHITECTURAL SOCIETY.

THE Annual Meeting of the Members of the Devon and Exeter Architectural Society (embracing the counties of Devon and Cornwall) was held at the Central Hotel, Lookyer Street, Plymouth, on the 28th ult., the President, Mr. William H. May, M.S.A. (of Plymouth), being in the Chair, and among those present were Messrs. J. Crocker, John M. Pinn, J. Jerman, J. A. Lucas, C. Cole (Vice-President), Harbottle Reed, E. F. Hooper, B. H. Palmer (Exeter), A. S. Parker, C. King, R. H. Arthur, H. L. Thornely, E. W. Lister, H. Watts, R. A. Mill, Lister, junr., B. P. Shires, E. Coath Adams, J. S. B. Ward (Plymouth), C. Cheverton, E. M. Leest, J.P., A. J. Adams, C. H. Phillips, A. G. Smith, C. H. L. Varcoe (Devonport), Sampson Hill (Redruth), and Allan J. Pinn (Hon. Secretary).

The Hon. Secretary presented the Annual Report.

The balance sheet presented by the Hon. Treasurer (Mr. S. Dobell) was of a satisfactory character and with the Report, was unanimously adopted.

The retiring President, Mr. W. H. May, then delivered the following address :

Gentlemen,—In the few remarks that I shall make I wish first of all to touch on sundry items referred to in the report.

Concerning the library, do members fully realise the value of this asset? Comparatively few books are taken out and I need not say that we have some excellent works that should be studied by students, and the Council is always anxious to obtain reference works of interest to the members if they will state what they require.

The younger members—and we have several—do not show the enterprise they should in availing themselves of the privileges that the Society offers: no drawings have been sent in this year for the book prize. I sincerely hope that during the coming year a greater desire to study will be manifested and that there will be keen competition for the prize, which is well worth winning.

It cannot be long now before our turn will come to have a seat on the Council of the Royal Institute. When it does I trust our representative will be firm and outspoken, as I feel sure the difficulties that beset us down in the West are not always realised sufficiently by that august body. Our members being so scattered throughout the two counties of Devon and Cornwall, the difficulties of successfully organising a meeting at our headquarters that can be largely attended are almost insuperable. The desirability of occasionally holding meetings in other towns apart from Exeter is, I think, a question that should be carefully considered by the Council, as I have noticed that under our present arrangement only Exeter members as a rule are able to attend these gatherings. It is to be hoped that interest in our society will be maintained and strengthened throughout the coming year, and that members will not be reticent in coming forward and expressing their views on all matters relating to our profession. Papers are always welcomed and discussions encouraged.

The past year has fortunately never been surpassed by coincidences so detrimental to the revival of architectural and building matters. Two general elections and the death of King Edward VII. are in themselves sufficiently serious, but coupled with the stagnation that existed in the building trade at the beginning of last year it is impossible to expect a better state of affairs to that which exists.

Whether the storm is over and a calm is setting in it is difficult to say at present. There are welcome rumours that the general trade of the country is improving; but, as it is a recognised fact that the building trade is the last to feel the beneficial influence of such a movement, it is more than probable that the day is still far distant when we in the West will realise the looked-for improvement.

Among the builders who tender for us there appears to be an almost unhealthy keenness in the competition for the comparatively small amount of work about, often causing them to overlook the conditions of contract and rely on variations, omissions, and extras to make the job pay, which, one need hardly say, are usually futile. The struggle for existence among some of them must be very severe, and many good men have been brought very low.

Good work, which is the cheapest in the long run, cannot be assured when the builder finds he has priced his quantities in a manner that will not pay him, and we cannot therefore be too careful in advising clients on the acceptance of tenders.

The dearth of architectural schemes during the past year is unsurpassed; but it is to be hoped that, with the Coronation of King George V., a stimulus for improvements and developments will be aroused and that my successor in the Chair will have the opportunity of retrospectively enlarging at our next Annual Meeting on a materially improved state of affairs.

As regards registration, what has been done? Little or nothing. The Royal Institute is on the active tout for the new Licentiate class which is to increase its numerical strength—to say nothing of its funds—and enable it to obtain a Registration Bill. Let us wait and see.

From my own point of view I cannot believe that any English Government will sanction so one-sided a measure. The Bill must be universal, and why the Institute should ignore other established societies is only known to itself.

Certain remarks have been made recently in the professional papers to the effect that the Royal Institute has approached the Society of Architects concerning the proposed Bill. If such is the case—and at present there is no official confirmatory statement—it is a movement that will materially strengthen the cause, and I am of opinion that united we shall stand and hold our own, but divided we are bound to fall.

I have already reported on the Town Planning Conference, the greatest movement for the year and one that should be of unrivalled benefit to the nation. The thanks of all are due to the Royal Institute for its success.

I must not pass from this topic without referring to certain monstrosities that have been illustrated in some of the West of England papers of late concerning suggestions for town improvements. We all appreciate and realise the good the Press can do in such a cause, but to give publicity to such lamentable productions of ignorance and inability is, to put it mildly, a mistaken kindness. It is earnestly to be hoped that in the future competent advice will be taken before giving prominence to such so-called architectural schemes.

The great question of copyright in architecture has occupied a prominent position during the past year, and one of the most antagonistic views to be overcome is that of Mr. Justice Scrutton, who, on appending his signature to the report of Lord Gorell's Committee, made a reservation to the effect that he could not concur in the inclusion of architecture among the protected acts owing to the difficulties he foresaw in the trial of what are new and original features and the remedies for infringement.

A great difficulty in this much-vexed question is the apparent impossibility of making legal authorities understand what an architect is and what are his claims to legal recognition and protection. Registration will, of course, be of the greatest assistance on this point.

The Royal Institute Committee has given most careful attention to the Copyright Bill, and it is to be reasonably surmised that at some future date, when either in this Parliament or some other the Bill is again heard, the action of the Royal Institute will not be disregarded.

During the past year, when in Belgium, I visited one of its great centres of the manufacture of cement, and, my interest being so aroused at seeing such large quantities being prepared for the English market, I made with assistance the following general observations, which I hope may be of interest to the members. We are all aware that this material is often used in England and, unfortunately, substituted for English material under the misnomer of Portland cement. Much of it that has been sold in England is composed of a mixture of natural cement and ground stone or sand, with a small percentage of artificial cement to assist its passing certain tests. The Belgian natural cement is just the rock, as quarried, burnt in a kiln, the same as ordinary lime, and then ground.

The following is an analysis of good English Portland side by side with that of Belgium as imported into this country; but whereas the analysis of the English cement is one which may be taken as constant to, say, one make of cement, with the Belgium cement, owing to the varying nature of the material, it is difficult to find any two analyses alike.

	Belgian.	English.
	Per cent.	Per cent.
Insoluble matter	6.02	1.44
Silica	21.50	22.10
Iron	1.99	2.70
Alumina	4.75	7.98
Lime	56.93	61.00
Magnesia	1.36	.98
Sulphuric acid	1.21	1.65
Volatile matter	4.40	1.78
Alkalies and undetermined matter	1.84	.37

The average tensile strains obtained from a number of Belgian cement tests are as follows, viz. :—

After 7 days, 335 lbs. per square inch.	
„ 28 „ 475 „ „ „ „	
But a good brand of English cement will give :	
After 7 days 650 lbs. per square inch.	
„ 28 „ 750 „ „ „ „	
and when mixed with three parts sand :	
After 7 days 350 lbs. per square inch.	
„ 28 „ 450 „ „ „ „	

And this latter you will notice is practically equal to the tensile strain obtained with neat Belgian cement, so this reasonably shows that English is not only a much superior article, but, if properly handled, more economical.

The causes of the inferiority of Belgian cement are due to the uncertainty of the quality of the stone quarried and the method of burning. Some pieces of the rock quarried are identical in composition with Portland cement, while other pieces have only the composition of hydraulic lime; and owing to this variation in composition of the raw materials they are burned lightly, so that the underlined portions are not fused to a slag and the overlimed portions are altogether too lightly burned.

In conclusion, gentlemen, I thank you most heartily for the confidence you have placed in me in electing me your President for two years in succession, and I relinquish the reins of office hoping I have given satisfaction and with the knowledge that I have endeavoured to do my duty and maintain the dignity of the profession.

Mr. James Jerman proposed a vote of thanks to the retiring President for his excellent address and also for his valuable and untiring services in presiding over the Society during the past year, which was seconded by Mr. John M. Pinn, supported by Mr. B. P. Shires, and carried by acclamation.

The President, Mr. W. H. May, suitably replied.

The following Officers and Council were elected to fill the vacancies of those retiring:

Mr. James Jerman, F.R.I.B.A. (Exeter), President.

Mr. E. Coath Adams, M.S.A. (Plymouth), Vice-President.

Messrs. H. L. Thornely, F.R.I.B.A. (Plymouth); Sampson Hill (Redruth); H. Watts, A.R.I.B.A. (Plymouth); Mr. S. Dobell (Exeter), Hon. Treasurer; and Mr. Allan J. Pinn, A.R.I.B.A. (Exeter), Hon. Secretary.

The newly elected President, in taking the Chair, expressed his gratification at having been elected President of the Society, and assured the Members that nothing should be wanting on his part to further the best interests of the profession as well as of the Society.

A cordial vote of thanks was accorded to the Hon. Treasurer (Mr. S. Dobell) and to the Hon. Secretary (Mr. A. J. Pinn), the retiring President emphasising the devoted work of the latter for many years.

The meeting concluded with a luncheon (at which the majority of the members remained to support the new President,) followed by a short toast list.

UNIVERSITY OF LONDON LECTURES ON ARCHITECTURE.

THE Thermæ of the Romans derived their origin as well as their name from the Greeks.

These stupendous buildings formed the sole subject of Mr. Banister Fletcher's lecture on Roman Architecture at the British Museum on January 24.

The palaestra of the Greek athletes had baths, and swimming baths attached to them, as well as libraries, exedrae for lectures and practice grounds; the Romans borrowed the whole idea, developing it on an enormous scale, lavishing alike on structure and ornamentation all the skill and magnificence of their science and art.

The bath was the general meeting place for the Roman citizen, answering in some respects to the modern club. Here was a centre for the dissemination of news in a time when the daily paper did not exist. Athletic sports, races, &c., took place in the grounds, for which high stands were erected, and lectures were delivered from the various exedrae and halls; there were also libraries and reading rooms for those who wished to study. A very small fee, one quadrans, equal to about a farthing was made for admission by the Emperors who wished to ingratiate themselves with the people. This fee was paid to the balneatores who were in charge of the baths. The management was entrusted to the aediles, the magistrates of Rome, who also looked after all public buildings, games, markets, &c. A large staff of attendants and slaves served the baths: the janitor, or door-keeper; the capsarius, who looked after the bather's clothes; the unctor and reunctor, who anointed with oil; the barber, shampooer, and many others, together with the slaves for the furnaces, these in all numbered some hundreds.

In the time of the early Christians the baths were held in disrepute owing to the unbounded license allowed, and in the fifth century they fell into decay, the aqueducts which fed them having been destroyed by the Huns.

It was not until the beginning of the sixteenth century that the Baths of Titus were excavated, but the best preserved are those of Caracalla, which covered an area of 25½ acres, the whole of which was raised on massive substructures about 20 feet high; the north-eastern portion contained the central block or baths

proper. This block measured 750 feet by 380, about equal to Westminster Palace, including Westminster Hall.

A colonnade surrounded the whole of the north-east side of the platform, the ground level being probably occupied by shops, as small vaulted chambers, two storeys in height remain, the upper storey on the platform level in all likelihood being used as slipper baths. There was only one main entrance, on the north-eastern façade leading into the grounds. These were laid out for athletic sports, the south-western portion being a Stadium, on either side of which were two hemicycles, encircled by a colonnade. These hemi-cycles each contained three halls; one on either side was a swimming bath, the others were used for dramatic representations or as lecture theatres for philosophers, rhetoricians, &c. One of these halls, square on plan, shows an interesting example of the early use of the pendentive. The square is brought to an octagon, over which is placed a dome on pendentives.

At the south-western extremity were the immense reservoirs and furnaces which supplied the baths, fed by the Aqua Marcia, which was carried by the aqueduct that Caracalla built.

The water was stored in sixty-four vaulted chambers, two storeys deep and two storeys in height, each chamber measuring 50 feet long by 28 feet wide and 30 feet high. Through these the water flowed, was filtered, and became heated by a system of furnaces below, together with hypocaust floors and flue-tiles which surrounded the whole wall surface of the tanks. It was thence transferred underground to the baths through the substructure of the platform in leaden pipes, a distance of some 500 feet.

(To be continued.)

ILLUSTRATIONS.

SANCTUARY PANEL PAINTINGS ST. MARK, LEICESTER.

THESE paintings cover an area of 800 square feet, i.e., all the interior measurement of the seven large panels in the apse at the east end of St. Mark's Church. These are painted upon canvas (affixed to the walls) and are the gift of Mrs. Perry-Herrick, of Beau Manor, Leicestershire. The artist is J. Eadie Reid, Esq., of Paris and Gateshead-on-Tyne. The panels were dedicated "To the Glory of God, the honour of St. Mark, and in memory of William Perry-Herrick, and Mary Ann, his sister, Founders of this Church."

The theme of the paintings is "The Triumph and Apotheosis of Labour," an aspect of our Redemption in Christ.

The Church of St. Mark, Leicester, stands in a town of 244,255 souls (1909 estimate), of whom the greater number belong to what are termed the "working classes." St. Mark's is one of the chief working-class parishes of the town, and contains (1909) towards 15,000 souls.

In this parish there is represented all the tragedy and pathos, shame and horror of modern social conditions—infant mortality, child labour, under-payment or sweating of men and women, decadence of physical life, consumption, premature death, and a general low vitality, together with an almost complete absence of beauty and a dire lack of the graciousness and glory of life.

Therefore, in any scheme or design for decorating the sanctuary—the Holy of Holies—of this people's church there should be depicted (1) not merely Cherubim and Seraphim; (2) nor upon the other hand, merely the realism of the people's life—furnaces, factories, machinery, and physical poverty with its results—but rather there shall be depicted or symbolised:—

1. The Travail and Tragedy of Labour; by which phrase is meant the suffering of the proletariat or "working classes" pre-eminently but not only. For the travail and tragedy of Labour is part of the "fallen" state of our whole race, and not of individuals or of classes only. This tragedy affects the proletariat chiefly so far as poverty is concerned, but it affects and degrades all Labour whatsoever—working men, working women, and children, artists and art, worship and the priesthood, merchants and commerce, scholars and physicians, prince and peasant—for all and everything are marred by the organisation of society as we know it.

2. The Curse of Mammon.—The root cause of this travail and tragedy of labour is the organisation of society and commerce for the pursuit of riches, not for service and for good; for mammon and gold, and not for God. The lust of gold is the ultimate source of almost every industrial horror. "The love of money is a root of all evil." The Divine Pity

sees this—the tragedy and its cause—and therefore He reveals His mind and will in the Christ—the New Man—who demonstrates that Labour, like all human life, can be redeemed by love, and by love alone.

3. This Redemption of Labour by Love can be effected only by sacrifice. For love must penetrate the depths of this hell, to purge it and transform it. The element of suffering is already there—involuntary, brutally enforced, hopelessly endured. Love, though it sees, nay because it sees this horror and knows this shame, submits to enter therein, to transform the evil by good, until at last labour becomes what God intended—a free service of fraternity, rather than a repulsive, hateful task, enforced by the lash of the whip, or by the cruel spur of “competition” instigated by the lust of gold or by the pang of hunger.

Thus at last—through love and fraternity, realised in the re-ordering of society—labour, freed from its shackles, stands forth noble, upright, beneficent, glorious.

4. This Liberated Labour renders a Free Service and a Pure Offering of which alone can be said, “Work is Worship”—“Laborare est Orare.”

Then, and only then, is the life of labour “of” the kingdom of God—part of it, interwoven with it, consecrated and strengthened by it, one with it—when organised society, accepting industry and labour as spheres of brotherhood, build therein the altars of love in Christ. Then, and only then, will it be true for us, as once it was for the apostolic Christians, “neither were there any that lacked;” then, and only then, will excessive riches on one side, and attenuated poverty on the other, with all their tribe of attendant evils, pass away, and there shall be a divine community, the city of God, and the brotherhood of man.

5. This will be the Triumph of Labour; not merely of the proletariat, and of the manual crafts, but of the liberal arts; for all shall be one in Christ Jesus, Who at length shall reign in industry, as in His Church, over all supreme, and to Whom every kind of labourer (each in his vocation and ministry) shall render homage, making of his work a pure offering of fellowship and love, unto Him Who is Himself the

6. Apotheosis of Labour, the Lord of life and love—even Christ.

The following is the description of the carrying out of the theme written by the Vicar, Rev. F. Lewis Donaldson, after consultation with the painter, Mr. J. Eadie Reid:

I.

The general idea of the two outermost panels (i.e., the one on the extreme left and the one on the extreme right). In these Labour is suffering under tyranny and oppression, and is in travail and sorrow. There is but little looking upward, and gloom and despair prevail; though, even so, some faces are turning towards the light, a symbol of the beginning of redemption and reform.

The panel on the extreme right. In this, Labour is seen either carrying massive material or dragging some unseen weight, without hope or expectation, with bowed head and back. No face can be discerned looking upward, but all seem absorbed in the mere burden of existence. In the foreground is the figure of a fallen man symbolising Labour overwhelmed by its burden. The quiet, watchful figure above represents Mammon, oblivious to all but his own personal aggrandisement; bags of money are on his lap, and a grim callousness to the pain around him is expressed in his countenance and bearing. The dim figure of a woman in front symbolises Luxury in attendance upon her master, Mammon. Overhead is the Angel of Sorrow, bearing the globe of destiny, which is opaque, and in which, therefore, it is hard to read man's destiny. But a close scrutiny reveals a dim gleam which signifies, even under such conditions, hope of good to come.

Panel on the extreme left. In this panel, poverty, pain, and sorrow are shown in various figures, viz., in mother and child, father and daughter, husband and wife. In the extreme left corner a man is sitting, bruised and broken. He sees no hope, and contemplates nothing but death. A mother is striving to direct a young girl, her daughter, towards the light. A woman is trying to help forward a poor wretch, fallen and bandaged—her father. On the right is the kneeling figure of a man, his hands covering his face, weeping with bitter grief. Near him is a strong man, with uplifted hands, cursing his fate, while his wife tries to restrain and comfort him. Behind, to the left, is a figure representing old age in its weariness and pain. Two men standing higher up on the extreme left symbolise ancient Philosophy, contemplating abstract wisdom, but unable to initiate, or even formulate what is needed for reform, and expending itself

in fruitless speculation. In the distance, in this and other panels, the ever moving and necessary current of human life and labour can be seen. Men are stripped for oppressive labour with molten metals. The general conditions are bad, and yet, even so, a few faces are beginning to turn towards the source of light and of redemption. The dim figure at the side of this picture symbolises current society—cold and remote, careless, indifferent, and blind to the tragedy of Labour's lot. Above all is the figure of the angel of sorrow with the globe of destiny, in which, though opaque and mysterious, a close scrutiny reveals a gleam of light, symbolic of good to come.

II.

The general idea of the second panel from extreme left and second panel from extreme right. In these two paintings the redemption of Labour is proceeding. Love is developing fellowship and union, and is raising the conditions of earthly toil. Men and women may be seen earnestly assisting one another, and the general movement is upward, and faces are more generally turned towards the “Strong Son of God, Immortal Love,” Who is the source of the redeeming power.

The second panel from extreme left. The redemption of Labour is symbolised in this picture by a woman, outcast, neglected and scorned, who is being lifted up by others. Her rescuers (a woman leader with her co-worker in redemption) are directing her attention to the Christ, and her face is turned as if towards Him, from Whom the light suffuses her countenance. In the foreground is the figure of a young man tortured by doubt, worn by privation, but struggling against the prevalent conditions of society. Next to him is a strong man in the prime of life, capable of full enjoyment of labour and striving to break the bonds which bind him, so that he too may move toward the light. Next to him is a man, old and worn, his life spent, yet feeling that something still is lying in the beyond, and that the promise given has not been a vain one, and is still worthy of his faith. At the extreme right is the figure of a man who has grown hopeful of good, and is looking earnestly towards the source of all good. The prominent figure in this panel and the equivalent figure in the corresponding panel on the right represent the guides or leaders of men, of whatever kind, who are striving to enlighten their brethren, and to unite individuals and classes in the common effort of redemption.

The second panel on extreme right. The prominent figure symbolises those who lead or teach or unite mankind. A husband and wife are coming forward, signifying the redemption of family life. In the foreground are a miner, a shepherd and an agriculturist, representatives of three great departments of man's activity. Throughout this painting the idea of inspiration drawn from the Faith of Christ is symbolised by the upturned faces and the general attitude and tendency of the figures depicted. In the background, the struggle of Labour with unrighteous conditions of life is still proceeding, but the general effect of the symbolism of this painting, and of the corresponding one on the opposite side, gives the impression of Faith, Hope and Love, with a corresponding progress towards good and God.

III.

General idea of the two panels next to the centre. These represent the triumph of Labour, redeemed by Love, and able now to offer to the Lord of Love a free service and a pure offering in fellowship one with another, and with Him.

The panel on the left of the centre. Sculpture, as representing the plastic art, is symbolised by a man holding the model of a figure which is kneeling in devotion. Next to him is the author and student with his book, symbolising knowledge. The craftsman stands in the pride of physical energy, symbolising all the workers in the materials which the earth yields. He represents all the manual crafts. A man holding the model of a ship symbolises the conquest of the sea, and labourers of all kinds, who “go down to the sea in ships.” The woman worker engaged in the daily round and common task yet finds a glory, reflected from the Christ, in what may seem merely menial, but is really essential to the happiness of mankind. This figure, and others in the paintings, represent the millions of women engaged in industry throughout the world. Close by the woman, and on the common platform of mankind, is the king or ruler, signifying “principalities and powers,” and the labour of government. He stands crown in hand, acknowledging the homage due to the source of all authority, even Christ. The lowest figure here is the schoolmaster, as if to symbolise the fact that in the training of the young lies the foundation of every art and craft. This idea is balanced, in the corresponding panel on the right of the centre, by the figure of a mother and her

child. The mother and the teacher are the first in the education of mankind.

The upper part of this panel and of the next on the right of the centre represent the twelve apostles as sharers in the glory of their Lord. Other painters have beautifully depicted this glory by aureole of Cherubim. Here it is depicted rather by the first-fruits of His Kingdom, the workers of Galilee.

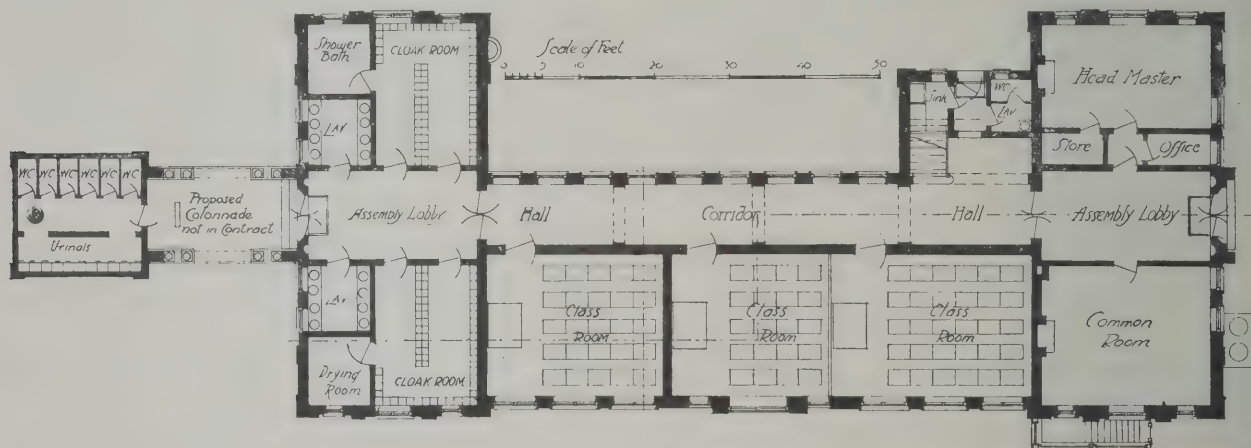

The panel on the right of centre. An architect offers his work, symbolised by the model of a church. By his side is the builder who, with the architect, symbolise all the arts and crafts of building. The next figure is that of a woman, representing the life of thought and culture. The glory of maternity and its service for God and man is symbolised by the figures of a mother and her babe. The liberal arts, painting and music, are shown expressing themselves through instruments of colour or form, endeavouring to translate the message they are receiving from the Eternal Word.

IV.

The centre panel. The Christ as the Apotheosis or Deification of Labour. Our Lord is represented as the source of

COUNTY BOYS' SCHOOL, MAIDENHEAD.

THIS design for the Maidenhead Secondary School for Boys was awarded the first premium in open competition, in which 145 designs were submitted to the assessor, Mr. R. S. Wornum, F.R.I.B.A. The school has recently been opened. It is erected on a site of four acres, on high ground overlooking the town, and provides accommodation for 150 boys. The plan is arranged so that further additions could be easily and economically added without disturbing the working of the school, or interfering with the general scheme of the design. The design of the building is an adaption of Georgian architecture, executed in red bricks of varying shades, relieved in its central parts by stone sparingly employed and roofed with red sand faced tiles. The school is planned on two storeys with all departments under one roof. Both floors have through corridors practically running from end to end. On the first floor is a spacious assembly hall, which is used as an art room also. The corridors are divided in their lengths by a series of arches and the floor paved with jointless flooring of a deep red colour, and the dadoes are formed of glazed bricks of a light golden green colour, with two narrow rows of small tiles to match of a neat design.

FIRST FLOOR PLAN.

COUNTY BOYS' SCHOOL, MAIDENHEAD.

GROUND FLOOR PLAN.

Light, and Life, and Love. He stands in an attitude of majesty, with uplifted arms, suggesting partly command, partly appeal, invitation and encouragement—"Come unto Me all ye that travail, and are heavy laden, and I will refresh you." And again, "My Father worketh hitherto, and I work." Behind the uplifted hands, and through the æther, shines the symbol of the cross, and the mark of His suffering may be traced in the sacred hands. He appears as the Co-worker, and Inspirer of all service in the travail or labour of mankind, as the One in Whom men realise that work is not merely a medium of fame or gain, but is in itself worship, and a return of the gift or talent which has been reposed in them, and which are a means of fulfilling the eternal purpose of God. Each act and every service, however humble, are potent to aid the divine purpose, if done in fellowship and good-will. In the picture the Christ is represented as coming with the glory of the dawn of the true life of mankind, while the Cross, glowing in the light of "the day of the Lord," symbolises the triumph of Labour, consummated through sacrifice, fellowship and love.

The heating and ventilation installation has been carried out by Messrs. Rosser & Russell, fireproof floors by Messrs. Homan & Rodgers, gas lighting and fittings by Messrs. Christie. The stone carving and plaster modelling in hall and also the principal rain-water heads are by the Bromsgrove Guild of Handicraft. The leaded glass work, entrance gates and metal works by Messrs. Humphries Jackson & Ambler. The furnishing is by the Educational Supply Co. to designs supplied by the architect. Fencing by Messrs. E. C. White, of Basingstoke.

The architect is Mr. A. Jessop Hardwick, F.R.I.B.A., and the contractor Mr. J. B. Seward, of Wokingham. The building was superintended by Mr. R. Squelch, acting as clerk of the works.

OXFORD COLLEGE SERIES—CHRIST CHURCH.

CONTINUING our series of views of Christ Church College we this week give illustrations of The Library and Peckwater Quad.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AT the conclusion of the Presidential Address at the Royal Institute on January 30 the following criticism of the drawings and other work submitted for the Institute's Prizes and Studentships was read by Professor C. H. Reilly, M.A., of the School of Architecture, Liverpool University:—

Mr. President, Ladies and Gentlemen,—To be asked by my fellow-members of the Council to join the band of those who have delivered this annual criticism is no small honour, and at the same time no small responsibility. There is a responsibility both to the Institute and to the competitors, and I trust that neither will resent anything I may say in my position of candid friend of both. For I feel very strongly that the exhibition before us in its broadest aspects is the best indication we have of the general state of architectural thought among the younger generation. Students' work, at any rate in England, follows very closely—much too closely, I venture to say—the trend of current architectural taste, and whether an exercise be supposed to be in the principles of Palladio, Vignola, and Chambers or not, the result is generally a pretty faithful reflex of the latest competition devices of our competitively successful architects. In the absence of any national system of training in design it could hardly be otherwise. A year ago it was my good fortune to see in America the designs for the Stewardson scholarship, which holds there a similar place to our Soane medallion. The chief difference, as it strikes me now, was not that the best work was better, but that in the hundred or more designs submitted for this one prize the general level of accomplishment was considerably higher than it is here. Among our students we have evidence before us to-night of many men of brilliant imaginative power and great artistic ability, but they seem to lack that technical accomplishment in design, that knowledge of architectural effects and possibilities, which is necessary for ability fully to justify itself. But if the best men suffer from lack of continuous training in design, how much more do the lesser? Indeed, the main advantage of schools of design—the only modern equivalent to consistent architectural tradition—is that the general level is raised. Everyone has remarked that in a time of strong tradition like the eighteenth century how little absolutely bad work was done, and the same results apply to the organised teaching of design which every country save our own now possesses. Facility in design, like facility in draughtsmanship, comes with constant practice. I know myself what a good exercise I find it scribbling compositions or details on the students' boards at Liverpool.

This may all seem a digression from my main subject to-night, but it leads to this suggestion, that the Institute which has now taken in hand the training as well as the examining of students should make training in design the keystone of its system. History, mathematics, construction, materials, everything else, should be subsidiary to what after all is our main excuse for existence. Instead, therefore, of a couple of small designs and an elaborate system of written papers, I suggest the Institute should substitute a minimum of papers and a series of designs to which the Tite and Soane might be a fit culmination. As it is, I think the winners of these prizes might be allowed to qualify for membership just as the Prix de Rome, *ipso facto*, obtains for its holders the diplomas of the Ecole des Beaux-Arts.

Turning then to the Tite and Soane prizes, the competitions for them as exercises in design are naturally and rightly the ones to which we attach most importance. Sketches, measured drawings, essays, colour studies, valuable as they are as means of study, all pale in interest before a single honest attempt to evoke the noblest function of the human mind, its power of imaginative creation. Ultimately, all works of art must live by their appeal to the imagination; that is the divine fire without which the cleverest rendering, the deepest scholarship are but negative accomplishments. Now there could hardly have been chosen two subjects making a more immediate appeal to the imagination than those for this year's Soane and Tite prizes—a bridge and gateway to a capital city, and a wooded island in a lake set apart for the solemn rites of burial. They are ideal subjects, and our students—and all of us for the matter of that—should be encouraged to dream dreams; so-called English common sense and love of compromise will follow fast enough in practical office work.

The Tite Prize.

I think particularly in the Tite prize has the Committee's choice of problem been justified. Some tell me this is not such a strong year as certain previous ones. I have not always seen the drawings, and worse still have never been a competitor, so I cannot say. But whether it is up to the standard or not, I feel we need not despair of the future of our art when we have among us men of the poetical temperament of "Ek Thanatou Nikos," or capable designers like "Catafalque," "Apex," and the

winner. The jury must have had a very difficult task in determining the result. Having set so fine a subject, were they by their award to throw Palladio to the winds and choose irrespective of all else the most poetical conception—the design which satisfied the spirit rather than the letter of their problem? It must have been a sore temptation, but English common sense has won, as it generally does, and the very capable design of Mr. Foggitt, "F. 13," has been placed first. It is, indeed, the most Italian design sent in, Bramantesque in general character. Mr. Foggitt has also made more of the Italian idea of a Campo Santo than the other competitors. Cutting a great wedge out of his island he has contrived a broad sloping way up to his chapel, flanking it on either side with arcaded terraces set back one behind the other. At the head of the slope stands the finely composed façade of the chapel, the dome of which crowns the island. The unobtrusive perspective hardly does justice to this effective approach. Where Mr. Foggitt has failed, I think, is that the idea of a lonely island set apart for the solemn rites of burial is hardly conveyed by his pleasant scheme, which suggests rather a happy secluded convent building set among its terraced vines on some sunny Italian hillside. Mr. Foggitt's drawings are somewhat dirty in execution.

"Catafalque" (Mr. H. Boddington, junr., 10% 10s. and hon. mention), who is placed second, sends a much better set of drawings, *qua* drawings, than the winner. I commend his half-inch detail as an example of how Classical architecture should be drawn, with a quiet pencil or washed-ink line, and geometrically yet tenderly shaded. He has designed for his main building a temple-like structure with a finely conceived portico, and has wisely placed it, as the Greeks would have done, some little distance up the hillside, leaving the mountain behind to form a background. The interior of this building is particularly good. Half-way up his long sloping approaches, however, stand two octagonal pavilions for columbaria, and these are rather a blot on his scheme. They suggest to me both by their shape and detail garden pavilions rather than tombs. But the whole conception, if a little long for the island, is quiet and dignified, and the detail, except for one or two lapses, such as the archway with a broken cornice and the pediments without any tie in the Newgate-like niches, is good and expressive. The perspective is a very pleasant drawing, embodying well the quiet serenity of the design; the buildings are seen in silhouette against a setting sun near the water's edge reposing ready to welcome the advent of the happy dead. To me the whole idea of this design is more truly Classical in spirit than that of any other.

"Ek Thanatou Nikos" (Mr. W. G. Newton, hon. mention), if he has failed to win the prize, will win his victory from life itself. A man so sensitive to the poetical possibilities of his art will gain happiness, and pain too no doubt, from all he undertakes, but at any rate he will live a real life. His two perspective drawings have the solemnity and mystery of an early Maeterlinck drama. I think his main building, with its high enclosed atrium, has something of the remoteness—the dignity combined with simplicity—that we find in the best Greek work. He has justified his use of Greek detail, if any justification were needed, by a quotation from Chambers, "It should always be remembered that the stream is purest at the head." His detail, indeed, shows considerable scholarship, especially in the row of monuments in his niches, each differing in design. It is a pity they have been so carelessly drawn. Greek architecture calls for the purest, most delicate delineation. Besides his central building he has a quiet retired landing-place, and a little village set in a fold of the cliff, from which rises a circular stair to the headland on which he has placed his temple. All these are interesting and romantic features in themselves, but they are not bound together into one architectural design, and the reason for this is the shape of his island. The author has assumed the shape to be that of a skull. It is an interesting idea though a non-architectural one, but that would not matter so much had it not hampered his design. It is really akin in spirit to the triangular lodge at Rushton Manor to symbolise the Trinity, or John Thorpe's scheme for his own home in which the plan spelt I. T. It is a pity so clever a designer should have been carried away by such an idea.

"Apex" (Mr. V. O. Rees, hon. mention), to whom a certificate of honour has also been awarded, sends a very sensible set of sepia drawings, a little sloppy in finish due to their pencil line. Cockerell and our great Classic architects always used a thin ink line. "Apex" has absorbed the whole island in his scheme, but has handicapped himself in the eyes of the jury by levelling half of it to the water's edge to form an acropolis of the remainder. His architecture, however, is good and consistent in character, and he gets the fine effect of a processional way lined with monuments leading from his landing-place to the foot of his acropolis. What happens then is not quite clear, as no staircase is shown. Two hundred feet above though are a group of good

buildings surrounding a central hall modelled on the tepidarium of a Roman thermæ. The entrance to this has a couple of pylons with a colonnade between. It is here, as seen on the detail drawings, that the design is a little weak. After passing through a more or less Greek portico in-antis these pylons, reminiscent of the Grand Palais at Paris, strike a jarring note. I would recommend to "Apex," and, indeed, to all who do not know them, the collection of Ecole des Beaux-Arts drawings of the sixties, seventies, and eighties, published by the "Intime Club" of Paris, and called "Croquis d'Architecture." Here, among a certain amount of bad Gothic, you can dig out all sorts of monuments, to each of which the architects of the Greek Revival, from Garnier to Pascal, have given, what only Frenchmen seem able to do, the appropriate architectural expression. I found these drawings in use in each American school I visited.

Perhaps the schemes I have mentioned form the first class. The next, not far behind, would include "Red Diamond," "Charon," "Fate," "Naos," and "Catacomb." The first has the good general idea of using Greco-Egyptian detail for suggesting the attributes of death. He, too, has absorbed the whole island and crowned it with a monument. Although this structure is coarsely detailed, and the order even grotesque, I feel it possesses character, and character of an appropriate kind. One may be inclined to laugh, too, at "Red Diamond's" post-Impressionist perspective, but, like the pictures at the Grafton Gallery, a sense of its uncanny strength remains with you. "Red Diamond" will soon realise brutality is not the way to express power, and that perfect control and refinement of detail are its real complement, whether in a steam-hammer or in the Parthenon.

"Fate" crowns his island with a rather gay but well-drawn and well-detailed French dome carried on three terraces. His perspective is poor, but it is largely compensated for by the delicately drawn half-inch showing good knowledge of French eighteenth-century detail. It was a little unnecessary though to add French nursemaids and poodles to his main elevation.

"Charon" has placed a finely conceived Pantheon-like chapel on the apex of his island, but from want of time probably has not been able to finish his drawings. It is difficult to resist the feeling that he has employed his baby brother on the perspective. The poorest part of his design is the rococo terrace with vaults under it, forming docks for boats.

"Naos" has also some finely felt Greco Egyptian detail, highly suitable to the subject, if not according to Palladio, which is well and delicately drawn on the eighth-scale details, but poorly and clumsily on the half-inch. The general outline of his main building, with its reversed curve in the cupola, is weak. The plans, perspective, and elevations show traces of having been coloured at night.

"Catacomb" shows a building with four corner features and a dome, making a successful and thoroughly Italian composition. His general plan has not been worked out, but on his fine, if rather theatrical, perspective a good double circular staircase approach is seen, solemnly lined with cypresses. His detail is a little dull, though founded correctly enough on Chambers and Somerset House.

"No. L," has shown in a careful set of drawings a small Italian cathedral, with a circular arcade behind it. It is not quite in the grand manner, however, to line the processional way with a series of gardeners' cottages.

"Geometer" and "Gondolier" both try to fit elliptical colonnades to their building, after the manner popularised by Mr. Fulton in a previous competition. This is an example of the bad habit I referred to of relying on each other's washing for a living. "Gondolier" submits a design for his burial-ground full of light-hearted gaiety. You approach his casino-like chapel through a rococo portico from the White City, from which, too, his twin towers might have been borrowed. He is a clever draughtsman, though, and his perspective is one of the best in the room.

"Spero Meliora" will justify his motto. He shows in a good set of wash-drawings a rather dull town-hall-like building, with an Ionic pergola for a Campo Santo.

Lastly, "Dust and Ashes" has sent a little wash-and-pencil sketch perspective, in which the picturesque boatman we know of old—from copies in our first dame's school—is taking in his gondola two peasant ladies for a picnic in the cemetery. It is, as you can imagine, a charming early nineteenth-century water colour. "Amaryllis," on the other hand, shows all the soapy, bad effects which can be got by combining a heavy black line with colour. The detail, I am afraid, suggests terra-cotta and the music hall, in the shades of which, perhaps, this sort of Amaryllis was designed to sport.

[—] *The Soane Medallion.*

The Soane has not produced this year to my mind so good a competition as the Tite, either in numbers (12-19) or in the

general quality of the work, yet in these days of civic design an entrance to a capital city should have been an attractive subject.

"Civitas" has sent in a thoroughly Beaux-Arts set of drawings, even to the gold borders and the carefully composed frontispiece of details. The plans, sections, and elevations are all made things of interest in themselves. The draughtsmanship, if somewhat uneven, reaches in places a very high level indeed. The drawings are shaded throughout and made intelligible to laymen. In England we are wont to play up too much to the man who boasts he can never understand a plan, and I am sure the public appreciation of our art suffers in consequence.

"Mauerthor" has had an honourable mention given him for a clever essay in François Premier architecture. The Soane is not restricted—unfortunately, I think—to the fine Classical architecture practised by Soane and his contemporaries. It is therefore open to anyone to send in what the Americans would call an essay in archaeology, and in this case it has been done with American thoroughness. The main gable, well shown on the half-inch drawing, exhibits all the varying scales, the uncertain grasp of *motifs*, which characterises such early work when ideas which since have blossomed were only in the bud.

"SLab," who also receives honourable mention, submits a very modern design in the latest *Daily Mail* vernacular. The draughtsmanship of his geometrical drawings corresponds. It is the clever draughtsmanship of the competition expert. Neither in it nor in his design is there, however, any unity of idea. Both are full instead of clever slick touches. Indeed, "SLab" seems to me to be in danger of becoming the clever person whom our present want of system in teaching design leaves stranded. If he is not careful he will fall into Mr. Imre Kiralfy's hands, and design gateways for White, rather than Capital, Cities. But it will not be his fault. His perspective, which is full of colour and fine feeling, shows him to be by nature a genuine and considerable artist.

"Harlequin" has to my mind the most solidly architectural scheme and shows it in sensible sepia drawings. His perspective reveals the fact that he has not quite realised that his main proportions should start at the bridge, not at the water level. But for this fault—a cardinal one I admit—he might have received a different place.

"Black Cat" has laid out a fine circular *place* on the city side of his gateway which is approached by a miniature Waterloo Bridge of one short span. The *place* is half surrounded by arcades which look weak on plan. The main building is quiet and good except for a very broken attic over the entrance.

"Yellow Bird's" scheme, with a central feature somewhat reminiscent of Hyde Park Corner, is quietly drawn in rather an old-fashioned way which seems to suit his architecture. "Journey's End" meets you with a great pylon in which Assyrian, Classic, and Romanesque *motifs* are mixed but hardly blended. I wish his architecture were as good as his draughtsmanship. "Horatius" also sends a somewhat bastard design in which a Romanesque bridge leads to a tower with new art buttresses and Egyptian sphinxes crowned with an Ionic garden pavilion. "Jemador" at least has courage. He shows a building in buff terra-cotta.

The Grissell Prize.

The Grissell and Saxon Snell prizes are the only others offered for design. The Grissell is given for construction rather than pure form. The subject was a large skating rink to be built and roofed in wood. Unfortunately none of the competitors were adjudged worthy. "Oregon," whose building is quiet and satisfactory, has certainly attempted to design a novel form of roof. He has bifurcated his trusses above the hammer-beam, branching them on diagonal lines, which gives somewhat the effect of cross-vaulting, and at the same time braces the roof against wind pressure. If this roof would stand up—and I am assured by authorities it would not—it would certainly afford a striking and interesting interior. I think as an example of the "architecture of adventure" it deserves some credit. The drawings, too, are well made and the roof construction clearly explained. The remaining designs are not very happy.

The Saxon Snell prize has not been awarded.

Turning now to what I may call the research section of our prizes we come first to the Institute Silver Medal for measured drawings.

Measured Drawings Medal.

Seeing that the Pugin is worth 40*l.* and is devoted to mediæval work, I wish the Institute could see its way to increase this medal from 10*l.* to a like sum, and confine it to Classic and Renaissance architecture. Frankly what is wrong with a good deal of our Classical architecture to-day is that it is still too Gothic. Until we have devoted as much time to the study of Classic forms as our predecessors did and our Pugin enthusiasts do to-day to Gothic ones we shall not make headway. At the same time we should learn to draw them in a style suited to their

character. Classic architecture is an affair of light and shade rather than of line. It should be rendered therefore in light and shade, and the thick line drawing, which we owe to Burges should be kept, if kept at all, for Gothic work.

"Ethandun," the winner, has indeed sent shaded detail drawings of the Gothic building he has measured, and very well they look. His black line elevations are not so pleasing, and his surveys a little careless. The latter, however, are supplemented by many sheets of full sizes plotted on the spot, for which he deserves and has no doubt obtained great credit.

"Nihil sine labore" justifies his motto in the six strainers he has sent of St. Lawrence Jewry, a Classical building, but shown in the strongest of competition black lines. Strong as these drawings are, they are bound to have the defects of their qualities. The carving, well drawn, has a totally wrong value, and an enriched moulding in effect counts more than a whole column. But it is not on such a question "Nihil sine labore" has been judged. He has not submitted his surveys.

"Farnese," "Cam," and "Oxonian" all send rather tentative drawings, some in wash and some in line, and the surveys are not as good as they should be. "Farnese's" perspective of the much-measured Somerset House Strand entrance is a good piece of work.

The Pugin.

We come now to the Pugin, and a very difficult task it must have been to make the award. Some drawings are crisper, some more spotty, some water-colour drawings are cleaner than others, but beyond that what can one say? It is a matter more of craftsmanship and industry than anything else. Mr. J. B. F. Cowper, the winner, who is to be congratulated on winning the Ashpitel prize as well, is a hardworking north-countryman. He sends six good perspective sketches of towers and spires, three in line, three in colour. He has measured several parts of buildings in the special way Pugin students measure. He has, however, included among these latter the façade of some almshouses at Nantwich, which but for the date, 1638, one would imagine were modern artisan dwellings.

Mr. Hepworth sends in the most work, and in an elevation of the porches of Rouen Cathedral which he has measured maintains an extraordinary sharpness of pencil line. One cannot help wondering whether such laborious work is quite worth while, and whether the full-size detail of a single niche would not be more valuable than these hundreds of niches all drawn with the same staccato touch. Mr. Hepworth, though, has measured more than the other competitors, and this is to his credit. Personally I think one measured drawing is worth a very large number of sketches. It may sound heretical, but I cannot help thinking that sketching, in spite of the Pugin studentship, is by itself a very dangerous pastime. A man who has sketched the skyline of a building and a little detail over the door is apt to think he knows all about it. Perhaps the blight of picturesqueness which has settled on our architecture could be traced to the enthusiastic sketching of twenty years ago.

Mr. Clough has made a number of straightforward yet delicate drawings and some admirable colour sketches. He must have run the winner very close—whether behind or in front I need not say. Mr. Hadwen's shows evidence of a good deal of hard work, but his draughtsmanship is not very sympathetic. Mr. Alison sends good work too, but is a little uncertain in his details.

The Owen Jones Studentship.

The Owen Jones Studentship has produced two good sets of drawings by Mr. Bellis and Mr. Oakley. Perhaps Mr. Bellis, with his power of drawing the figure, is the stronger man. His drawing of the Pompeian decoration from the Castle of St. Angelo is particularly good. His colour though is not as good as his draughtsmanship, for some of his drawings suggest the reproductions in Mr. Owen Jones's book rather than the thing itself. Mr. Oakley is more daring than Mr. Bellis, in that he submits several sheets of original designs. Attempting more he has made a high failure rather than an easy success. His decoration often conflicts with the lines of his architecture, and I am afraid his panels would reduce his council chamber to a restaurant. To reconcile again great painting and great architecture is however the work of a giant, and no one in our time seems likely to accomplish it, unless it be Mr. Augustus John.

Arthur Cates Prize.

Mr. Henderson, who wins this prize, sends some charming sketches chiefly from Italy and a design for a Carnegie library. The latter, to my thinking, rather negatives the former. His best drawing is of Peruzzi's delightful Santa Maria Carcere at Prato. Why, I wonder, has Mr. Carnegie's personality ousted that of Peruzzi from Mr. Henderson's mind?

Mr. Vey's drawings are not so good, though perhaps his design

is better. Bay windows, however, running through several storeys are difficult things to harmonise with a really strong cornice.

The Institute Essay Medal.

The essays have been left to the last, not, however, because they are the least important. Indeed, of the research work the reverse is the case. The winning essay, Mr. Honeyman's, on the design and construction of belfry stages and towers, is a very valuable piece of real research work, showing throughout intimate first-hand study and a thorough knowledge of his subject. Although only two essays have been submitted, the winner's amply justifies the Council in changing the type of essay subject to one involving research and scholarship. On the other hand, I do not like to see the more philosophical type of subject entirely abandoned. Could not we have both? Different types of men would be attracted, the man of ideas—the designer, in fact—to the one, the scholar to the other. I beg students not to look down on the essay prize. Men who can see fine shapes in their imagination should be able, and generally are able, to write in good literary form. I frankly do not believe in the great inarticulate artist. He is apt to be a humbug. The biggest men from Michel Angelo to Reynolds, from Reynolds to our best modern architects, have all had this double facility of expression. I believe very strongly that the one form of expression helps the other, but we must never make the mistake, as old as Vasari and even Vitruvius, of accepting the one in place of the other.

Sir ASTON WEBB said he rose to make a voluminous proposal; he wanted the audience to pass a vote of thanks to Mr. Leonard Stokes for his presidential address, and then to Professor Reilly for his address, and lastly to ask the President to accept on behalf of the Institute a portrait. They had listened to Mr. Stokes' address with a very great deal of pleasure, and they hoped that as much pleasure had been given to him in the writing of it. From the applause he gathered that one of the paragraphs which gave the students the most pleasure was that suggesting for next year a competition for the best address and a prize of twenty guineas—a prize far in excess of what any president has ever received for his efforts. It was almost a pity that Mr. Stokes had not asked a student to reply that night, for if a student had been given leave to frankly express his opinion on the President, the Council and the Fellows of the Institute, the result would have been much more interesting than anything he (Sir Aston Webb) was likely to say. Mr. Stokes next advised them to cultivate youth and to keep it green. This had been so well done by Mr. Stokes himself that he was certainly the best one to advise others; and if he had the Elixir of Youth or would tell how it was done they would be pleased to adopt his principles and to carry them out to the best of their ability. In case the advice should be apt to make youth too elated and the older members too despondent it was well to remind them of the great address which Mr. Ruskin gave to the Architectural Association, in which he declared that the highest nobleness was usually found among the aged, the infirm and the poor, and not in the strong arm of the leaders. That thought must afford great satisfaction to those who were not still young. Reference had rightly been made to the great advantage it was for the audience to have the designs around them when the criticism was being read, though it was allowable to regret that the committee room could not still be used as of old. He would venture to congratulate the honorary secretary (Mr. H. T. Hare) on the very admirable way in which he had exactly met the requirements of the Royal Institute. In the President's address there was a certain touch of seriousness and encouragement to the student. Architecture was a serious matter and not merely a joke, being something in which a man might worthily spend his life. Architects were fortunate in being engaged in an occupation worthy of the very highest efforts of a man, for they worked not only for the pleasure but also for the convenience and well-being of the world. They were proud of being connected with the profession, and a student should work so that in due course he will take an active share in it, doing everything in a way becoming to an English gentleman. The students were lucky in having so competent a critic as Professor Reilly to criticise their designs. He had done it without fear and without favour. Sometimes the authors might have felt he was severe, but they all must recognise it was done in a kindly and friendly spirit and by one who knew. It was to be hoped that those who had been criticised would not take it lying down, but would turn up next year with a still finer design, and perhaps win the prize. In conclusion he had on behalf of the subscribers very great pleasure in asking the President to accept for the Institute the portrait of their old President, Mr. Ernest George, A.R.A. Mr. George was so well-known to them and had so lately occupied the chair that it was unnecessary to refer to him at any length. They knew him as Ernest by name, earnest by nature, and still

more earnest in his work. They all knew him, and all loved him as well. Mr. Ernest George was an artist all round, and one who had always looked on his work from that point of view—a point of view from which an architect should look on his work. The portrait was a very excellent and faithful likeness, the pose of the hands being to the life. The Institute was very fortunate in having had Sir Hubert Herkomer to paint that portrait, and it was one that would grace the walls as fully as the other presidential portraits had done. The Institute was indebted to the painters who had in the past come to do those portraits in such a liberal way, and he hoped their best thanks would be conveyed to Sir Hubert Herkomer and their high appreciation of having such a work on their walls.

The portrait was then unveiled.

Mr. SELWYN IMAGE, Slade Professor of Fine Arts, Oxford, in seconding the vote of thanks, confessed that the University of Oxford did not show all the recognition it might to the Fine Arts, and most especially to the Queen of the Arts—the art of architecture. Although his knowledge of architecture technically was really nil, he did claim to have (as much as any layman could be said to have) the sense of what was beautiful in architecture, and no one could have a greater idea of its value. So far as his poor efforts would allow, and spurred on by the words of the President, he would do his utmost to bring home to the University the enormous importance of recognising architecture as the very Queen of the Arts.

Mr. ERNEST GEORGE, A.R.A., who was greeted with great enthusiasm, said it was very gratifying to a president, who for two years had done his poor best, to meet with so flattering a reception. It was a great honour to have his portrait included among the fine collection of those who had done good work for the Institute.

Mr. Leonard Stokes and Professor Reilly having acknowledged the vote of thanks, the meeting terminated with the presentation of prizes and certificates to the successful students by Mr. Leonard Stokes the president.

GLOUCESTERSHIRE ARCHITECTURAL ASSOCIATION.

THE fourth annual general meeting of the Gloucestershire Architectural Association was held on Thursday, January 26, at the Northgate Mansions, Gloucester, Mr. H. W. Chatters in the chair, others present being Messrs. Wood, Trew, Dancey, Overbury, Malvern, Jones, Crisp, Iredale, Paterson and Davis. Mr. Walter B. Wood, of Gloucester, was elected President for the coming year, and Messrs. H. A. Dancey and T. Overbury Vice-Presidents; Messrs. W. F. Jones, S. H. Healing and J. Fletcher Trew were elected Members of Council; Mr. H. W. Chatters was appointed hon. corresponding secretary for Cheltenham, Mr. G. P. Milnes for Stroud, and Mr. Harold S. Davis hon. secretary and treasurer. An interesting programme was arranged for 1911. Hearty votes of thanks were passed to the retiring president, vice-presidents and officers for their services to the Association.

THE ART OF THE WOODWORKER.*

By Mr. HENRY TANNER, F.R.I.B.A. (*Official Report*).

IN choosing the title of my paper I selected it as above, and used the term art as I wished to indicate that I was approaching my subject from the point of view of design and not of construction, as I feel that my audience are better informed on this matter than I am; but I must further amplify this title by saying that I intend to treat it architecturally, touching on the various different phases in architectural English history, and showing how one branch, *i.e.*, woodwork, developed along the same lines as the art of which it was a component part.

I propose to deal with my subject by sketching as concisely as possible the progression in design especially as regards woodwork in England, both internally and externally, and touching on the various periods, their causes and effects.

Wood was, of course, primarily used constructively, and the early forms of design were evolved naturally from a constructional basis, and the craft of the woodworker or carpenter was one of the most important of the various trades, each its own designer and artificer, which in the early times composed the architecture of the country, that is, during the periods anterior to the time of Inigo Jones, when the architect became recognised.

In the early times wood was used as the main building material in the form of half-timber work, with plaster and wattle filling, buildings erected in this way being especially prevalent in the well-wooded districts such as in Kent, Hereford, Cheshire and

Essex, the means of traction being so limited that the building materials nearest to hand had to be utilised, while where stone and later on bricks were to be got wood was only used sparsely even in decoration; but later when brick and stone were generally available and wood scarcer, the latter material fell into disuse except for internal construction and decoration pure and simple, for panelling, fireplaces, screens and similar features.

In tracing the history of architectural design in this country the first period of which we have any considerable knowledge is the Norman in the latter part of the eleventh century, though in all probability the first principles of the style had been introduced before the Conquest, and the ground prepared, which accounts for the ease with which the Anglo-Norman architecture sprang into such a flourishing state in so short a time. The remains in this style are unfortunately for our present purpose nearly all in stone, though there are I believe a few wooden roofs in existence, and I show here a Norman screen from Compton Church, Surrey, which is the only specimen of woodwork of the period which I know of.

The Norman work, being really only the last phase of a dying style, did not last long on these shores; the debased Romanesque gave way to a very real and live product of our own country, not however without a struggle, during which the Norman and Early English work appeared blended together in the same buildings.

The examples of woodwork of the Early English period are nearly all simple in treatment, and are found in ecclesiastical work in roofs, doors, bench ends, &c. It is in fact only this type of woodwork that remains to us and with which our knowledge of the style is so intimately connected. The domestic life of the middle ages was very rude, and decoration of woodwork except for ecclesiastical purposes and rough furniture seems never to have been considered, the disturbed state of the country during the twelfth century placing the consideration of defence before comfort or art of any sort.

The golden age of mediæval art was the time of the first three Edwards, *i.e.* during the fourteenth century, and it is clear that ornament and decoration were attracting attention in all their branches. At Penshurst there is an elaborately carved hall screen in the Decorated manner and a fine wooden roof to the main hall. The screen from Rye Church is apparently early, but the carving seems to be of different dates and later. The porch at Boxford Church is an extremely unusual and interesting piece of woodwork with wooden tracery throughout, and I might mention other examples of Decorated work at Sudbury, Christchurch and Winchester.

One of the most wonderful uses of wood in the Gothic times was in the fashioning of the church roofs, one of the earliest forms being as at Stuston in Suffolk, with every rafter cross braced and the foot framed on to the wall plate with cross pieces meeting the rafter on the outside of the thick wall, simple and without carving; then came the tie-beam type, and the next development the marvellous hammer-beam roofs which are to be met with in such numbers in Norfolk and Suffolk. There are two fine examples at Swaffham and March rather similar in character, and a later one with pendants in lieu of the angel so much used before as a finish to the hammer-beam is to be seen at Eltham Palace.

The churches were now decorated with a profusion of carving, screens, font covers and bench ends; wood being perhaps the medium most largely used by the carver to show his ability in design and craftsmanship, such intricate carving as at Gidleigh and Lavenham testifying eloquently to the skill of the artificer in his work.

We have now with these last examples arrived at the third and culminating stage of Gothic architecture known as the Perpendicular, owing to its chief characteristic being the prevalence of perpendicular lines crossed at right angles by others little less pronounced, as at Walsoken Church, Norfolk. The detail, however, in the end became complicated, profuse and minute, showing clearly that decadence in taste which is the sure sign of the passing of a style when mere ornament applied in abundance is considered an advance on good design although less elaborate.

In the reign of Henry VIII. early in the sixteenth century the influence of the Renaissance was first felt in England with the introduction of Italian workmen into the country. Their work consisted chiefly of the designing and carving of detail and ornament superimposed on the Gothic foundation, and there are some very good examples of their work still extant, as in the roof to the great hall at Hampton Court Palace which had been started by Cardinal Wolsey; in the choir stalls at King's College Chapel, Cambridge, that crowning triumph of the Gothic period; at Romsey Abbey and at Herne Church, in all of which the Classic character of the detail is most pronounced.

* A lecture delivered at Carpenter's Hall, February 1.

Though the introduction of Classic detail was so important and so far reaching in its effect, owing to the prejudice against the foreign workmen and the wide difference in this style from that in which the English builders were accustomed to work, the new manner as imported straight from Italy never took root, but the short reference made to it above is necessary as an historical link.

It was the next development of architectural ornament which left its mark on so much of the sixteenth-century work in the style known as Elizabethan. This work was the outcome of the German influence in this country, introduced more by literature in the form of pattern books than by the actual workmen themselves, though the prejudice against foreigners was not so strong towards the end of the century and intercourse between these two countries was extensive.

The Classic work as seen through German glasses was florid, overloaded and bizarre, but it apparently appealed to the English worker of the day, who adopted the style of work but reduced it to a more reasonable standard, and though ungrammatical and quite unable to bear analysis from a Classic point of view the adaptation of the German manner was the inspiration for some of the most picturesque woodwork which has been produced in this country.

Typical examples of this work are the screens from the Charterhouse in the hall and ante-chapel, built in 1571 by Thomas Howard, Duke of Norfolk. The chapel screen especially displays the source of its inspiration in the debased sloping pilasters and the perspective ornamentation of the panels. The one from the hall has half pilaster, half caryatid embellishments to the upper storey or attic which are well known features of the style, and of which we shall hear more in reviewing the Elizabethan work later.

It would now, I think, be best to consider the various stages in the development of design in panelling from the Gothic times onward with the allied decoration as well, as it formed one of the most important features from 1500 to 1800 in which wood and wood-carving were employed.

The panelling of Gothic times, or seelyng as it was then termed, was previous to the year 1500 composed of far heavier scantlings and larger panels than the later work previous to the time of Jones and Wren, being generally constructed of uprights three or four inches square as far apart as twenty-four inches, and with cross pieces even further separated, and the panels of one thick board and the mouldings if any scratched on the rails and styles, and dying away before meeting the cross pieces. The upper panels were frequently treated with carving and painting, the lower ones being left plain, as in the screen at Haddon in the hall, and at Rye Church.

The most prevalent type of decoration over the surface of the panel was the linen-fold pattern, which was treated in a great variety of ways. The chief differences were in the arrangement of the folds and the shaping of their ends, and there are some very good examples at The Vyne, Basingstoke, and Bramhall Hall, Cheshire. As time progressed the panels became smaller and the framing less bulky, and in Henry VIII.'s time the panelling was much ornamented with carving such as heads and heraldic figures and emblems, as at Haddon and Compton Winyates, which also shows the linen-fold decoration; the mouldings also became larger, those on the verticals being worked in continuous lengths and fitted between the horizontals and stopping against plain faces left for this purpose, a troublesome and laborious method but an advance on the earlier one.

The next system was to carry the moulding round the whole panel, working the mitres on the rail, involving tremendous labour; and after that we come to the time when the mouldings were run separately, cut to a mitre and planted on the styles and rails, as in the dining-room from Haddon, thus allowing the framing to be run in convenient lengths and saving great labour in stops and mitres, though a better way still was afterwards employed, that was to work the framing all in moulded lengths and then notch out the rails to take the uprights, as in the work at St. John's, Oxford.

The Elizabethan panels and framing alike were often covered with carving, but it was flat and without modelling as at Croscombe, which also shows a very favourite treatment of the period, the semicircular arch and impost, all richly carved.

As the panel became smaller, ornamentation decreased and decorative effect was obtained by the variety in shape and the grouping of the panels and by the introduction of pilasters and entablatures as at Haddon long gallery and at Broughton, though carving was still used but not in the same profusion as formerly, the gallery at Haddon being exceptionally rich.

In Jacobean work the panelling was in itself simple, but the entablature was generally enriched with plaques, panels and the pendants so typical of the period, but the ornamentation was centred round the doors, fireplaces, and such like features.

The interior features of the periods we have had under review were of immense variety, and it is not by any means easy to tell their dates by the ornament, as this varied so much in different localities, and throwbacks often occur as at Broughton; also the output of domestic work during Elizabeth's reign was prodigious, wood being the building material most favoured, as it was the most plentiful, though the possibility of a shortage was foreseen even then.

No review of this subject would be complete without mentioning some of the elaborate hall screens for which the English homes have always been so famous, from the simple Gothic example at Haddon to the elaborate specimen at Middle Temple Hall (1570).

In the screen at Wadham College, Oxford, we have one of the most typical examples of a hall screen of its time, *i.e.* about 1610. The screen was a recognised feature of the hall, separating it from the entrance and the kitchen; it was generally the medium for elaborate woodwork and carving. At Wadham the elements of Classic knowledge are quite apparent, but the Renaissance proper was yet far beyond the grasp of the average builder and too severe for him to handle. It was only through the Dutch and Germans that the style got a foothold here, though I am glad to say the florid examples our forefathers based their methods on were considerably purified and their wild vagaries modified before being adapted.

The use of the orders is fairly correct and the mouldings of the entablature good in proportion, but when we look at the curious carved finials along the gallery front with practically no connection with it, we realise at once the source of the foreign influence. The flat strap work carving which you see in these examples was characteristic of Elizabethan work and was generally coarse and ill designed though rich in general effect. Hatfield and Sydenham are both good examples of the grand staircase of the end of the sixteenth century and beginning of the next. The former shows well the most favoured features of the designers of the day—the huge carved newels and finials with the amorini and heraldic terminals, the flat pilaster-like balusters and heavy handrail and string constitute a staircase well worthy of the stately mansion of which it is such an important feature.

At Compton Winyates the fireplace and panelling show the later woodwork of the style; the sloping pilasters, pulvinated shelves with their applied ornament and the lozenge-shape panels, all of which are well known features by which the date is easily recognised. Another very interesting late example from Broughton Castle is an internal porch, a feature which we find in no other period, arranged to allow access between other rooms. This particular one was not built till after the Restoration, 1670, and is a distinct reversion to the earlier style, but with the same typical features, with far less vigour of handling.

The next phase in English design, the Jacobean, is one of greater refinement and better proportion; the ornament and carving is not so lavish as in the earlier work when every available surface was wrought.

The relation of the various parts to a coherent scheme for the whole room is more noticeable, though the work still possesses that quaint and ungrammatical charm of manner which always appeals to us.

The Strangers' Hall at Norwich has a very interesting and unusual staircase in the bay window built in 1677. It is very picturesque both from position and design, with the carved pendants between the balusters and the heavy newels, and Brancepeth Church has a pulpit of about this period, a particularly elaborate example.

A good Jacobean fireplace is the well-known one at St. John's, Oxford, about 1631, which is quietly treated, and the one from the Reindeer in Banbury, which is of a somewhat later date, has some very good panelling and well carved cartouches, though there is one unsatisfactory feature that we cannot help noticing in both these examples, *i.e.* the centre division and pilaster.

We must now retrace our steps to the end of the Gothic period to give some time to the consideration of a separate chapter in the history of English woodwork, which is the external half-timber houses which were built in such large numbers in certain districts and called by many different names in the various localities, such as post and plaster, magpie, black and white, and half-timber, and we may safely say of those now remaining that they form some of the most picturesque architectural monuments which we have. An early example of half-timber work is that at Stokesay Castle, and I must plead guilty to mentioning it more from the pictorial point of view and general charm of composition than from possessing any peculiar interest as woodwork.

Ford's Hospital at Coventry is an example of the high standard of excellence to which the half-timber work of Gothic times was brought, with its delicate buttresses and pinnacles

carved on the face of every upright, the decorative tracery to the windows and the elaborately carved bargeboards. This building dates from 1529 and was built by William Ford, after whom the building is named; it is quite Gothic, and so is also the well known Guildhall at Lavenham, built about 1550. The lateness of the period of this house is shown by the window heads; the elaborately carved corner posts are well worthy of note also the nicely proportioned frieze of windows to the ground floor, and the whole building is a good example of the best Norfolk and Suffolk work.

The half-timber work of Cheshire and the neighbouring district was much more elaborate than in the southern counties, Presbury Old Hall being a good example of the general type of design, while Moreton Old Hall is, I suppose, one of the best known and most charming buildings of its kind that we possess from the point of view both of environment and design. The detail here is still Gothic, though the imported influences were even here beginning to make themselves apparent in such details as the pendants and brackets. Some if not all of the buildings were designed and executed by Richard Dale, a carpenter, who was clearly still under the influence of the English tradition, though the foreign influence was beginning to have its effect.

Another building of a very similar type is Handforth Hall, and as a specimen of the work of one of the best known English master builders of the West country there is the porch to the school house at Weobley, the work of Robert Abel, who was responsible for a large amount of timber building in this district, and in the rudimentary Doric column may be seen the signs of the approaching change.

The picturesque Kentish farmhouse at Wick, near Headcorn, and the Guest House at Lingfield possess the chief characteristics of the half-timber work of the home counties; it was never elaborate as in the West; the coved soffits, cusping and curved braces worked into patterns are not to be seen here, but simply the vertical and horizontal timbers and the curved brackets to the eaves which are such familiar details, and I cannot leave this branch of our subject without giving one example of weather-boarding, High Haldon, which was so much used in our southern counties at one time.

The half-timber work in England practically ceased in the seventeenth century, giving way to structures built of more permanent materials such as brick or stone; and owing to the scarcity of timber which was officially noticed in the sixteenth century, when (1605) a proclamation was published in London notifying that all new houses in the city were to be fronted with brick or stone.

After the Jacobean era a great change came over English architecture, brought about by the genius of one man, Inigo Jones, to whom we owe the introduction of the Renaissance proper, which altered the whole trend of our art; and he marks also another important epoch, which is the severance of the architect from the artificer.

The type of woodwork and carving began to change from this date, the Classic treatment gradually becoming the accepted style, and it is wonderful to think of the possibility of such an entire change of type in one step, as for instance to the staircase at Forde Abbey, with its elaborately carved balustrade panels, from the Elizabethan work at Hatfield. The character of panelling generally changed from this time; the panels became very much larger and the mouldings more elaborate, and what was merely a wooden wall covering in the earlier days became one of the most important features in the general scheme of decoration, as in the example from the garden hall at Raynham, which was built early in the seventeenth century by Inigo Jones. Another good example of Jones's woodwork is the staircase at Coleshill, one of the first complete Classic houses built in England, and the door to the main salon shows the correct type of work employed there.

Yet another example of his work is the doorway from the double cube room at Wilton. This magnificent room is looked upon as one of the best proportioned in existence, and is I think the first room in England to have been laid out as an entire scheme on such an elaborate scale.

One very important factor in woodwork which assisted so much to change its character about this time was the employment of new kinds of timber. Oak had been the almost universal material, varied occasionally by the use of chestnut, up to the seventeenth century—I mean, of course, in structural and decorative work. Rarer woods were doubtless used in furniture and smaller fittings, but after that time walnut and then mahogany came into favour, and softer woods with less pronounced grain were utilised for the carved work. It is obvious what an effect such a change in material must have on the methods and results of the wood-carver's work. The flat strap work and the carved ornament in low relief of Elizabeth's time gave way by degrees to the charming Classic designs and technical "tours de force"

of Grinling Gibbons and Cibber, whose treatment of floral swags and pendants was wonderful in its truth to nature and technical skill. But before proceeding to discuss the work of Wren's time we must not forget the connecting link between him and Inigo Jones, namely, John Webb, who as Jones's pupil worked with him on many of his buildings, and carried out others of his own in very similar style. Thorpe Hall, Peterborough, is his best work, and possesses a very fine wooden staircase with elaborate pierced panels in the balustrade and an effective treatment of the newel that is well worthy of note.

It seems extraordinary to us that at the same time that Jones and Webb were carrying out such typical Renaissance work, woodwork of a Jacobean and even an Elizabethan type was still being actively executed; but it must be remembered that this Classic work directly inspired from Italy was very restricted, its influence being confined to one man and his pupils; but with the advent of Wren and his school the knowledge of Classic art was very widely disseminated, and the older types of work which had grown up in the country and been handed down traditionally from father to son among the English builders ceased to continue.

In the hands of this school the treatment of woodwork was entirely changed, and as I pointed out before at Raynham, a general composition was required in lieu of isolated features connected by a certain amount of wooden wall covering without much incident.

During Wren's time we noticed the beginning of specialisation in the trades. Before Jones's time the architect, designer, builder and tradesman, to use the word in its original sense, were one and the same. He then lifted the architect to a separate position, and in Wren's time not only were the various trades strongly defined, but the carver, for instance, began to apply himself to work in some special material, such as Gibbons to woodwork, and Cibber to stone, and for the time being the resulting work was of the best, but afterwards slowly deteriorated. A fine example of Wren's designs and Gibbons's carving is St. Lawrence Jewry, and in the vestry door I think you can see clearly the beautiful forms of the mouldings as well as the carvings with which Wren's name is everlastingly to be associated. Another example of his work from St. Stephen's, Walbrook, though not quite so exquisitely refined as the last example, is one of great charm of manner, and from one of his most successful churches.

We cannot leave this subject without some reference to the most magnificent product of this phase of our nation's architecture, I mean St. Paul's Cathedral; and I cannot close my list of illustrations better than by referring to the woodwork of the choir stalls, which needs no remarks of mine to commend it to your notice and admiration.

Like all great periods and styles in art the zenith is no sooner reached than, unless a new and vigorous type assumes the command, decadence sets in, and this was the case with our architecture here; and having now threaded our way through the somewhat tortuous paths of architectural development in England up to the highest pitch of excellence to which we have ever reached, in Classic work at any rate, I think we can well leave our subject without inflicting upon ourselves the hardship of following our art through the subsequent decadent periods, which I fear have lasted down to our own time; and I can only terminate my paper by expressing the hope that it is left in our hands to do work which may worthily succeed the high standard to which our forefathers in the eighteenth century attained, not only in woodwork but in every other branch of architecture.

EDINBURGH ARCHITECTURAL ASSOCIATION.

COPY of resolutions unanimously agreed to at a meeting of Council of the Edinburgh Architectural Association, held on Friday, February 3, and submitted to the Committee in charge of the Scottish Memorial to His Late Majesty King Edward.

1. That the Council of the Edinburgh Architectural Association is gratified to learn that it is practically decided "that the Scottish National Memorial to His Late Majesty King Edward should be associated with the Palace of Holyrood and in or near the Palace grounds with appropriate public accesses." This resolution leaves room for diversity of treatment.

2. That the Council strongly deprecates the proposal that has been publicly made to erect a massive tower on the site of the ancient monastic gateway, inasmuch as it would obliterate the view of the Palace from the Canongate and conversely the view of the Canongate from the Palace grounds.

3. The Council also considered that it would be extremely unwise to remove the artistic and historical group of houses at the Abbey Strand, as has been publicly suggested.

4. That a select number of Scottish architects be asked to study the subject and submit designs for the general treatment of the project.

FORTHCOMING EVENTS.

Saturday, February 18.

Royal Institution : Mr. T. G. Jackson, R.A., on "Architecture—The Byzantine and Romanesque Period." (Second lecture.)

THE STUDY OF GREEK ARCHITECTURE.

PROFESSOR LETHABY in his lengthy and admirable historical lecture at the Architectural Association on "An Introduction to the Study of Greek Buildings," repeatedly disparaged the study of Greek architecture in a manner that was, we think, unfortunate, considering the character of his audience, largely composed of the youngest class of architectural students. At the opening of his lecture he said "I am in no manner to be construed as recommending Greek to you as the right thing to study." In his peroration he commenced, "While I do not recommend anyone to study Greek architecture specially, I can urge those who study it at all to do so in a bold, independent way."

It is to be feared that such words, from such an authority on architectural education, may be taken by the many students who desire to shirk as a justification for altogether ignoring Greek architecture as an exposition of art, and for only devoting as much attention to its history as the fear of examiners may compel. Thus they may follow exactly the wrong course. It is the history of Greek architecture that may be regarded as an unprofitable study except as a part of general culture and as facilitating the comprehension of the influences that made Greek architecture at its culmination what it was. It is no more necessary for a twentieth-century English architect to be able to distinguish between the prehistoric building work of Mycenæ, Tiryns and Crete, than it is for him to know the differences between palæolithic and neolithic pottery or flint implements.

Professor LETHABY's lecture was for the most part pre-eminently historical and archaeological, and we should like to be able to feel that it was the particular line of study of Greek work which he has himself followed that he deprecated for his hearers. Such study is, however, very far removed from that of the buildings produced by the artists of the Periclean age. These constitute some of the most admirable examples of architecture at its highest and best that the world has ever seen, and it surely cannot be otherwise than salutary for a student to devote his earnest attention to probing, and if possible understanding, wherein lies the secret of their excellence. Thus he will learn great lessons in architectural design which he can afterwards apply to any phase of architectural language in which he chooses to express his thoughts and his ideas, whether that language be Classic, Gothic, Renaissance or even New Art. This is quite a different thing to "designing pseudo-dipteral peristyles and Doric triglyphs," which Professor LETHABY seemed to imply was what he meant by the study of Greek.

Thursday, February 23.

Royal Academy : Lectures on Architecture by Professor R. T. Blomfield, A.R.A. : (2) "French Architecture of the 16th Century."
 Carpenters' Company : Mr. Whitworth Wallis on "Pompeii, the City of the Dead."
 Leeds and Yorkshire Architectural Society : Mr. H. E. Henderson on "The Minor Domestic Architecture of Yorkshire."

We cannot conceive that it is necessary to design pseudo-dipteral peristyles and Doric triglyphs in order to understand and even to imbibe the Greek spirit, which the Professor suggested we might share by "perfecting stock-brick walls, chimneys and down-pipes," but which we fear will ever remain an unknown quality to those who ignore the study of Greek architecture at its best.

It is the fashion at the present day amongst a certain section of pedagogues to decry the study of Greek by schoolboys, but there is scarcely any subject in the whole of their curricula more effective than the study of Greek language and literature in correcting that vagueness of thought and looseness, nay sloppiness, of expression which are so characteristic of twentieth-century writing and speaking.

So in the education of an architect the great and inestimable qualities of proportion and refinement can be instilled, we are perfectly convinced, in no more ready way than by the study of the best Greek buildings.

Even Professor LETHABY was constrained to admit that "There is no doubt that the Greek builders delighted in setting out their buildings and their several parts in dimensions which had relations one to another." And yet he spoke of the time devoted by many painstaking students to the elucidation of these proportions as wasted, and indulged in a perfectly unjustifiable sneer at their labours. There are still many of us who have known the late Mr. FRANCIS CRANMER PENROSE, and regard as an insult to his memory the insinuation that those who have measured Greek buildings for us have not hesitated to falsify their dimensions to fit their theories.

Where would Professor LETHABY's knowledge of the curvature of lines by the Periclean Greeks have been if it were not for the microscopical accuracy of measurements by PENROSE and others. And are Mr. PENROSE's investigations and conclusions of the systems of proportion employed in the Parthenon to be dismissed as mere moonshine imaginings by one who is forced to recognise the application of curvature to lines which he revealed to us?

It is clear to us that Professor LETHABY has not in the slightest degree grasped the meaning of proportion in architecture, when he asserts that the eye "takes no heed of the accuracy of the relation of eight to one or the same with 2 inches added or taken away." This may be true of the Professor's eye, just as there are amongst us ears that cannot distinguish between a true note and a false one on the violin, but it is not true of the perceptive eye of the artist.

Referring again to the curvature of lines, Professor LETHABY said that "Such adjustments are most natural

in a highly refined school of architecture." There could scarcely be a more complete proof than his own words of the unsoundness of his advice to young architectural students not to study Greek architecture. A highly refined school of architecture is to be ignored by them. We should have thought that such a school should receive their most earnest and careful study with the full intention of imbibing, if possible, a little of that Greek spirit which has given the world some of the greatest masterpieces of architecture. We trust that the members of the Architectural Association Schools will be sufficiently bold and independent to turn a deaf ear to the Professor's unwholesome advice.

NOTES AND COMMENTS.

It is somewhat unfortunate, we think, that the Council of the Royal Institute have not felt themselves able to specify more precisely the manner in which the author of the design to which the Soane medallion was awarded had "failed to comply with the conditions of the competition." The failure was clearly not apparent on the drawings, because the prize was awarded, and consequently all sorts of rumours are afloat, some exaggerated and some baseless.

We cannot admire the way in which the Council evaded their own difficulty by deciding not to award the Soane medallion this year. The design "Civitas" being withdrawn, it was their duty to find the best design of the remainder submitted, and to carry out the promise made in the name of the Royal Institute that the Soane medallion "will be awarded for the best design." There can be no question that there were several designs submitted this year equal in quality if not superior to some that have won the medallion in past years, and it is extremely hard upon those students who have spent so much time and produced such excellent work that, through an unfortunate contretemps, they should have competed for a **virtually** non-existent prize. It may be said that as the original award gave equal recognition to two designs there was no best, but such an argument is opposed to all ideas of fair play. Because a number of brilliant young men all do good work therefore the prize shall not be awarded is an absolutely unthinkable proposition.

In the case of the Soane there was not the excuse that has been put forward with regard to the Grissell Prize, that none of the competitors were worthy to receive it, though even in this latter case we do not consider that the Council was justified in withholding the prize. When the promise has been made that a prize "will be awarded for the best design," that obligation ought to be discharged, even if no competitor comes up to the standard of past years.

It is unreasonable to expect that the standard of achievement will in various years be uniform, or even that it will reach any given level. It is impossible also for the judges to maintain any particular standard in their consideration of the designs submitted. The difference in character and difficulty of the subjects given, and the varying personality of those who decide the awards, render a continuously level standard unattainable.

We are very much disposed to believe that the withholding of a prize that the Royal Institute has asserted "will be given to the best design" is a legal breach of contract, and that every one of the competitors for the Grissell Prize would succeed in an action for damages for the value of his time and money spent on the preparation of his design. Certainly we are confident that the practice of withholding prizes which have been offered, although supported by precedent, is very unwise policy and very bad form.

The development of the London County Council Central School of Arts and Crafts certainly has not up to the present been commensurate with the capital

expenditure on building and equipment, and we are therefore not surprised that the Education Committee have recommended the Council to appoint a whole-time Principal at a salary of 1,000l. a year. If the School is to occupy its proper position it must have a head who will devote his whole energy to its work, and the right man will be difficult to find. He must have full sympathy with and appreciation of the work of every art and craft; must be an efficient organiser, a thorough educationist, a keen critic, and a good man of business. He must not be a visionary, a dreamer, or an expert in any one branch of art.

The Finance Committee of the Liverpool City Council has found a solution of the problem of the King Edward Memorial in a thoroughly English way—by compromise. What else could be expected with a number of eminent architects and Royal Academicians saying one thing and others equally eminent contradicting them? We doubt very much whether all those who have lent their names to the controversy have even seen the models or possibly even St. George's Hall, but for the Philistine there can be little reliance in the artistic judgment of experts when men of high reputation split into opposite camps. The Committee has decided to recommend the adoption of Mr. NORMAN SHAW's scheme for the steps, but with spaces at each end of the podium for statues, that of King EDWARD VII being placed at the end nearest to Lime Street. We have not seen the models although we know St. George's Hall and we therefore express no opinion.

In *The Connoisseur* for this month we have a particularly good number. The second part of Mrs. WILLOUGHBY HODGSON's description of Mr. W. H. LEVER's collection of Chinese porcelain deals with blue and white ware, of which many beautiful illustrations are given. Of architectural interest is an account of the charming old house known as St. Peter's Hospital, Bristol, with its wealth of seventeenth-century carved woodwork, both internally and externally. Eighteenth-century portraiture by RAEBURN and others bulks largely in the illustrations.

WOOD-CARVING.*

By LAURENCE A. TURNER.

(Official Report.)

WOOD-CARVING is generally affirmed to be the most popular of all the artistic crafts. That it should be so is natural, inasmuch as it can be used to adorn so many things that are in every-day use in our homes. It is a clean occupation, and can be made an amusing pastime or a strenuous employment, just as the whim of the person may fancy. How many people have taken it up as a whim, but soon laid it aside with a sigh! They have very soon found it is not as easy as it appears. I think it is about the worst of all the crafts for an amateur to choose. The number of technical difficulties to be mastered is much greater than in other kindred crafts. The difficulty of collecting a set of tools and getting them into condition fit for use, and keeping them in good order, is a matter requiring great experience and patience. The beginner at the very outset is confronted with the heavy handicap of having to work with tools that are in a condition that even an experienced carver could not work with, and yet he has to use them, without skill and without knowledge. Half the battle of wood-carving is learning to sharpen tools and get them in good order—that is to say that their shapes, sizes, temper, thickness and curve of the cutting edge require to be adapted to the use they are to be put to.

How to produce a good school of young wood-carvers is at the present moment occupying the attention of more than one of the influential societies around us. To my mind there is only one way, and that is the old one, of apprenticeship. Wood-carving is one of those industries in which apprenticeship has disappeared. I don't know a single carver who takes his place in the ordinary round of London workshops who has not served his apprenticeship.

* Part of a lecture delivered at Carpenters' Hall on February Third of the Series on "The Arts Connected with Building."

This Honourable Society, the Carpenters' Company, are doing the right thing to benefit the wood-carver. It was my privilege to go the other night and see the class held in their schools at Great Titchfield Street for the advancement of wood-carving. It is the best of its kind I have seen. We owe them a debt of gratitude for the work which they are doing there so well and thoroughly. No trouble, care, or expense is spared by them to do what they can to help the wood-carver to improve his position; and not the wood-carver only, but most of the other craftsmen connected with building.

Until the carver has been through the discipline of a workshop, where he will be taught the traditions connected with carving,

limited kit. What the apprentice most needs, and what he seldom gets during the years of his apprenticeship, is the opportunity to block in and rough out the carving from the beginning: he is generally employed in finishing what the older carver has begun. In the evening classes such as I have just referred to he should be given a block of wood and taught to see the planes that the work should be boasted to, to see the contour of the masses, that he may quickly rough out the work and remove the wood in a workmanlike way. He should be taught to draw, so that he may with as little labour as possible be able to convey his ideas on paper. Highly finished chalk drawings from the antique are not of the kind he wants to learn.

BENCH ENDS, EAST BUDLEIGH, SOUTH DEVON.

He will never become a master of the craft. He may no doubt be able to produce some excellent work, possibly of great originality, but he will not have that grasp of carving generally, that ready perception and comprehensive imagination that is required of the carver who has to work for many masters. It may be said that it is better that he should not be so constituted; perhaps so, but as things are now it is absolutely necessary that he should receive this wide training if he means to gain his livelihood by wood-carving.

To debar the beginner from learning all he can from those great masters who have come before us is as narrowing as it could be to give an apprentice half-a-dozen tools and tell him that he must do his work for the remainder of his life with that

The reason why carving is roughed in by one man and finished by another, which is the usual custom, is that apart from the fact that the first stage of the work requires greater skill and knowledge, the tools used for finishing require to be kept in a different condition from those employed for roughing in. They have to be sharper, and consequently have a thinner edge. If those used for roughing out were sharpened like the finisher's tools they would be constantly gapped from the strain that is put on the edge by the heavy use of the mallet.

The most important thing to remember in wood-carving is to make every cut tell. The great charm of a well carved piece of work is the spontaneous effect it should possess. The work should appear as though each cut was the result of a

single thrust, not laboured or niggled, but direct, decisive and firm. This quality should be particularly marked in soft wood such as pine. Carving that is laboured, and over-finished so that the mark of the tool is not detected, is very dull; one ought to be able to see how the work is carved, but if you cannot most of its interest is lost.

Carving is a thing to be done rather than talked about, to be seen rather than the lecturer to be heard.

The main difference between the principal tools is first of all that some are shouldered to prevent the steel from being driven into the handle, and are used for heavy work. The chief difference between carvers' tools and other wood workers' tools is that the carvers' tools are sharpened equally on both sides. Also that in shape they are bent to allow the tool to make deeper hollows than could be done if they were straight. Most of them are made from a square piece of steel which is widened out suddenly to form the shape for the cutting edge: these are called spades. It is very important in the bent gouges that the curve should be exactly right, so that leverage comes on the right place. The curve from the edge to the heel should be a continuous one. The fluter is an important tool inasmuch as a great deal of work is outlined with it. Instead of setting in the outline of the design by driving the tool into the wood at right angles to the ground, this tool cuts a groove round it, thereby avoiding the unseemly cuts in the ground that may be found when the work is finished. Even if there are not cuts, the wood will be bruised by the other method. The sharpening of these bent tools is a slow and laborious process, as there is very little room for movement of the oil-stone slip on the inside of a bent gouge. The number of tools a carver has to form a kit may be any quantity from about six or eight dozen to a gross or more.

Most of the painted medieval work was given a coat of gesso before being coloured, to soften the cuts. I think it is justifiable to use glass paper judiciously on carving that is to be painted. This is the exception to the rule that should always be remembered in wood-carving, that every cut of the tool should tell and be a help in producing an effect in drawing as well as contour.

In the strap work ornament there is great variety in the width of the bands. Modern imitation rarely possesses this feature.

For this type of Jacobean work it was outline rather than modelling that was aimed at, and very vigorous that outline was.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Royal Institute was held on Monday last at Conduit Street, Mr. Leonard Stokes, president, in the chair.

The decease of Mr. Alexander Cullen (Fellow) was announced.

Mr. E. A. RICKARDS was then called upon to read his paper on

The Artistic Development of London.

After all that has been said during the last year under the inspiration of the movement which culminated in the Town Planning Conference, it is difficult, said Mr. Rickards, to find any original abstract thoughts on the subject. There-

EMBLEMS OF ST. JOHN EVANGELIST. FRENCH OAK CARVING, LATE 15TH CENTURY.

There is a very simple form of decoration sometimes used, the ground being sunk and the outline cut in with a parting tool or V tool, but it is a very effective method and tells well at a distance.

This sort of carving would be much more interesting to do than what is called chip carving. I recommend it to the Kindergarten teachers.

Some examples of the same method of work have been painted all over with a preparation of black wax, the face of the wood afterwards being cleaned off.

In showing a series of font-covers Mr. Turner said that in all this type of work the carving takes a secondary place; the architectural design is the important thing. But the carving although secondary requires to be treated in a masterly way. It must not be laboured; it must be kept broad and simple. Crockets require to be little more than shaped outlines, but the sum and total of all these small shapes is a most important factor to the success or failure of the whole. Now this is one of those things that cannot be talked about; it is only to be done and learnt by a close study of good examples.

Carving for such a position as in a roof must be kept exceedingly simple; it is little more than outline that is required.

fore he proposed to confine himself to a few disjointed observations which might come under the heading of artistic development as applied to the externals in the central and best known portion of the city.

If London is to affect the large manner of the Continental and American city, she has little as a basis to work upon; certainly no centre of interest such as the buildings and gardens of the Louvre and the avenue leading from them. When one thinks of the development of a city one thinks naturally of some such central motive—the occasion offered in the historic case of Wren and his scheme in connection with St. Paul's. Such chances have consistently been lost sight of or ignored from then onward, and in our own time the opportunity presented at South Kensington with the Albert Hall as a beginning stands out as an example.

With all its deficiencies this neighbourhood occurs in the mind as one of the spots on the map of London. Had any real symphonic treatment of the neighbourhood taken place around the Albert Hall, in which the theme given out by this building could have had its due development, we should have had some such central motive for this portion of the city on a scale that would have brought it into touch with other centres that now seem remote. Compare, for example, the

SCREENWORK, DUNSTER, SOMERSET.

apparently close relationship of portions of Paris with what seems undue separation between others in London.

There is abundant evidence that we have never cared for development in the literal sense of the word. The jealous way in which the very large amount of open space in London has been guarded is a large part of the proof. This is a superstition which will have to be mastered if we are ever to create any considerable spheres of influence and character in our new city, any effect of space through which a motive may be repeated and developed in all its possibilities of form and suggested harmonies. We hear enough of how iniquitous it is that private ownership should stand in the way of the small street improvement, but how much more so it is when a small corner of some Crown lands or public space stands in the way of the general good?

Then, again, we lay down restrictions in the material to be used in certain new streets. No other material than stone to be used for the elevation of business premises for example, while some of our largest public buildings are being erected with such a material as red brick largely introduced and cutting up the façades. This is surely reversing what might be the real order of things. In new avenues that have been laid out in which it has been possible to allow of a certain direction if not an absolute vista, gable fronts are permitted which break all continuity of design and any feeling of coherence which decided horizontality in the character of the buildings would have ensured.

As an example from which much might be developed and acted upon in the treatment of many of our avenues, take Pall Mall, perhaps the most beautiful street in London by reason not of its uniformity, but of its harmony of design and the subordinate interest of its individual buildings. Double the scale of operations and you have Oxford Street with its emporiums in place of clubs, capable of just as solid and artistic an expression of their purpose. There is some evidence already of this in the strongly marked horizontal lines of the several new blocks lately erected and the happy abstention from the angle entrance. The motive of the successions of lamps and braziers which line the areas to the clubs and make a beautiful vista, might be introduced in the avenues of mammoth stores, though the handsome standards of regular height, would in character correspond with the building opposite which they are placed. Lombard Street, with its signs and again strongly marked horizontal features, though of very different proportions, is another of many examples of motives that might be developed. In the case of shop-fronts and subordinate features, the interest is localised and the greater the variety in contained spaces the more artistic and interesting a street may become. The exotic element in a cosmopolitan centre such as the Rue de la Paix in Paris is an example of this, and the shop-fronts of Regent Street had this very fine precedent when their individuality

was first threatened. In London, with its narrow streets, it must be recognised that the commercial plane or the bazaar is on the street level and not a few storeys above. The eighteenth century in London recognised this and we in our own age of ugly advertisement have cut across this tradition and invented the display of the façade above.

Some simplification of the units of street design is essential if the formal ideas lately so much the mode are to be embodied and materialised amongst us.

Apart from the practical advantages of direct communication and other attributes of light and air, &c., it is difficult to see the artistic gain in such London developments as Kingsway and its approaches, if the so-called improvement is carried no further than it exists as it were on paper and is confined to one dimension.

The scale of London which has taken so many centuries to evolve will always be with us, and if we can possibly give an effect of order in the many improvements of our time we shall be developing in a much freer manner than by these Continental schemes in miniature. A feeling of order is the most we can hope to attain to, and this combined with interesting detail would eventually result in a beauty which would be London's own.

MR. PAUL WATERHOUSE then read a paper on—

The Artistic Development of London.—The Means to the End.

By "artistic development" he referred to architectural development. If London has to be developed there are duties which can only be done by architects. Almost everyone would be ready to prepare the necessary plans for the improvement and development of the Metropolis. Therefore he did not intend to advance any æsthetic project, but merely to inquire by what means any such projects as may be forthcoming are ever to be brought to fruition in fact.

Cities beautiful owe their beauty to their streets and their houses. The streets may be beautiful by accident and irregularity or by deliberate street design. The houses of these streets may be beautiful individually or collectively. Our London contains beauty of all these four kinds: two classes of streets and two of houses. But it is clear that some artistic sense should ever be watchfully controlling these four elements of beauty. Though the present age in England is exceptionally strong in the numbers and qualities of architects, yet enterprises of vast importance are sometimes undertaken in London without any architectural advice whatever; and even if first-rate architects are engaged, there is a conspicuous lack of general architectural control. Construction as ruled by the Building Acts is admirably censored and controlled by an excellent system of district surveyors. Sanitation is also rigorously and vigorously regulated by the surveyors of the various borough councils. But the art of

OLD CHEST, EAST DEREHAM, NORFOLK.

London building passes almost free of public control and stimulus. The problem is not whether more artistic control is required—for that is a certainty—not whether architectural talent is available, for that also is a certainty, nor what would Mr. A. or Mr. B. or Sir X. Y. Z., the leaders of our craft, make of the London problem if they were in charge of it, for that is a mere hypothesis. No; the problem is this: How are Messrs. A., B., and Sir X. Y. Z. to be brought within striking range of the work which so obviously lies waiting for them? There can be no possible doubt but that what is needed is the employment by London for London of the very highest architectural advice in those problems of collective architecture which are greater, not less, than the task of designing individual buildings for individual sites.

But no one man could do all the work that needs to be done and no committee of men can effect work which can be styled work of art. How then are we to get individual artistic genius applied to the whole of this great acreage of buildings? Mr. Waterhouse said his suggestion was that it should be made compulsory on each of the boroughs whose territory comprises the heart of London to appoint a borough architect. The functions of that architect would in no wise overlap either those of the district or borough surveyors. Both of these classes of men have their hands full, and do their work uncommonly well. The borough architect would have as his primary and simplest work the passing or rejection on purely æsthetic grounds of the designs of intended new buildings. His critical censorship would extend to the admissibility of altering and preserving valuable old buildings. With him again would lie the duty of advising his borough, probably in consultation with a central authority, on the formation of new streets or new frontages; to decide whether in certain places individualistic architecture should give place to the grouping of houses in larger composition, and he would be looked to as the guardian of art in those public works which boroughs so often carry out without any architectural advice whatever.

In cases where, as in the formation of squares or the approach to a bridge, collective architecture seems desirable he would very probably be himself responsible for the elevations, though having full liberty to initiate a competition for such work or to advise the engagement of another architect. The borough architect, who must essentially be a man of accepted and conspicuous standing, should be paid a fixed and inclusive yearly income. He would not be debarred from general practice, but should be prohibited from private engagements in his district. The appointment should not be permanent—say, in the first place for three years only, and then renewable at the option of the borough, for other successive periods of a like span. Next Mr. Waterhouse dealt with the grave question of the method of appointment. Without doubt, he said, the nominations should come in the first instance from the Council of the Royal Institute. Special

conditions would no doubt apply to the nomination of the original appointments, but if once the scheme were in full working order the most natural procedure would be for each borough, when its vacancy occurs, to make application to the Council of the R.I.B.A. for the nomination of not less than two men from whom the borough would then make their own selection. The initial nominations would in like manner be made by the Royal Institute.

The Act of Parliament enforcing the scheme would no doubt make it obligatory upon certain boroughs—*e.g.*, the City of Westminster, the Royal Borough of Kensington, and the Boroughs of Holborn, St. Marylebone, St. Pancras, Paddington, Lambeth, and Southwark—to appoint architects forthwith; the remaining boroughs should be given the option of making appointments, but most probably in the course of a very few years or perhaps months a friendly rivalry in the matter of architectural prestige would lead to the rapid adoption of the system throughout the metropolis.

There would have to be some architectural monarch controlling this commonwealth of artists in the interest of co-ordinate action. His electors should be the whole body of already appointed borough architects; they should have liberty to select him either from their own number or from outside, but if from outside they should, as in the case of the boroughs, seek a nomination of two candidates from the Royal Institute. The chief architect would of necessity be the adviser of the London County Council, and would, therefore, hold his engagement from them. The Council would accordingly object to delegating their own powers of appointment to any outside body; but, at any rate, the Board of Borough Architects should be allowed some voice in the selection.

The duties of this architect-in-chief would be other and wider than those of the present architect to the London County Council, being severed from all functions of Building Act control and of the design of Council buildings. The proposed architect-in-chief would be *imprimis* the adviser of the London County Council upon the whole handling of their larger schemes. All new streets that run from one borough to another would be in his charge; all bridges and cross-river communications would come under his control, and generally he would be the appointed adviser on the artistic problem of London as a whole. His relationship to the borough architects would be intimate and probably cordial. He would be officially the chairman of their monthly meeting, informally he would be their constant advisory colleague. There would be in the case of architects or owners objecting to the censorship of a particular design by a borough architect a right of appeal to the monthly board, and this would virtually mean that all doubtful cases would come before the architect-in-chief. Subject to a period of probation at the outset and of retirement at the close, this appointment should be both permanent and exclusive.

TYROLESE DOOR OF CABINET. LATE 15TH OR EARLY 16TH CENTURY.

The objector may still have something to say against my architect-in-chief. "Why," he will ask, "put any single man into a position of such awful supremacy?" My answer is that the position of awful supremacy exists whether we appreciate the fact or not. It exists and it is wiser to fill it with a man than to leave it occupied by a vacuum. The problems which would be the province of this architect-in-chief, if ever he be appointed, have undoubtedly got to be solved somehow. They are now waiting for solution. They may, of course, be solved by the haphazard decision of unarchitectural citizens sitting in elected oligarchy over London's destiny, but is that the right course? And, if it is not, surely the only reasonable alternative is the voice of an individual, the only voice that can really control an artistic issue. And is it not right that such an arbiter should be selected by the most critically artistic electorate that we can devise? His autocracy would be sufficiently tempered by the Board of architectural colleagues.

Mr. LEONARD STOKES, in calling on Lord Beauchamp to open the discussion, remarked that they had that evening the lion and the lamb among their visitors, and he would ask them to propose and second the vote of thanks.

Lord BEAUCHAMP (First Commissioner of Works) said he accepted with pleasure the President's description of himself as the "lamb," and he would leave it to the "lion"—in the person of the Chairman of the London County Council—to second a very hearty vote of thanks to the readers of the two papers. He would like to say a few words in praise of London as it was to-day. All would admit that there are exceedingly ugly buildings to be found up and down London. But at the same time there are exceedingly beautiful buildings, both old and modern. We were far too ready to depreciate and decry the circumstances under which we lived. We were now in a period of almost golden age. During the last fifty years England has produced a number of masterpieces both of literature and of art, and we can produce extraordinarily fine work. There was hardly a single form of art in which we could not show some first-class person from among ourselves. Consequently he felt impatient with people who decry British art. However, he was almost in despair at the high prices given for works by bye-gone masters. Praise was bestowed on people for being patrons of art who did nothing more than commission art agents to spend large sums of money on the purchase of old masters. Often it was merely a form of advertisement. A more enlightened public opinion would make them realise that they would be doing more for art if they did something for the artists of to-day. One could very seldom go into London without seeing some beautiful sights. If only people would walk about with their eyes a little more open they would appreciate these things more. The difficulty in talking about such a subject was that

it soon became a matter of individual taste and opinion. You may differ from a man on any question of immense importance without mishap, whereas in discussing taste such a quarrel may result as to prevent your speaking to him for years. They would all agree with Mr. Waterhouse's three general propositions:—(1) That the preservation of London's past and the guidance of London's future are an artistic trust of the greatest importance, and that so important is that trust that those on whom it is imposed should in their own interests take reasonable professional advice as to its fulfilment. (2) That, as it is not merely an archaeological trust but an artistic one, the necessary guidance of the action of the trustees should be sought not from committees or societies but from individuals. Art is produced by individual artists, not by corporations, and (3) that the proper advisers are architects. He was glad, however, that in a later passage Mr. Waterhouse admitted that committees did some good, for they sometimes do stumble into doing the right thing. In matters of that kind architects were certainly the proper advisers. He had to confess that it was not so very long ago since he himself was to be found among the critics of the Office of Works; and he only hoped that he could still appreciate criticism when offered. As First Commissioner he would always have an open mind on any criticism.

Mr. WHITAKER THOMPSON, in seconding the vote of thanks, said that as chairman of the London County Council he was particularly interested by the reference in Mr. Waterhouse's paper to "the haphazard decision of unarchitectural citizens sitting in elected oligarchy over London's destinies." In his own case he never had been an architect and he never professed to know anything about it. He certainly knew what he liked in the streets; and if the Royal Institute would appoint him the chief architect of the L.C.C., he was prepared to make London what it ought to be—according to his own ideas—if the Council would let him do as he pleased. The members of the County Council had to look on matters from a point of view rather different to other people. They would like to insist on the best forms of architecture in the new streets, the widening of old streets, and the retention of all that was beautiful in the latter. They got help from some architects, but not from all; for some of the designs submitted failed to come up even to his unarchitectural ideals and were not consonant with the buildings on one side or the other. He did not want to see patchwork streets, but rather something a little more harmonious than is now being put forward as the latest in individual street architecture. With regard to the most original suggestion of having twenty-eight borough architects with a central architect as chairman, he could picture from his own experience what a high old time the latter would have when presiding over the accumulated

CARVED OAK PANEL. ENGLISH 15TH CENTURY WORK.

scholarship of all those others. The idea was, however, well worth consideration. Even though they might not attain to it all at once it would be a magnificent thing if the authorities could get competent advice in the different parts of London either from men receiving a reasonable honorarium or from those who would do it for the honour of the thing. In looking at buildings nothing appealed to him personally so much as simplicity. He thought that tradesmen should as far as possible be restricted to advertising themselves on one floor, leaving the others to something else.

Sir LAURENCE GOMME said he would venture to suggest that inasmuch as it was entirely wrong for those who were not architects to discuss purely architectural problems, so it was not quite fair for a layman to begin the work of constitution-building. The constitution suggested by Mr. Waterhouse left out the most important fact that London required an ideal of its own, and that it could not have twenty-eight ideals. It was just as important for Stepney and Shepherd's Bush to be in close touch with the architectural beauties of London as it was for them to have a beauty of their own. He would ask for a larger ideal than that put forward in the paper, which should be compared with the ideal of the Roman city of London. That city was built on the ideal of the city of Rome herself. At the present time they wanted to carry out the same ideal in all the great cities. The first duty of the architect of to-day was to supply the principles for artistic development; and he should not attempt to carry out those principles until they were settled. Street corners afforded a great opportunity in the architecture of the city of London. He suggested that the architects of London should first of all apply themselves to the architecture of street corners, leaving for a later time the filling-in between the corners. It was remarkable that their old and beautiful streets, like those of Chester and Salisbury, dated before the advent of the architect. For instance, Sir Peter Paul Pindar built up that beautiful house-front of his without calling in an architect. The explanation seemed to be that every citizen then had the ideal of beautifying the city in which he lived. London was a city of lost opportunities; but if architects would come forward with advice the position might be recovered. The English people were generally most illogical, only carrying out a project half-way. He believed and hoped that the papers would prove steps to some great improvement in London's future development.

Professor BERESFORD PITE strongly protested against the assertion that London was a city of lost opportunities. There were, he contended, few cities that can compare with what London possesses to-day, either in ancient or modern buildings. One would have to go a long way to excel such a group of mediæval sacred buildings as Westminster Abbey, St. Bartholomew's, Smithfield, Southwark Cathedral, and the Temple. Or think of Lambeth and Fulham Palaces, and the Tower of London! Thus in ecclesiastical or palatial or castle types of building London possessed the finest in the country. Where in Europe would one group Renaissance buildings like Greenwich Hospital, Somerset House, and St. Paul's? London was not a city of lost opportunities—it was a city of gained opportunities—and there was none other like it. Turner had said that St. Paul's made London. There was no need either to lament over lost ideals; for in the Palace of Westminster they possessed a building which would bear comparison with anything in the modern world. The profession are now face to face with a stiff-necked generation in the matter of art. They had, however, to be thankful for some great public improvements. In that connection they could not let the opportunity pass of expressing their satisfaction that Sir Aston Webb would be entrusted with the work of completing his scheme in the West End of London

where a great recognition had been witnessed of architectural principles. The chairman of the London County Council had referred to municipal architects strengthening local borough councils with voluntary architectural knowledge. They could only hope that the authorities would so conduct their business that architects will be able to afford to give advice.

Sir ASTON WEBB said that Mr. Waterhouse had made reference to proposals of his made some years ago when occupying the presidential chair, and with particular reference to the Commission of Taste as existing in America. Lord Plymouth, the then First Commissioner of Works, who was present at the meeting, had, at the request of the R.I.B.A. Council, brought the matter before the attention of the Government. And there the matter remained. He could only hope that something on the lines of Mr. Waterhouse's scheme would be carried out. As in official life the expert was never given an entirely free hand, it was probable that the chairman of the suggested borough architects would not have things entirely his own way. Possibly he would not be an architect at all, but a man of taste and refinement. It seemed to him that the papers read that evening were the kind that the Institute should have, and they were likely to influence public opinion. Public opinion appeared to be interested in architecture and in the importance of towns. The two papers showed that the Institute was doing its duty to the town in which they lived.

Mr. LEONARD STOKES, having briefly closed the discussion with a few remarks, put the vote of thanks, which was carried by acclamation. Mr. RICKARDS and Mr. WATERHOUSE then replied, and the meeting terminated.

ILLUSTRATIONS.

EXAMPLES OF WOOD-CARVING.

THE whole of our plates this week are illustrations of Mr. Laurence Turner's lecture on "Wood Carving" at Carpenters' Hall, on February 8. The two panels showing St. Mark and St. Luke are from the set of four at the Victoria and Albert Museum showing the four Evangelists. They are fifteenth-century Tyrolese work and are carved in lime, which is the best of woods to use for fine carving. The panels are essentially wood and delightfully conventional.

The chimney-piece in the Board-room of the New River Company shows craftsmanship of quite another kind. It may be objected that the lion and the unicorn are too well fed; but the rest of the carving is about the finest technically that Grinling Gibbons ever did, and as a piece of realism could not well be surpassed. Further proof of his virility is seen in the plate showing a bracket in the library of St. Paul's.

The mahogany frame carved with foliated scrolls and a mask is early thirteenth-century English work. It is a vigorous piece of design and workmanship. The thicknesses of the edges are here of the utmost importance. It should be observed how the surface becomes the thickness, and vice versa.

The two doors of carved oak with brass fittings are from a Dutch ecclesiastical screen of about 1700, and are remarkable for the broad, simple treatment of the fret work. It was probably carved with the intention of its being gilded or painted, which would account for the broad flat treatment.

With the exception of those from St. Paul's Cathedral and the Metropolitan Water Board's offices, the originals of the above examples are in the Victoria and Albert Museum.

THE ARCHITECTURAL ASSOCIATION.

AN ordinary general meeting of the Association was held at 18 Tufton Street, S.W., on the 6th inst., Mr. Arthur Keen, President, in the chair. The following were elected as members of the Association:—Messrs. P. Butt, Oakwood, near Chesham; L. A. Gundry-White, Norwich; Alberto Meza, Richmond; and R. W. Stoddart, Abbey Wood, Kent. The re-instatement of Mr. J. W. Abraham as a member was announced.

The joint meeting of the Architectural Association with the Junior Institution of Engineers will take place on Friday, February 17, at 7.30 p.m., at the Royal United Service Institution, Whitehall. A paper will be read by Mr. S. Bylander, entitled "Construction of the Building for the Royal Automobile Club."

Professor W. R. LETHABY then read a paper entitled "An Introduction to the Study of Greek Art," in which he said:—

It would be difficult to analyse particular buildings without a large number of illustrative diagrams, and I propose here to attempt rather the general survey of the origins and characteristics of Greek architecture. Further, I want to explain that I am going to be frankly historical, and I am in no manner to be construed as recommending Greek to you as the right thing to study. I believe all these historical studies may be dangerous to those who would actively follow modern architecture, which I conceive of as masterly structure with adequate workmanship. However, the world is a big place with lots of people in it, and historical study is a peculiar aptitude of the modern mind. We have to keep every faculty alive, and we desire not only living architecture, but the most perfect understanding of history. If the question be raised, May not archaeology and architecture be incompatibles? Will not one necessarily kill the other? I reply that I don't think that they need if we have a proper understanding that they are entirely separate things. Great history and the devising of flying machines flourish at the same time without difficulty. I don't see why the faculty for history is necessarily more at war with *resting* machines than with motors and steamships. The question is nearly parallel with that concerning drawing, which has very little to do with architecture, but while it is accidentally associated with it so closely as it is to-day it is necessary that it should be highly disciplined and as perfect as we can make it.

About the year 1800 the remarkable structure now known as a beehive tomb with a richly ornamented doorway, a large part of which is now in the British Museum, was first made known by British explorers. It was on Greek soil at Mycenæ, but seemed strangely unrelated to all that was known of Greek art, and for long the gulf between the two seemed unbridgeable, but constant exploration has more and more filled up the void. Works of a similar kind have been thoroughly examined in the neighbourhood, at Tiryns and Orchomenos, and recent excavations have revealed the Mycenaean type of art at Sparta and many another Greek site, including even Athens itself. It has been found at Troy in the East, and westward in Italy. The culture of which this art was a product was evidently spread over a wide area. Nowhere, however, have such full and continuous evidences been found as in the island of Crete, which is now believed to have been the very centre of the civilisation which produced it. That it might be so is perfectly clear from the traditions embodied in Greek literature. According to Homer, "Crete of the hundred cities" sent eighty ships to Troy, and he mentions by name Knossos, Phaistos, Tiryns, and several others.

In 1865 Captain Spratt, who had surveyed the island, seems to have foreseen the results which would follow on excavation. "At Knossos," he says, "the capital of the island, commerce, education, art, and law seem to have obtained a high state of advancement under its wise lawgiver and king, from the respect with which they are referred to by the earlier authors. It was from Dædalos and his successors in Crete that Greece improved her art and taste. Crete was apparently a school of art and learning in later times, as it had been in that of Minos an early cradle for the arts, forming the stepping-stone between Egypt and Greece, as the natural result of its situation, its naval power, and its commerce."

It was only in 1900 that the systematic exploration of Crete was undertaken, but such great results were almost at once obtained, especially by Dr. Evans, at the ancient palace or palaces of Knossos, that it seemed desirable to find some name which should cover art of this type whenever found. We have got so used to calling it Mycenaean that it is difficult to bring in another name, especially while there is much controversy as to the races who employed it. From the well-known name of Minos, the real or mythical ruler of a Cretan empire, Minoan is now the favourite term, but for many reasons Ægean seems

best. It is held that the most beautiful pottery and metal-work found on the mainland were probably brought from Crete, and that the finer details of architecture, such as gateways at Mycenæ and the carved slabs of Orchomenos and Tiryns, are wrought in a style derived from Crete. Mycenæ and the others were the seats of comparatively petty powers, whereas the island was the centre of an empire, resting on oversea trade, and geographically the outpost of the Northern peoples nearest to the greatest art power in the ancient world—Egypt. We have at the simplest to think of three early cultures which came to represent Africa, Asia, and Europe—that is, Egypt, Babylonia, and the Greek lands, all influencing one another. This Ægean art is the first great European style, and from 2000 to 1500 B.C. it was in many respects the most advanced art in the world.

Only last week a discovery was announced which, if substantiated, will make this art of still greater historic importance. At Phaistos in 1908 a disc inscribed with pictographs was found in a stratum which could be dated before 1500 B.C. A professor in an American University claims to have read this, and to have found that it is written in an early form of Ionic Greek. It records a sacrifice, and the names Zeus and Athene are mentioned on it. He argues, here following Dr. Evans, that it is not of Cretan, but of Ionian origin. He also, without giving details, speaks of having read some of the inscriptions which had their origin in Crete itself, and finds that they are Athenian Greek. If all this is true the story of Greek origins will have to be largely rewritten, as it will show that a Greek-speaking people were seated in Ionia and the islands millenniums before our era, and further that the Ægean art is not merely an underlying stratum which influenced the development of Greek art, but is a highly-developed first phase of Greek art itself. At about 1300 B.C. there were great upheavals and invasions which almost entirely subverted this Ægean civilisation, so much so that except for remains of pottery there is hardly a link which connects the latest Ægean with what is commonly called archaic Greek art.

Doric origins in Ægean art have been treated fully by Dörpfeld. The typical plan of a cella with a portico having columns *in antis* is taken over from what I am calling the parent style. The *antæ* themselves, that is the pilaster terminations of the wing walls, are derived from upright timbers which terminated the mud brick walls. The plinth course, which in mature Greek work is about twice the depth of the walling courses, is a memory of the masonry foundation beneath the brick walls. Puchstein has shown that a remarkable type of Doric capital which is found at Pæstum, which has leaf carving around a throat member, closely resembles the capitals at Mycenæ, and that as Pæstum was founded by the Achæans, there is probably a direct relation between the two. At Tiryns an enriched band was found which has a curious resemblance to the Doric triglyph frieze. It is made up of slabs alternating with bond pieces which rebate over the slabs. Perrot and Dr. Evans have claimed that we here have the origin of the Doric "triglyph motive"; certainly it gives the constructive motive of the Doric frieze.

Ionic origins have not, I believe, been fully worked out, but I have no doubt that they derive also from the earlier stratum.

Over the door of Tomb II. at Mycenæ there was a cornice, the projecting part of which was carved into the likeness of the ends of round timbers. The same thing persisted in Lycia until the fifth century, and there is an interesting length of this type of cornice in the British Museum. It became the dentil course, that is, the principal member, of the proper Ionic cornice, which represents the ends of projecting square timbers instead of the more primitive round ones.

At this same tomb the half columns by the jambs of the door have vertical flutings with sharp edges; such flutings are common alike to Doric and Ionic columns, but more than one engraved seal of the Ægean type show columns with diagonal flutings. Now columns spirally fluted are characteristic also of late Ionic architecture, and it is possible that here again there was some continuity and not a mere accidental re-invention, for an early Poros stone fragment having spiral flutes has been found in Athens, which may well be a link between the primitive and mature architectures. Evidence for reeded pillars has also been found in Crete.

The horizontal band divided into three fasciæ which was adopted on the beams of the typical Ionic entablature is found as a decorative band at Knossos. The door-jambs similarly recessed, like the Ionic architrave, are found at the entry to the "Treasury of Atreus." Another fashion of door-jamb had a flat margin set at intervals with a series of rosettes, like the north door of the Erechtheum. The use of the rosette generally was characteristic of both ages. The most repre-

sentative feature of Ægean ornament is the spiral winding about an eye or a central flower, in a series of perfect volutes. It is now regarded as proved by Burchardt, Puchstein, and Meurer that the Ionic capital derives ultimately from a class of ornamental Egyptian capitals which were themselves based on the forms of lily and papyrus flowers, and Dr. Evans, ten years ago, showed that there were indications of this type of column on the Ægean vases.* It seems to me a high probability that the Ionic capital with the double volute, that is, the Greek lily capital, was actually realised in stone by Ægean artists.

If it be asked whether there is any evidence for continuity other than such likeness, the answer, I think, must be yes. In the Homeric poems this parent art is described with great fidelity. To the Greeks of the early historic period it was evidently a very real ideal. And again, Homer's ideals are in much the ideals of mature Greek art. Stone work was to be polished, and much bronze, gold, and ivory were to be used. Shining, glistening, well-jointed are the favourite epithets. Many of the early monuments remained. Thus the great beehive tomb of Orchomenos was perfect in the time of Pausanias, who speaks of it as the most wonderful building in Greece. In remote districts Ægean types long persisted.

All architectural planning is developed from the construction of primitive dwelling huts. Such structures branched off into the tomb and again into the temple—the tomb was the dwelling of the dead, the temple was the dwelling of a god. The dwelling house became complex in adding cell to cell, but the Greek temple remained a glorified hut, a simple cell. Temples hardly appeared outside Egypt before about 1000 B.C.

Probably the most primitive class of structure is the round hut, but the oblong is almost as simple. Advanced rectangular planning is found in Egypt from the earliest times known. In the Ægean lands the primitive hut is represented by the fine beehive tombs, but there are in Crete and elsewhere rectangular vaulted structures which seem to be as early. We have already seen that the normal temple plan may be traced back to the walls of Ægean palaces.

The circular plan, which attained its final power in that mighty crown, the Pantheon, very probably had a continuous history, although in the background. It seems impossible that when once the perfect species was reached in the beehive tombs of Orchomenos and Mycenæ that it should become extinct. In the shrines over the sacred vestal fires the tradition of the hut with the hearth in the midst was continued. An early Tholos has recently been excavated at Delphi. It was about 22 ft. in diameter and was surrounded by a ring of thirteen Doric columns only about 8 ft. high. It seems to have been built early in the sixth century. The Skias which was erected about the same time at Sparta by Theodoros of Samos must, I suppose, have had the same form. Of the beautiful early fourth-century Tholos at Epidaurus large remains have been discovered, and it and the circular building founded by Philip of Macedon at Olympia are now well known; still another handsome round structure has been excavated at Samothrace of the third century.*

Even the basilican form of plan may have a much remoter origin than has been supposed. Thus, Dr. Evans has found at Knossos a hall of the royal villa which is described as "a pillared hall about 37 ft. long by 15 ft. wide. At one end there is a narrow raised dais separated from the rest of the hall by stone balustrades with an opening between them in which three steps give access to the dais. At the central point immediately in front of the steps a square niche is set back in the wall, and in this niche are the remains of a gypsum throne." Dr. Evans suggests that this pillared hall with a raised tribunal containing an exedra holding a throne and bounded by cancelli is the prototype of the King Archon's house at Athens, and therefore of the Christian basilica. Be this as it may, some parallel or intermediate developments have recently been found. At Samothrace has been discovered a marble temple of the third century B.C. which is said "to anticipate in a singular manner, with its transept, its raised choir, and rounded apse the ground plan of the Christian basilica." A temple dating back to the sixth century has been found at Thebes of which "only a part of an apse remained, recalling the one at Samothrace." And lately some foundations have been uncovered at Sparta of a very early age which are said to have "rude apses," whatever that may mean.

Leaving the question of origins, that is, the continuity of Greek building customs from a very remote antiquity, and the implication that nearly all was tradition, and next to

nothing original design, Professor Lethaby proceeded to examine some of the building customs in detail.

After treating of walls and masonry, plaster and painting, mouldings, casings, stairs, windows and doors, pillars, cornices and caryatides, acroteria, roofs, &c., he proceeded:—In the great period of the fifth century the aim after a perfect type led to standardising arrangements and forms and endeavouring to perfect them along a very straight line. But before the fifth century there are very wide variations in even the simple Doric type. But in the architecture of Ionia variation of detail was aimed at in the same building. In the sixth century temple of Diana at Ephesus all the base profiles are separately designed, the shafts have different numbers of flutes, some even being narrow and wide alternately, and the Ionic capitals are varied like those in a Gothic church.

There is no doubt that the Greek builders delighted in setting out their buildings and their several parts in dimensions which had relations one to another. The idea could only apply to simple buildings like a temple; it could hardly be made to work with complex ones like a modern hotel or town hall. At the bottom it comes very much to a liking for setting out with big dimensions rather than with small ones. As the building was to be perfect every part was related, in theory, to every other part, and a unity was supposed to result because accident was excluded. The real proportions of a structure were, of course, determined by tradition, purpose, cost, situation, and materials; the rest was a slight modification superimposed afterwards, a getting rid of the half-inches, as it were.

A lot of time has been spent in trying to elucidate Greek proportions, for the most part time wasted. If I might I would like to recommend you to put away any hope of solving the question. The idea of looking for such proportions has been a most disturbing factor in the study of Greek buildings, and we hardly have accurate dimensions of any one in feet and inches, because the student was set on evolving some scheme of measures in the modulus of the diameter. If it didn't fit he added on a foot or two and said it must be so. Simplicity, clearness, accuracy, repetition, the eye can estimate, but it takes no heed of the accuracy of the relation of eight to one or the same with 2 in. added or taken away. It is quite an assumption that eight to one is good for a column; it depends on many things, the addition or subtraction of 2 in. might improve it.

It is quite different with the modifications by curvature and other adjustments; here we have something tangible if subtle. These modifications may be used to bring about unity. If the eight columns of a portico incline towards the axis and there is some adjustment in the spacing, you do not have one factor repeated eight times, but together they make up one whole thing—a portico.

Curvature of lines again furnishes an intermediate between the straight and the rounded, between cornices, columns, and sculptures. It takes off the hardness, as we should say. It will correct any look of sagging in horizontal lines, and it varies the lighting on surfaces. Such adjustments are most natural in a highly refined school of architecture and need no explanation.

While I do not recommend anyone to study Greek architecture specially, I can urge those who study it at all to do so in a bold, independent way. This mysterious Greek architecture was but one customary way of doing buildings, after all; and recent researches have shown that in origin the forms are barbaric and accidental—accidental, that is, in the sense that with other conditions they would have been different. There is little æsthetic mystery about the mud walls and wooden props which became a cella and peristyle, or in the overhanging eaves which became a cornice. The wonderful thing is the Greek spirit, and if we would share that we should concern ourselves with perfecting stock-brick walls, chimneys, and downpipes rather than in designing pseudo-dipteral peristyles and Doric triglyphs—that is, as builders: as scholars, let us know all that may be known.

To any of you who may desire to know about Greek buildings, I would suggest that you should work out some one point thoroughly, know all that may be known of a chosen building, and, as far as possible, get close to them and deal with them directly. Much may be learnt in this way in the museums of London, Paris, Munich, and Berlin (I have not seen the last), but I think we shall never gain any real mastery in such knowledge without taking our part in exploration and digging.

Mr. A. T. BOLTON, in proposing the vote of thanks, said they knew that Professor Lethaby had been studying the subject of his paper for some time and had published two or three excellent booklets on it. The history of architecture had been practically rewritten in that paper, and text-books

* On the primitive round hut, see Burrow's "Crete."

were now ten years behind. The Propylæa at Athens was very little dealt with by writers because it was a difficult building. On the stones there was a substance of about the thickness of a piece of paper. It was a revelation to him to learn, after inquiry, that these Grecian buildings were polished by slave labour. There used to be at the Crystal Palace a very valuable model of the Parthenon constructed to show all the curvatures existing in the structure itself. The model has an impressive character not seen in many buildings imitating it, but which will be realised ten times over in viewing the actual temple. The Parthenon is remarkable for the fact that though so small it is so impressive. There is some subtlety about it lacking to many large buildings elsewhere. No time would be wasted by the student which he spent in studying Greek buildings.

Mr. A. E. HENDERSON and Mr. THEODORE FYFE supported the vote of thanks.

Mr. GERALD HORSLEY remarked that Professor Lethaby had gathered up many threads of architectural history and made them into one beautiful woven piece. The paper had also cleared up several points about which they had been doubtful. With regard to what had been said in favour of covering stone with plaster and gesso, this appeared a beautiful way of finishing a building, but was it quite suitable to a northern climate with its hail, snow and rain? A plastered surface suffers from the weather and has occasionally to be stripped and replastered. Moreover, a number of pure white buildings would not look so well in this country as in the south. The Greek architecture was essentially a common-sense architecture. All English architects worthy of the name are inclined to treat their buildings from the natural standpoint.

Mr. WALTER MILLARD thought that the most useful part of Professor Lethaby's paper was not what he had said about Grecian architecture, but the stimulus it contained for students to learn for themselves. All the teaching and instruction in the world was of very little value compared with that desire to learn for oneself. Such a paper did a student far more good and helped him far more than one which plied him with knowledge in a condensed form gathered by someone else.

Mr. ARTHUR KEEN, the president, in closing the discussion, agreed that the great value of the paper was the way in which Professor Lethaby had shown them how to get to the essential root of things. Professor Lethaby had that capacity developed in a most extraordinary way owing to the fact that he was accustomed to follow one line, and follow it right through.

A vote of thanks having been passed with acclamation, Professor LETHABY dealt with some of the points raised in the short discussion. The meeting then terminated.

THE ILLUMINATING ENGINEERING SOCIETY.

THE LIGHTING OF LIBRARIES.

(Continued from Page 88.)

WITH regard to the reading tables. The tops of these are usually level, but many are provided with a slight slope. It is often found that the gloss of a page makes it impossible

FIG. 5.

to read it unless the book is carefully tilted, and when there are the reflections of two or more lights it often requires considerable manipulation to avoid it. In fig. 5 A is a lamp, AB and A'B' the angles of incidence, BC and B'C' those of reflection. On the left side is shown a flat table where the reflection enters the reader's eyes. On

the reverse side is shown a sloping table-top, in which the reflected ray from the corresponding spot is harmless. This does not mean that sloping tables are better than flat ones, because an altered position of the lamp may just reverse the result; but it does mean that the reader should be spared the possibility of such an annoyance, and this can be done not only by each reader having an apportioned space, but that in that space there should be a lifting portion on a rack by which a book can be adjusted to any angle.

Whatever may be the need for free access to our great literature, there exists an equal or greater need for the very best facilities for the study of it, more particularly in view of the increasing degeneration of the eyesight of the modern student, but there is little hope of universal reform until the law steps in to make it compulsory.

THE PRESIDENT said he would now ask the Honorary Secretary to make a short statement concerning library lighting and the recent investigations that he had made.

Mr. L. GASTER, Honorary Secretary, hoped that the result of the discussion would be that the architect would at last appreciate that the illuminating engineer could be of some assistance to him. In the United States, when the Illuminating Engineering Society was started a few years ago, the first president was appointed, in addition to an architect, to act in connection with the lighting of the Carnegie Library. After careful consideration, the architect and the engineer, acting together, came to the conclusion that all naked lights should be avoided if glare was to be absent. In order to avoid glare they used the holophane globe in connection with the central lighting; but, in addition, they installed table standards with shades at a height which not only protected the eye of the reader, but were so constructed that the light was distributed sideways as well as downwards, thus giving a large table area well illuminated. The question had been asked as to what was the proper amount of illumination for reading-tables. In America, for the Carnegie Library, they came to the conclusion that 5 foot-candles was the proper amount. He also mentioned that the holophane globes used in the Carnegie Library had been covered on the top with an ordinary green shade, as it was found that too much light was being wasted in the upward direction. They also put in fittings which threw light right on to the bookcases and away from the eye of the reader. Mr. Gaster then referred to the lighting of the Patent Office Library in London. Much had been said about this, but it was impossible in public buildings to make alterations in a hurry. At the Patent Office it had been discovered that to have rows of chandeliers lighting up the gangways and leave the reading-tables in comparative darkness was of little use. Consequently, they put standards on the tables, but they had been placed in a haphazard manner, and the height also was unsatisfactory. Now it had been necessary to put cardboard round the bottoms of the shades in order to keep the light away from the eye of the reader, although, as a matter of fact, these cardboard additions seemed to be always wobbling about and were never in the right position. In the same way, the central lighting had been expected to light the numerous alcoves, but it had now been necessary to put in additional lamps here, and naked lamps were used. By the kindness of the Patent Office Librarian tests had been made, and whereas, originally, there were only about 1.6 foot-candles on the tables, the amount of illumination under the table standards was now from 10 to 12 foot-candles, and by reducing the number of chandeliers there was a considerable saving in current, amounting to from 200 to 300 watts per hour. At present there was a good general illumination all round with considerable local lighting on the tables. All this was a step in the right direction; but he would make the one comment that the lamps on the Patent Office tables were too far apart, although the Librarian held the view that this was a good arrangement, owing to the large space usually required by readers to place alongside them books which were being used merely for reference purposes. Another example of library lighting was at the Institution of Electrical Engineers' new building on Victoria Embankment. One would expect that such an institution as this would have the very best arrangement, but here again was the old story of the gangway lighting, because the architect wanted to have it symmetrical. In many parts of the room there was only 1 foot-candle on the tables, and that was not good enough. He would not condemn this room too strongly, because he believed it was still being experimented with, and he felt sure that they would instal table lamps. In connection with this question, the Assistant Honorary Secretary, Mr. Dow, had been round to many of the public libraries in London,

and had compiled some figures from actual measurements. It was at any rate some satisfaction to know that such measurements could be taken, and it pointed to the fact that with co-operation scientific illumination could be brought about.

Mr. J. S. Dow, in the first place, recorded his thanks to the various librarians who had afforded him facilities and assistance in making the various measurements referred to by Mr. Gaster. In giving a few of the results, he did so with the desire to show how a few things might, perhaps, be improved; and if he criticised occasionally, it was merely with the idea of being helpful, and not hypercritical. What struck him most had been the great diversity of conditions in the different libraries. They could not refer to library lighting as one subject, by any means. For instance, the Royal Colonial Institute Library was more like a club room; the library at the British Museum, where students read, was, again, different; a reference reading-room in a public library was different to the reading room, and that, again, was different from the lending room. In each case they had to consider what the room was meant for and to illuminate it accordingly. His impression, as a whole, was that he rarely met a case in which the intensity of illumination on the books was seriously too low. In some cases it was not as high as it might have been; but, on the whole, the results were fairly satisfactory, except for the defect of leaving exposed lamps, which affected the eye of the reader. This was certainly a defect in a great many cases, but it could easily be overcome by quite a small change in the nature of the shade used. Another point was that in most cases there was local lighting, plus some form of general illumination; but the exact arrangement seemed to depend upon the nature of the room and the brightness which was to be allowed on the surroundings. Professor Weber had laid it down that when the ratio of the brightness on the book to the surroundings was more than 100 to 1, then there was an effect which was trying to the eye. He did not come across any case in which that existed. On the other hand, in a reference room the surface brightness of the walls was nearly always more subdued, and librarians seemed to instinctively realise that bright and cheerful surroundings were necessary in a reading-room; whilst in the students' place a more subdued illumination was appropriate, so that the reader was naturally more inclined to concentrate his attention on the book in front of him. Therefore, in order to study that, he took measurements, not only of the actual illumination on the table; but the vertical illumination on the bookshelves, and also the surface brightness of the surroundings. He had collected an immense amount of material, but there was no time to deal with it that evening. He, therefore, only proposed to give one or two of the chief results as affecting special points that struck him in connection with the investigation. At the Islington North Library there was general lighting, with fairly light surroundings. There were also opal shades with metal filament lamps, which were naked. The illumination on some of the tables was about 2 foot-candles. This was not bad, but it was not so high as it might be. In his opinion it would be better if the lamps were frosted. In this connection it was curious that so few frosted lamps were used in public libraries, the idea being, apparently, to save every inch of light possible. But he believed they would be able to see better if frosted lamps were used, in spite of the lower light, as it would make the glare less. In connection with the class of shade used at Islington, he did not think this gave a scientific illumination. It was necessary to select a form of shade—and he believed it could be done—which had a polar curve, so that it would throw much more light sideways than downwards. In fact, one could easily scheme out a form of polar curve which would be ideal in this respect. At the Fulham reading-room the lamps were badly arranged in respect of the newspaper reading-racks. At one part of the sheet there was an illumination of 4 foot-candles and at another only 0.4 foot-candle. For these racks some method of inverted lighting would be best. The same thing applied to shelf lighting to some extent. In this particular room at Fulham he found that there was a brighter light on the ceiling than there was on parts of the newspaper, viz. about 5 foot-candles. A rather interesting feature of the lending library at Fulham was the illuminated signs over the bookshelves. But the light in this room was not scientifically distributed, although it was an advantage to have the lamps screened to some extent, as was done. The students' reference library at this library was one of the most pleasant rooms he had come across. The table standards were fitted with green shades, which kept the light from the eyes, and there was absolutely no glare. It was not a very efficient shade, but

the illumination of 3 to 4 foot-candles was ample, whilst the surface brightness was about 0.3 foot-candle. There was thus that subdued lighting which was required in a room of this character. At the Islington Central Library the arrangement of lights was rather curious, being in a series of lines of seven lamps each. It seemed to be something mystical, from the architect's point of view. They were rows of naked lamps with little metal shades at the top, which, whilst it might be æsthetic, was quite hopeless from the illuminating engineering standpoint. It meant that a large amount of light was thrown against the shade and wasted, or thrown upwards; it never reached the tables. With the other lamps in this library there had been an attempt to shade the globes, but the ends of the lamps projected below the shades and affected the eye of the reader. The lighting of the Surveyors' Institution was one of the worst examples. There were lights in the gallery, but on the floor there were only clusters. In the various bays, in which there were bookshelves and tables, the illumination on the tables was only half a foot-candle, whilst on the bookshelves themselves it varied from 0.4 to 0.15 foot-candle. As a matter of fact, the whole impression was that these bays were much darker than they really are. Another curious feature was that the watts per square foot are quite high—as high as in plenty of much more successfully lighted buildings. Further, the lamps were in shades, but the ends of the lamps were visible to the eye. The characteristic of the table lighting in the Patent Office was the distance between the standards, the reason for which had been mentioned by Mr. Gaster. The result was that the light was very far from uniform, being very high under the lamp but tailing off at the sides. At the Fulham reference room there was a satisfactory protection of the lights by green shades, and the lights were also closer together on the tables. At the Royal Colonial Institute they had holophane chandeliers with no special lighting for the shelves at all, but, owing to the surface brightness, this lighting was quite good. In conclusion, Mr. Dow emphasised the point that the figures obtained for all the libraries which he had investigated varied very greatly. He had taken the watts per square foot and the illumination in foot-candles on the reading-tables, on the shelves, and on the attendants' counters in some cases. He had also investigated the surface brightness of the surroundings in foot-candles, and striking inconsistencies were shown, even in the same library. One of the most satisfactory was the British Museum Library, because of the freedom from glare. There was an immense dome with five arc lamps hung very high up with specially frosted globes. There were also 300 shaded table-lamps, and in spite of Mr. Darch's criticism the illumination of these tables struck him as very favourable. It was from 3 to 4 foot-candles in every case in which he got a reading. The lighting of the shelves also commended itself to him, as the light was hidden from the eye, but at the same time there was need for a reflector which threw down an absolutely uniform light. This would give the same illumination for a fraction of the power, as the light would then be distributed in a scientific way.

Mr. L. C. WHARTON (British Museum) said that in the place where he generally had to work he had to contend with his own shadow; but this was not a feature of the lighting of the British Museum, because in the reading-room it was possible to read at any one of the tables quite comfortably. It was even possible to read by the aid of the arc lamps alone in places where there were no standard lamps. Beyond this he knew nothing about the system of lighting the British Museum.

Mr. H. V. HOPWOOD (Patent Office) wished to make it clear that the lighting of the Patent Office Library was in a transition stage, and that experiments were still going on. In his opinion this was not a problem of lighting libraries in general, but of giving the reader in any particular library exactly what he wants, under varying circumstances, which latter might be due to differences in the reader, in the architect, or in the building. With existing buildings they had to deal with what they had, and the lighting must be suited to existing circumstances. He did not wish the Patent Office Library to be compared with any ordinary library. There was, perhaps, a different type of reader there—not the man who came to read a book from cover to cover, but the man who was searching and comparing, and they always had to give him plenty of room; not necessarily for the book he was reading, but for other books which he wished to consult; and this explained to a large extent the wide space between the standards on the tables. He thought the varying amount of light on the Patent Office tables was advantageous; for a man studying engineering drawings, for instance, had the

advantage of bringing them right under the lamp and of having a less illumination when he wished to read ordinary matter. An adjustment of from 0.17 to 4 foot-candles, he thought, was a very useful condition of affairs. As regards the rest of the library and the lighting of the book stacks, he preferred to say nothing. He admitted that the lighting at present was not satisfactory. He believed that it could be altered, and not extravagantly. As a matter of fact, by the new arrangement that had already been adopted a saving in current had been made.

(To be continued.)

BRITISH SCULPTURE OF TO-DAY.

AT Carpenters' Hall, London Wall, on Thursday last, Mr. M. H. Spielmann, F.S.A., gave a lecture, copiously illustrated with lantern slides, on "British Sculpture of To-day." He said the object of the lecture was not to deal philosophically with the theory of sculpture as that would be impossible in the brief time at his disposal, but his concern was with the school of sculpture which had arisen in Great Britain within the memory of some present, and he intended to illustrate as great a number of works as possible and offer such criticisms and suggestions as might properly be expressed in respect of the efforts of men who were for the most part happily still amongst them. He wished to place before them certain facts in relation to an art as a rule overlooked by the general public, for whom sculpture usually meant a plaster nymph, a bronze gentleman, or a marble angel. Since 1875 a great change had come over British sculpture, so revolutionary that it had given a new direction to the aims of our artists, and had raised the British school to a level unhoped for, or at least entirely unexpected forty years ago. He did not pretend that the British School of Sculpture equalled in technical expression or the elasticity of imagination the schools of France or of Belgium. The French school, prominent for the most part rather than really great, with one or two notable exceptions, had been built up upon the national traditions of many generations of their sculptors during many centuries. On the other hand, British sculptors, awakening to a feeling and appreciation of plastic beauty, found themselves practically without a past of their own to inspire them. They found no national tradition, and competent as they were to found a national school, yet they had to begin at the beginning. The awakening was largely brought about by Leighton and Alfred Gilbert and in a lesser degree by Onslow Forbes, and since then the whole conception of sculpture in England had been modified. It was difficult to realise how bad their sculpture was seventy or eighty years ago. It was then said they had four classes or grades of merit in the monuments in Great Britain—"bad," "worse," "worst," and "worst of all." Men began to look around them and seeing what was done asked themselves, "Is this sculpture; is it art?" They chuckled at the equestrian statue of George III. close to Waterloo House, and declared that they had never seen so drunken a horse and so sober a rider. The fact was that King George commissioned Wyatt to execute a group of St. George and the Dragon, but before it was finished the King died and by order of the Government of the day St. George was changed into the king; the spear was exchanged for a cocked hat, and breeches and Hessian boots covered the muscular limbs of the brawny saint. The dragon was removed from the horse, which was left startled as well it might be. Thackeray said he once took a French friend to the Wellington statue who exclaimed, "Ah, Waterloo is avenged." Ignorance of sculpture was confined to no class and it was to be found inherently in the highest official classes where appreciation was most earnestly to be desired. He was glad to say this was not the case with the present Chief of the Office of Works. There was an idea abroad amongst sculptors and the public that a Minister of Fine Arts such as existed in France would ensure support to artists and good art to the public; but the only way for a nation to obtain good art, said Ruskin, was to enjoy it. A safe way to ensure bad sculpture would be to appoint a Fine Arts Minister from amongst their distinguished politicians. They would remember probably an instance of official taste when not long ago the Premier in the House of Lords and a Cabinet Minister in the Commons poured jesting scorn on one of the finest modern works of architecture in England. He referred to Mr. Norman Shaw's New Scotland Yard. No wonder that Canova hearing their enlightened classes repeat commonplace opinion about sculpture exclaimed, "You Englishmen see with your ears." Knowledge was not everything, for there was taste, and taste must be trained lest it be corrupted by the shallow and

meretricious in art which was more dangerous than mere incompetence. Bad taste was worse than no taste at all; for "no taste" might be educated, but bad taste was vicious altogether. How vicious and bad it could be might be seen in the extraordinary popularity of the clever trash from Italy which attracted crowds around it in the popular exhibitions and in the open sale places of their great towns. It might be clever in its way, but it aimed primarily at astonishing the neighbours. It was work which was tricky, dodgy, simply imitative, distinguished by false and over false sentiment, and lacking all appreciation of elementary propriety. The sculptor who did such work and did it successfully was like the man who toiled and got his strength and agility by turning big summersaults for the delight of the crowd. Chief amongst the characteristics of their modern school was an effort towards such realism and picturesqueness of treatment as would not detract from the dignity of the conception. They had not yet arrived at the unsculpturesque attempts to render atmosphere and momentary impressions in marble and bronze. They remembered that sculpture must primarily represent ideas and not things, for as Michel Angelo has said, "The nearer painting is to sculpture the better it is; the nearer sculpture is to painting the worse it is." The present aim was to give life without undue realism—to suggest the reality throughout in beauty and grace. The nude must always remain the symbol of the ideal personality and not merely of human beings deprived of their drapery. The aim of art was beauty. Clothes were the outcome of necessity and what had art to do with necessity? It was not only beauty of form which attracted the sculptor but beauty of movement for its own sake, as developed in the play of the muscles and joints and in the art of expression. All this was concealed by drapery. It was not surprising that the art of sculpture was little understood in this country or indeed by the general public anywhere, and especially in this city of London, for the eye was ever more affected by colour than by form. Again, while painting was frankly illusive sculpture appeared to be imitative, although it was nothing of the kind. Its beginnings were more easy than any other art but its endings more difficult. The form was without colour and atmosphere and tone; without landscape and other accessories suitable for pictorial treatment. Whilst the painter could take almost anything for his subject the sculptor was restricted, for in sculpture the model had to be idealised or the result was commonplace. This being so the introduction of colour necessarily condemned itself, for the more a statue looked like a real man the less it looked like sculpture and the more like a waxwork. On the other hand, a single colour was no colour sculpturally treated, so that whether they set up in their public places a white man or a brown or a green man they must recognise in him a certain nobleness of aspect and qualities above others which justified perpetuation in sculpture of the memory of any man. Until Alfred Stevens scarcely anyone in this country thought of instilling real life and blood into clay and marble. Stevens realised not only life itself, but dignity, nobility of form, and movement previously unknown in British work. A follower of Michel Angelo and the Italian Renaissance, he was entirely a personality and no copyist. He was in the right sense unconscious of his own greatness, and had not the accident of an open competition brought his genius before the world he might have gone on teaching and designing furniture and fire grates with the occasional relief of painting portraits or occasional decoration. One of the secrets of his success was his knowledge of construction, and his feeling for architecture helped him to treat architecture with fine decorative effect. His memorial of the Great Exhibition, which was never carried beyond the sketch, showed his practical ability and the intellectual force of his imagination. His great sketch for the Wellington Memorial had similar qualities and he would not enter into the bitter debate on what he held to be the scandalous treatment of this supreme national treasure. Thomas Woolner had done work almost as fine as Greek. Sir E. Boehms's best known work in London—the Wellington Memorial—was cold, although doubtless correct enough; but it seemed more like an enormous chimney ornament. Foley, who at first was all for pure style, threw his pretensions to the wind with his statue of General Outram, now in India. Meanwhile Armstead was attracting attention with his work at the Colonial Office, and his statue of Lieut. Waghorn at Woolwich. The crowning merit of Armstead's work was its unornamental character and its sense of style without any chance effect. George Lawson had a genuine sense of style and only just escaped general recognition as a fine sculptor. His "Motherless" was correct and admirable, Scottish in sentiment and full of pathos, yet he thought too pictorial for

sculpture. Brock entered Foley's studio when he came to London in 1866, but he was courageous enough to modify his style when already formed and when his career was already assured, and so developing, he left his master far behind. His "At a Moment of Peril" was followed with "The Genius of Poetry," but he reached a higher point with "Eve." In his "Gainsborough" he seemed to have realised in the marble the very technique of the painter, whilst in the statue of Dr. Philpot at Worcester the treatment of the drapery was most striking. His statue of Professor Sir Richard Owen showed much the same handling. From that they turned to a work more admirable still in feeling—the bust of the late Queen Victoria, one of the noblest, most dignified and characteristic works of this class exhibited in England. This work heralded what was recognised as Brock's masterpiece—the tomb of Lord Leighton in St. Paul's Cathedral, which was a monument one felt the late President would have rejoiced in, for all was joy, beauty, tranquillity and peace. Proceeding to show portraits of the plaster model for the Queen Victoria Memorial in front of Buckingham Palace, soon to be unveiled, Mr. Spielmann said it was intended that Mr. Brock should have spent twelve months in travelling to see the monuments in Europe so that he might be helped if possible. Unwilling, however, to go without doing anything, he made the sketches for King Edward and they were accepted at once. The monument was 75 ft. high. This great work was intended ultimately to be only one incident in the great scheme of the Processional Road if ever it came to a final completion. To give some idea of the magnitude of the work he might say the whole of the monument which stood upon a platform was 2,500 tons in weight. He thought that Mr. Brock was wise in deciding to follow traditional lines in this great work, for it was not the occasion, as some held it to be, to run risks by striking out into a new track. He had followed the work which was not only personal to the sculptor, but thoroughly modern in treatment, and it could not be doubted but that the complete work would be the crowning triumph of Mr. Brock's career. Sir C. Lawes-Wittewronge was always strong and healthy in his work and his figures were full of movement and life. Mr. Hamo Thornycroft with "Teucer" reached the high-water mark of his early career—it was instinct with life and noble in form. On the other hand, his "Sower" obviously inspired by Millet was a different study in which modern dress had to be treated, but what the sculptor lost in the human form he gained in action and movement. In the national memorial to Mr. Gladstone in the Strand they had the *magnum opus* of Mr. Thornycroft in size if not wholly in quality. The figure itself faithfully and impressively reflected the character of the man in his robes as Chancellor of the Exchequer. A prominent example of the realism in Thornycroft's work was the Gordon statue in Trafalgar Square, most suggestive of the dignity and benevolence of the hero—it was one of the finest statues in London. For a contrast they had the statue of Dean Colet, the founder of St. Paul's School. Mr. Havard Thomas was one of the most serious minded and artistic of their sculptors, as was seen in the public monuments to Samuel Morley and Gladstone. E. Onslow Ford, who was lost to them before he passed middle age, made his first success with the figure of Henry Irving as Hamlet, which was a well conceived piece of realism, romantic and verging on the theatrical, which was exactly what an actor's portrait should be. This was now in the Corporation Art Gallery. His bust of Huxley was more strikingly sculptural, but his Gordon at Chatham was more open to criticism on the question of multitudinousness of ornamental details. Therein he thought it overstepped the boundaries of what was allowable in sculpture, for it gave the sense of a large ornament. His Shelley monument was finer in its parts than in its entirety. His work always charmed if not of the highest class. He would have gone further if he had been more restrained in the matter of ornament, and yet his work reflected the character of a man whom they all admired. In 1877 Leighton burst upon the world with his "Athlete Struggling with a Python," and if this had been dug up in other soil he wondered what would have been said of it. It was the greatest achievement in its own way that had ever been produced in the world, and yet it was felt to be lacking in that kind of humanity which every great masterpiece must exhibit. Leighton, however, said that he had gone for pure beauty and expression of form to the exclusion of all sentiment. But then came the "Sluggard," which, although simpler in detail, was a higher accomplishment than the "Athlete." It was just as Greek as the other in its devotion to form, but instead of representing the action of occurrence it had the higher conception and some of the mystery which

was distinctive of the finest art in ancient times and which in modern sculpture generally was so notably deficient. Yet the sensation made by Leighton's sculpture and mastery seemed to have had no direct follower amongst the younger men. The lecturer proceeded to speak at considerable length on the work of Mr. Alfred Gilbert, whose position in the art world, he said, had long been proclaimed by his brother sculptors and the public. It had put him on a pedestal so high that his artistic reputation was almost beyond harming, even by himself. Rarely had a man burst on a world with a message of hope translated into more brilliant achievement. His great qualities were seen in his effigy of John Howard at Bedford, full of character, with a spiritual as well as a physical side. It foreshadowed the Shaftesbury Avenue fountain; but greater than these was the magnificent colossal statue of Queen Victoria at Winchester with which his name would ever be associated. The work was a veritable masterpiece, even although it had so much of goldsmithery in it. It afforded an object lesson as to how much a masterpiece of sculpture was cared for in this country. The monument was designed for an interior, but the Municipality found there was no room for it. Eventually it was set up in a public garden, but the indifference of the authorities to this treasure of art had developed in a worse form in the populace, who robbed it of many of its beautiful features. No wonder that Gilbert was broken-hearted and declared his unwillingness to consider any scheme of restoration. The lecturer also touched on the Duke of Clarence Memorial at Windsor, and said Gilbert was not to be considered as a mere sculptor but as a sculptor and romanticist in one. When they remembered that England produced him as well as Flaxman, Stevens, and Watts they might well ask if form was indeed foreign to the temperament of this country and if sculpture was really an exotic in the land. In "Pandora" and "Hounds in Leash" they saw the work of Harry Bates, who in his short life did splendid work for the British school of sculpture, and the photographic productions of his beautiful reliefs went into homes which never before had known what sculpture meant. In Sir George Frampton they had one of the most versatile artists of the day. Highly accomplished, he was at home in every branch of art and covered the whole field. His latest work was a statue of Queen Mary intended for India. Frampton had great powers as a designer and hardly less as a modeller, although he did not like his technique to intrude upon the eye. Mr. H. Pegram, who attracted attention when little more than a youth, always showed an appreciation of sentiment and his work was full of movement and life. In dealing with Mr. Alfred Drury's work they had always to remember that one test of the sculptor was his rendering of young children and young forms. Yet the public was always more taken with the easier forms of old age—it was always easier to make marble screech than sing. Quite recently Mr. Drury had carried out a series of colossal groups which was one of the architectural features of the new War Office, and although seventy feet from the ground and utterly thrown away at such a height, those who could see them recognised them as fine. Of his purely decorative architectural work they had the Vauxhall Bridge panels and the work executed at the house at the corner of St. James's Street, Piccadilly, built by Mr. Belcher. Mr. Pomeroy was somewhat bewildering, for he could work in every style. His Robert Burns at Paisley was one of the most refined and unique effigies of the poet. His statues, like that of Dean Hook, were strong and fine presentments of life and they stood well. There was fine poetry in much of Mr. A. Toft's work. Professor H. Lanteri, of the Royal College of Art, had produced much admirable work, and as a teacher he had no superior. Mr. Goscombe John, while quite a student, established a reputation for the refinement and feeling in his work which had been sustained by his austere figure of St. John the Baptist and the Duke of Devonshire's monument at Eastbourne. Mr. Bertram Mackennal's work for the Local Government Board offices in Parliament Street was the best modern work of its kind in England. There was little doubt that in the future he would take his place very near the head, if not quite the head, of British sculpture amongst his contemporaries. His work was marked with an exquisite appreciation of the value of form and the general effect as a whole. They could expect better work from Mr. Fehr than they had yet had. His "Fallen Angel" showed great strength and great weakness. Most visitors to London knew one of the earliest of Mr. Colton's works—the Mermaid Fountain in Hyde Park, ordered by a Chief Commissioner of Works during a lucid interval. More admirable was his "Crown of Love." When Mr. David McGill exhibited his "Hero and Leander" it was thought he was a disciple of Harry Bates, but his

"Bather" was different. Dr. McGillivray was by far the most able sculptor in Scotland and had had much opportunity in Edinburgh. Mr. Derwent Wood harked back more or less on tradition, but he was a man who might challenge the ultimate supremacy of Mr. Mackennal in the future. His work was marked with strong character and serious thought. Mr. Alfred Hodge's work involved the whole theory of relief in relation to architecture. It was remarkable in style and character, and to some extent was overforced. His relief of "Commerce" was very low in relief in reality, the sharpness and boldness of the modelling and the almost exaggerated under-cut giving the effect. Mr. Richard Garr was producing work of real power, and Mr. Reubens Shepherd's work was sincere. In conclusion, Mr. Spielmann referred to the work of Geo. F. Watts, who, as a sculptor, gained their respect and enthusiasm. His half-dozen works, which included the recumbent effigy of Bishop Lonsdale at Lichfield, the equestrian statue at Eaton Hall, and the colossal statue of "Vital Energy" placed near Cecil Rhodes's tomb in South Africa, were masterpieces. He asked if the work of this grand old man did not mark for them a true standard; did it not point out the way to those of their younger sculptors who were too easily led away by the fashion of the moment?

MANCHESTER SOCIETY OF ARCHITECTS.

ON Wednesday, the 8th inst., Mr. F. W. Jackson read a paper entitled "The Village." He first reviewed modern conditions and tendencies in art, and compared them with the conditions under which the great works of the past were produced, and then passed on to the study of the buildings of a village on the north-east coast of Yorkshire, the village of Hinderwell.

It was of no antiquity, its church ordinary, if not ugly, but with a little search the rise and fall of its craftsmen can be seen.

At one time there was something of the picturesque, but that element has almost gone. The old cottages show signs of a life that could appreciate beauty; these qualities are not to be found in the newer ones. Then one could find among the tombs in the churchyard many with merit in their design and lettering, but who would visit the modern cemetery in search of beauty, although the modern mason is more expert? This leads one to consider what is happening to the dwelling houses of our people. We found in our village half-timber and plaster villas from the city suburbs that seem to fear the dashing waves driven by our north-east gales. They know they have not come to stay and are for the summer only. He showed a sea-captain's house. The stone of the district would not do. He must have red Accrington bricks, coloured glass in the entrance porch, big clumsy windows and cast iron railings. Opposite was an old house, such as could be found in any village. How unfavourably the up-to-date one compared to it. Mr. Jackson showed other examples of this contrast. He was no believer in the cry that we were a decadent people. We have become possessed of materials and facilities that the world has not known before in all the arts. The problem for students was how to adapt these modern conditions. It was no good to ignore them: we cannot in our village get the blacksmith, or the joiner, or the mason of the days of yore. As a painter he deplored the colour of many of the new materials now in use in these smoky districts, and he thought the thing to strive for in our towns was bigness of massing and a fine skyline.

UNIVERSITY OF LONDON LECTURES ON ARCHITECTURE.

(Continued from last week.)

AGAINST the wall of the immense reservoir, seats for the spectators of the Stadium were built, rising tier above tier. The principal block of the *Thermae* was placed near the main entrance, at the north-east extremity of the grounds. To this block there were only four entrances on the north-east side which was exposed to the cold winds, but the south-western front had many openings. The whole block was laid out on axial lines, the *Tepidarium* being the central point from which a magnificent vista right through the building could be obtained. This splendid hall, 170 feet long by 82 feet wide, was divided into three bays and covered with three cross vaults, the soffits of which were richly treated with stucco in relief, coloured and gilded. The vaults were supported by immense granite and porphyry columns 38 feet high and 5 feet 4 inches in diameter, surmounted by a "returned" entablature, which however only occurs over the columns and is not carried round the rest of the hall. The walls were 14 feet thick, faced with marble; semi-

circular recesses with smaller columns in front were used for warm baths. Light was admitted by clerestory windows, obtained by the intersection of the cross vaults. The St. George's Hall at Liverpool is the same size, but is divided into five instead of three bays and covered with one large barrel vault instead of three cross vaults.

North of the *Tepidarium* was the *Frigidarium*, an immense cold swimming bath, marble lined. It is believed to have been open to the air above the water. In order to admit light a wonderful panelled ceiling with gilt bronze girders is said to have covered the remaining portion.

South of the *Tepidarium* was an ante room which led to the *Calidarium*, a large circular hall 116 feet in diameter, but as to which, and the possibilities of covering the same with a dome owing to the thinness of the projecting walls, there seems to be some doubt; it is thought that the façade presented a high semi-domed apse, in which were several recesses containing the hot baths. The apse was heated by means of a hypocaust floor and the walls lined with hot air pipes behind the thin marble facing.

The baths in the recesses were heated in a like manner with a hypocaust furnace under each, and hot air flue-tiles running up the wall. The smoke from the furnaces was carried right up to the top of the building. There are some interesting examples of the flue-tiles and bathers' implements to be seen at the British Museum, and at Chedworth, near Cheltenham, there is a private bath with its hypocaust and flue-tiles.

The floors were laid with coloured marble mosaic, the designs representing athletes and various other subjects; richly coloured glass mosaic was used for wall decoration and apses, in which marble statues were placed.

The *Thermae* of Agrippa, Nero, Titus, Trajan, Diocletian and Constantine were more or less on the same principle as those of Caracalla, though they varied in the distribution of their parts. The *Tepidarium*, however, was usually the central point and the whole always laid out on axial lines. Besides these there were hundreds of private baths in Rome, to say nothing of those in almost every private house, heated in the same manner.

Mr. Banister Fletcher, F.R.I.B.A., dealt with the theatres and amphitheatres on January 31, at the British Museum. The Roman theatre did not differ very materially from the Greek, except in the fact that the Greeks always chose the natural slope of a hill out of which to excavate their auditorium, building up only the "skene" or stage wall, whereas the Romans constructed the whole building by means of radiating walls with concrete vaults.

The method was far more costly, but rendered possible the erection of vast edifices, such as their theatres and amphitheatres, on perfectly level ground. An exception to prove this rule is the theatre of Herodes Atticus, which is hollowed out of the Acropolis rock, and partly constructed just as in Greek times.

Most of the Greek theatres, including those in the various states and colonies, were altered and adapted to suit the requirements and tastes of the Latin conquerors, one of the few examples which escaped being the theatre at Epidaurus.

The auditorium of the Greek theatre formed about two-thirds of a circle, whereas in the Roman theatre it only described a semicircle on plan: the central portion or "orchestra" of the Greek theatre, which was a complete circle and in which the dancing and singing took place, was now included in the auditorium, at the same time being converted into half a circle. It was here that the places were reserved for the senators and people of rank, slightly raised wide marble platforms indicating in certain instances where formerly the beautifully carved marble seats of the dignitaries had stood. Many of these seats, as well as those on the podium at the Colosseum, came originally from Greece, and were removed in later times to serve as bishops' thrones in the apses of the early Christian churches.

The stage, which was long and comparatively narrow, was brought forward and became a more important as well as an architectural feature, owing to its permanent nature. It had three entrances, and at the back were dressing rooms, &c., for the use of the actors. It usually had a timber roof which sloped outward towards the auditorium in order that the voice might carry. The rest of the building was covered only with a *velarium*: pierced corbels which received the poles to which it was attached still exist in many of the ruins.

The seats for the spectators were arranged in tiers one above the other, usually a wide *diazoma*, as in the Greek theatre, permitting access from one end of the auditorium to the other. Wide passages and staircases communicated with the external galleries on each storey, in which the audience could take shelter in the event of a shower of rain. A large drain encircling the orchestra carried off the rain-water which fell into the theatre.

Examples at Rome, Orange, Athens, Taormina, &c., were all dealt with in detail by the lecturer.

✦ The amphitheatre was a building essentially characteristic of the Romans, whose love of wholesale butchery contrasts so strongly with the athletic as well as the more refined intellectual pastimes of the Greeks. Its shape was determined by placing together the centres of two theatres, omitting the stages, hence its name. In their successive conquests the Romans carried their customs with them, for an amphitheatre is to be found in almost every Roman settlement; near Dorchester there are remains of one measuring 220 feet long, dating from the time of the Roman occupation.

Gladiatorial combats, which were held in the amphitheatres, had a religious origin which probably came from the Etruscans. Human sacrifice was offered to the "manes" or tutelary spirits of the dead, the mortal combat originally being held in connection with the funeral of some important personage. The slaughter of human victims continued till the year 403 A.D., when the heroic act of an Oriental monk, named Telemachus, who threw himself into the arena as a protest against the awful practice, brought about its final abolition.

The building of the Colosseum was undertaken during the reigns of Vespasian, Titus and Domitian. It was first opened to the public in the year 80 A.D., and was always spoken of by the Romans as "the Flavian," from the gens to which Vespasian belonged. As built by these emperors the upper galleries, beyond the third arcade, were of wood, and continually being destroyed by fire, until erected in stone towards the middle of the third century A.D.

It covers an area of 620 feet by 513, being an ellipse on plan. It has eighty openings on each floor. Those on the ground are numbered to correspond with the blocks of seats inside, for which ivory tickets with the number of the seat and the block and row were issued.

The arena is an oval of 287 by 180 feet. The surrounding podium, on which were placed the thrones for the Emperor and Empress, the Vestal Virgins, the Pontifex Maximus and other dignitaries, was raised 12 feet above the level of the arena; this was also protected by a gilt metal screen with revolving upper rail, to allow no hold in the event of a wild beast making a sudden spring.

The auditorium is constructed of wedge-shaped piers, radiating inwards with raking vaults running downwards to the centre; travertine is used where the greatest pressure has to be met, tufa where there is less weight, and concrete made of soft tufa or light pumice stone for the vaults, which were faced with hard marble stucco in relief. The seats in the auditorium were faced with marble, of which they were stripped in later times.

The dens for the animals were below the podium on a level with the arena, beneath which were wonderful passages and other dens, also appliances for scenery and lifts for producing wild beasts suddenly.

Externally the "orders" are used decoratively, being attached to the piers which support the vaults. The Tuscan, Ionic and Corinthian "orders" are used for the three storeys of colonnades, the upper fourth storey having Corinthian pilasters. Corbel stones of travertine, corresponding to holes in the cornice, 14 feet above them, held the posts to which the velarium was fastened.

The massive blocks of travertine of the façade were attached to each other by means of iron clamps, which during the Middle Ages were removed, leaving the present holes. It is supposed that iron must have been very scarce, as the labour which the removal of these entailed was very great.

The eighty exits afforded by the arcades all round the Colosseum enabled the vast crowds to disperse without confusion. The building was said to hold 87,000 spectators.

The circus was an adaptation of the Greek stadium, but unlike the latter, which was used for foot races and athletic sports, the Roman circus was only used for chariot and other horse races. The Circus Maximus was the oldest in Rome and situated between the Palatine and Aventine Hills; it was originally only filled with wooden seats. The Circus of Maxentius on the Via Appia, two miles from Rome, was built in the year 311 A.D., and is the best remaining example.

The circus was a long arena, circular at one end; along the centre was the "spina," a long, low wall which separated the going from the returning charioteers. It was slightly inclined to one side, being wider towards the starting-point to allow more room for the chariots. On the spina were placed obelisks, ædiculæ, statues, &c. The starting-point was formed by a row of small vaulted chambers or "carceres," which the competing charioteers occupied.

According to Pliny the Circus of Maxentius held 250,000 spectators. With most of the other buildings in Rome, it served to feed the limekilns of the city during the Middle Ages.

GUILD OF ARCHITECTS' ASSISTANTS.

THIS body at a meeting held at Prince Henry's Room, Fleet Street, on February 7, had before them a "Mock Arbitration Case," arranged by Mr. J. Gerald Large, P.A.S.I.

The case was assumed to have arisen through certain amendments being demanded by the district surveyor, the architect refusing to accept the surveyor's interpretation of the Act. The builder, however, carried out the instructions of the district surveyor, contending that he had power to do so, as provided by Clause 5 of the R.I.B.A. Contract. The result is a dispute between himself and the building owner, the matter being referred to arbitration for settlement. The building owner makes a counter-claim for damages.

Mr. J. H. Elder Duncan, Vice President, in the Chair, acted as arbitrator; Mr. J. Gerald Large, P.A.S.I., counsel for the plaintiff, Mr. J. V. Hibbert, F.S.I.; Mr. S. Douglas Topley, A.R.I.B.A., counsel for the defendant, Mr. John F. Burkinshaw, Messrs. H. C. Bishop, A.R.I.B.A., F. R. Chalmers, E. J. Dixon, A.R.I.B.A., and T. H. B. Scott as witnesses.

The proceedings were entirely formal in character, resulting in judgment for the plaintiff, both claims being well contested, and the members taking part showed much enthusiasm. They would, however, probably find it a rather more serious matter giving evidence in a material case in real practice before an arbitrator.

The evening was undoubtedly instructive to those members whose professional experience has not been associated with arbitration cases, and one of the objects of the Guild is to help its members in matters of professional interest not always afforded in the office.

OUR CONTEMPORARIES FROM OVERSEAS.

THE *American Architect* (New York) gives us illustrations of some country houses by Mr. Guy Lowell, Messrs. James S. Lee & Davis, and Messrs. McGrath & Kiessling. These are all examples of the use of stucco finish for external walling. An article on the Leaning Baptistery of Pisa by Professor Goodyear shows that this building is built not vertical but at right angles to the sloping surface of the ground on which it stands, so that there is an inclination of 15 inches from west to east.

Berliner Architekturwelt (Berlin) has this month for its principal subject the Kaiser Wilhelm Academy at Berlin, of which Messrs. Cremer & Wolfenstein are the architects, and which has been five years in building from June, 1905, to June, 1910. The building is monumental and dignified, treated in the spirit of the late German Renaissance with scarcely any tincture of "neu-bau" feeling. The remainder of the illustrations show many varieties of recent buildings in Berlin and its environs, and examples of the decorative arts connected with building. A very cleverly piquant design of Messrs. E. Schutze & O. Kohtz for shops in the Kanonierstrasse, Berlin, is a welcome change from the flatness of usual street architecture.

Der Architekt (Vienna) has an article on modern English architecture illustrated by examples of the work of Mr. C. F. A. Voysey and Mr. W. H. Bidlake. The Austrian work illustrated is of an extreme Wagnerian type of "neu-bau" in the shape of designs for a theatre and for a bathing establishment.

Het Huis (Amsterdam) contains an historical and descriptive account of the house of Maarten V. Rossem (Duivelshuis) at Arnheim, in which the various changes in its appearance from the eighteenth century to its latest restoration in 1900 are illustrated. An article on Sir Alma Tadema's house also appears in our contemporary.

The Architectural Record (New York) has for its principal feature an article on English roadside cottages. Professor Adshead contributes a "Comparison of modern American Architecture with that of European Cities." The series on the architecture of American colleges now deals with Brown, Bowdoin, Trinity and Wesleyan. Other papers are "Studies of Design without Ornament," an appreciation of modern warehouse buildings in the States, and a tribute to Thomas Jefferson, the architect.

THE Local Government Board have informed the Lytham Council that they are prepared to entertain an application for a provisional order to enable the Council to acquire compulsorily land for a site and the erection of a market hall and public hall. It is desired to secure a piece of freehold land in Market Square.

FORTHCOMING EVENTS.

Saturday, February 25.
Royal Institution : Mr. T. G. Jackson, R.A., on "Architecture—The Byzantine and Romanesque Period" (third lecture).
Monday, February 27.
Royal Institute of British Architects : Business Meeting. Election of Royal Gold Medallist. Election of Members.
Royal Academy : Lectures on Architecture by Professor R. T. Blomfield, A.R.A. : (3) "The End of Gothic in France."
Victoria and Albert Museum : Mr. Banister Fletcher on "Spanish Mediæval Architecture" (University of London lectures).
Tuesday, February 28.
Nottingham Architectural Society : Mr. A. N. Bromley on "Water Colour as an Aid to Architecture."
British Museum : Mr. Banister Fletcher on "Early Christian Architecture in Rome" (University of London lectures).
Surveyors' Institution : Annual Dinner.
Wednesday, March 1.
Edinburgh Architectural Association : Mr. J. A. Williamson on "Notes on the recent International Town Planning Conference."
Carpenters' Company : Mr. Arthur Keen on "Joinery in Old London."

THE ARTISTIC DEVELOPMENT OF LONDON.

HE means by which Mr. PAUL WATERHOUSE proposes to further the artistic or architectural development of London are worthy of careful consideration. He postulates that as a first essential control of architectural design is necessary. As we view the recently-erected buildings in the Metropolis we must recognise that there is a large amount of excellent architectural design exemplified in all directions, but on the other hand we are bound to admit that there are still being placed on our streets elevations that are very far from beautiful from the evident lack on the part of their authors not only of striking artistic ability, but even of the rudimentary knowledge of the elements of good design in architecture. Happily, to-day the fairly creditable if not the comparatively excellent is far more prevalent in our metropolitan architecture than even the obviously feeble, still more the flagrantly ignorant. Hence, spite of the general high level of achievement, we must grant Mr. WATERHOUSE his postulate that some artistic sense should ever be watchfully controlling.

We agree with Mr. WATERHOUSE that no one man could successfully cope with the arduous labour of controlling the whole of London's modern architecture, and therefore if there is to be control it must be subdivided amongst many hands. Thus, the suggestion of the appointment of borough architects, each of whom should be the arbiter of artistic fitness in the district over which he presided, has apparently an element of wisdom.

But what would happen if the scheme were put into operation? A design for a certain proposed building could be submitted to the borough architect clearly, let us suppose, void of all artistic merit, even perhaps hopelessly incompetent. Is the official architect to say to the author: "Take this away and bring me something better"? even though it may be patent that the original designer is quite incapable himself of producing a building that might, on a lenient view, be passed as fairly satisfactory. The borough architect could not himself make the fresh design, because Mr. WATERHOUSE debars him from private engagements in his own district, and rightly so, for otherwise the occupancy of the post would speedily lead to a practical monopoly, in many cases, of the architectural design of a particular district.

Would Mr. WATERHOUSE allow his official to prescribe, in such a case as we are supposing, that Mr. A. or Mr. B. should be called in to assist? This solution of the problem would certainly lead to favouritism, or to what would be almost as bad, to a suspicion of favouritism. It would besides put the original architect in a position that a self-respecting professional man would be satisfied to

occupy. No architect would care to go to his client and say: "My design is so unsatisfactory that I must ask you to allow Mr. A. to be associated with me," and would not the client be justified in replying: "I do not admire Mr. A.'s designs. If you are not to be allowed to do the work I have entrusted to you, I should prefer Mr. M."?

There is another aspect of the question that demands consideration. Presumably, in Mr. WATERHOUSE's scheme the borough architect would be selected on account of his previous artistic productions. Now, it almost invariably is the case that those architects who, by their works, have shown their artistic capability, are men of marked individuality and idiosyncrasy, which could not fail to be reflected in the architecture produced under their control. Hence, in one borough we should have a wave of some particular phase or mode of current architectural predilection which would be liable to be completely altered on a change of individualism in control, and would be entirely different from that prevailing in the next-door boroughs. So that the history of the future architectural development of London would be no more than a record of the influence of the varied idiosyncrasies that happened to be in control at specific periods. We do not believe that the constitution of a board of borough architects would be sufficient to counteract this tendency.

Mr. WATERHOUSE laid down the axiom that the houses of our streets may be beautiful individually or collectively. We suspect him of a desire that there should be in London more beauty of a collective type. As we have seen, the appointment of great artists as borough architects would not tend to the fulfilment of this desire. We have in London still remaining to us some examples of eighteenth and early nineteenth century attempts at this collective beauty, but it is beyond question that such a development is wholly antagonistic to the tendency of London's architectural growth in our own times.

It is within the memory of us all that the London County Council set out with the intention of making Aldwych and Kingsway an example of modern architecture on well-regulated lines of collective beauty. But events have proved too strong for them, and these thoroughfares are in course of becoming, instead, a typical demonstration of individualism and its predominance in modern English architecture. Nor need this be altogether regretted. Our opinions may vary as to the relative merits of the designs that have been and are taking shape in this latest Metropolitan development of architecture, but in fairness we think it must be admitted that there is nothing actually bad in the specimens of modern architectural design to be there seen. For this we have no doubt in some measure to thank the control

POPPYHEAD AT ST. DAVIDS CATHEDRAL.

that has been exercised by the London County Council, and especially beyond doubt the influence of the able and catholic discernment and judgment of Mr. RILEY.

We have, therefore, in Aldwych and Kingsway a justification of Mr. WATERHOUSE's plea for the control of architectural design in London, and also an exemplification of the kind of control that is required. We do not want our arbiters of taste to be artists of limited view and strong predilections in design, but men of wide sympathies and clear, impartial judgment, so that excellence of design may be admitted in whatever phase of Classic, Renaissance, Gothic, Romanesque, or even New Art it may be clothed, and the characteristic individualism of our modern English architecture may be preserved.

NOTES AND COMMENTS.

THE fencing match between the London County Council and H.M. Office of Works is still going on, the compromise by which some sort of a road will be made for the Coronation procession to pass under the Admiralty arch and so into Whitehall being no more than an armistice, as Sir G. L. GOMME writes on behalf of the Council:—"I am to state that, after the completion of the widening of the roadway for the purpose of the Coronation, the Council cannot accept any further responsibility for an improvement which, at its inception, was considered a Government scheme for a stately entrance for Buckingham Palace and St. James's Park, and has since been carried forward without consultation with the Council, but I am to add that the Council is willing, in view of the difference of opinion that exists between H.M. Office of Works and the Council on the subject of their respective liabilities, to submit to arbitration the question of the proportions which the Council and the Government should contribute towards the completion of this improvement as a whole." To which Sir SCHOMBERG McDONNELL replies:—"With regard to the final paragraph of your letter, I am to say that the First Commissioner observes that certain questions are

involved which have not yet been under discussion. The immediate point being the preparation of the road for the Coronation, Lord BEAUCHAMP does not think that any advantage would be gained by any comment upon them at this stage."

THE King EDWARD Memorial for Scotland is not yet National, as the Corporation of Glasgow by a large majority has expressed its disapproval of the decision by the Scottish National Committee to adopt a scheme in connection with Holyrood Palace as the form of the Memorial. The attitude of the Glasgow Corporation seems to display a foolish and unreasonable jealousy that is very regrettable in such a connection. If Scotland is to have a National Memorial to King EDWARD why should all graciousness be taken out of it by a petty squabble like this? Glasgow may be an important city, and its citizens may think themselves of high importance, but Edinburgh is still the capital city of Scotland, and therefore to our thinking quite the most suitable location for a National Memorial.

THE Bishop of BIRMINGHAM in his address to the members of the Birmingham Architectural Association, gave some practical hints on church planning which are worthy of remembrance. His objection to a narrow step on the west side of the altar, however, scarcely arises from the default of the architects, who have built to suit the ritual in vogue when they were required to provide a holy table and not an altar before the eastward position had become as general as it is to-day.

DR. GORE's stricture on communion rails is true enough, and he was justified in saying:—"It appears to me incredible, but it is true, that in a great number of churches communicants are made to kneel on a lower level than the person who is to administer the cup to them. And a high rail is intruded. The result is that at the most solemn moment, when you want them to be thinking about nothing except the spiritual meaning of the act they are engaged upon, and when you yourself want to be able to perform what is an exceedingly solemn act with a totally free and disengaged mind, you are entirely occupied in trying to insert a cup in between a lofty rail—very likely with spikes of some kind—and under the rim of a large hat, and it is a tormenting process."

WE can also approve his condemnation of the "dim religious light," which was in the past a concomitant of the selection of Early English as the most suitable period on which to base modern churches, because it was the cheapest. In our most modern churches, however, the preference for a version of Perpendicular has removed the objection to which the Bishop took exception.

It is unusual to find an ecclesiastic who, like Bishop GORE, adopts the eastward position objecting to the monastic ideal which lingered on in the construction of churches, as when the choir was screened off or hedged in and advocating the ideal represented in the earliest Christian churches, when the whole congregation and not the choir, or any one part of it, was the consecrated body. He urged that it was the earlier, the congregational ideal they ought to try and build for. Looking at a modern church, one might ask, he said:—"I wonder why these boys and choir men are selected for this extraordinary seclusion. I never heard that they are particularly holy or anything of that kind." There was a good deal to be said for the choir being in the middle of the church from the point of view of their leading the congregation there was very little to be said for their being shut up behind screens in a narrow choir.

PERHAPS of all Bishop GORE's recommendations the most sound was that there should be attached to every church its architect's design for its gradual beautification or decoration, and his proposal, as a sort of a bribe, that it should be unnecessary to obtain a faculty when the decoration was in accordance with the architect's design.

POPPYHEAD AT CHESTER CATHEDRAL.

that principle were once established they would get rid of what was at present a grave disaster, namely, that every individual who wished to put up a memorial to wife or parents "goes off to an architect or designer and gets the thing drawn out; then comes with it and says, 'I want to put this up to my mother,' and considers himself aggrieved or offended in his tenderest susceptibilities unless he is allowed to put it up."

THE undeveloped wealth of the United Kingdom in beautiful building stones, particularly marble, is perhaps nowhere more remarkable than in the island of Skye, where, despite past failures, we learn from the *Sheffield Daily Telegraph*, a fresh effort is to be made to exploit its undoubted resources in this direction. After some years of prospecting work, an Edinburgh company, styled "Skye Marble, Ltd.," in conjunction with another company called "The British and Foreign Marble Company," have decided to quarry the marble in Skye on an extensive scale. The capital subscribed by the two companies runs into five figures, and elaborate preparations are being made to work the rich deposits that lie in the neighbourhood of the village of Broadford. A careful survey of the marble resources of this part of the island has encouraged the promoters to believe that Skye marble will become a formidable competitor of the Italian, Greek, and French marbles which, at present, are so largely imported into this country for decorative purposes. They look forward hopefully to a time when the monuments in our public squares will no longer be composed of Carrara marble, but of the mineral brought from the "misty isle of Skye."

It has been suggested by Mr. ALFRED T. DAVIES, Secretary of the Welsh Department of the Board of Education, that the new school which is about to be erected in the parish of Gyffin, near Conway, in Carnarvonshire, should be called "Ysgol Goffa JOHN GIBSON" (the JOHN GIBSON Memorial School). Mr. DAVIES states that Gyffin

was the birthplace of JOHN GIBSON, R.A., and that the school would serve the purpose of keeping green the memory of the great sculptor "in the village in which he first saw the light." There is, however, some difficulty about the matter, and there are valid reasons for supposing that the proposed memorial school should be situated in Denbighshire and not in Carnarvonshire. A leading Welsh authority, after making exhaustive inquiries into the matter, states that JOHN GIBSON was born in the year 1789 in the Baptist chapel-house of Fforddilas, in the parish of Llansantffraid, Glan Conway, in Denbighshire. Neither the month nor the day of his birth is known.

THE TRANSITION OF LONDON'S PLAN, ITS DISAPPEARING LANDMARKS, AND—AFTER.*

TO the occasional visitor no feature can be more striking than the kaleidoscopic changes in what may be termed the structural development of London. This never-ceasing mutation includes not only the formation of new and the widening of old thoroughfares but also the removal and re-building of some of London's most notable landmarks.

The causes may be briefly indicated as the increase in business and traffic and also the modern and healthier tendency to leave the centre and live in the suburbs, which has been so much fostered by the rapid transit, and has also been considerably affected by the operation of Acts relating to housing of the working classes. As regards further street accommodation, there has been no opportunity since the Great Fire for making an important scheme for the proper planning of London. Unfortunately, Wren's plan, which might have set so noteworthy an example, has been rendered abortive by subsequent events. Wren's plan is notable as showing his conception of the necessity for main east and west streets, with focal centres from which other streets should radiate. Each generation appears to have dealt with the question of traffic space about buildings and kindred matters in a way that sufficed only for a time. There has been no comprehensive effort to foresee the wants of the future, and to formulate a practical and rational plan. This default has led to the necessity of very heavy financial expenditure. The London County Council, up to December, 1909, effected, or was in course of carrying out, 133 improvements, estimated to cost $3\frac{1}{2}$ millions sterling, besides contributing $1\frac{1}{2}$ millions towards the cost of 486 local improvements. The Council's predecessors, the Metropolitan Board of Works, expended 10 millions in constructing new, and widening old thoroughfares, and also paid another million towards the cost of local improvements. The outlay of the City of London and the local authorities from 1856 to 1889, exclusive of contributions from the central authority, was over a million sterling, and these bodies are spending from 40,000*l.* to 50,000*l.* per annum with the same object. The City Corporation has also recently initiated works of considerable magnitude, such as the widening of Fleet Street and Bishopsgate Street, which alone are estimated to cost nearly three-quarters of a million sterling.

These improvements have considerably affected London's plan; but it is to be doubted whether the result is in any way adequate. Queen Victoria Street was completed in 1871, Northumberland Avenue in 1876, Shaftesbury Avenue in 1886, Charing Cross Road in 1887, and Rosebery Avenue in 1892; but these important and costly efforts to improve the planning of London must already be considered as almost obsolescent, and can only be regarded as touching the fringe of a great question. As an example of the costliness of the want of sufficient provision for future requirements the improvement of High Street, Kensington, may be quoted. A widening of the south side was carried out in 1866 at a net cost of 126,000*l.* This improvement, however, gave a width of only about 47 feet east of Church Street. It became rapidly apparent that a further widening would be necessary, as this thoroughfare forms the main western outlet, and as early as 1888 a scheme was put forward with this object. It was not, however, until 1899 that powers were obtained to widen on the north side at an estimated cost of 87,500*l.* It will be seen that for nearly one-third of the improvement the widenings have overlapped, and the additional expense entailed thereby might have been avoided if a sufficiently comprehensive scheme had been put forward in 1866. Even now, after an expenditure of 213,500*l.*, the average width to the east of Church Street is only 60 feet,

* Part of a lecture delivered at Carpenters' Hall, February 16, by Mr. W. E. Riley, F.R.I.B.A., superintending architect to the London County Council.

while to the west, at the part where the road was constructed in 1866, the width in one part is only 44 feet. The erection, however, of such large stores as Barker's places the greatest difficulty in the way of any further widening.

The greatest of modern improvements is undoubtedly the large scheme now effected connecting Holborn with the Strand. The subject of forming a connection such as Kingsway was under discussion as far back as 1836. In that year a House of Commons Committee favourably considered the formation of a road, being a continuation of Lincoln's Inn Fields to Newcastle Street, and the widening of Gate Street leading to Holborn. The Report also advised the removal of the houses in Holywell Street so as to widen the Strand. In the year 1847, Mr. J. Pennethorne prepared a plan showing streets from this area from east to west, with suggested spur streets to the Strand near Wellington Street, and also to Lincoln's Inn Fields. In 1878, Mr. Teulon prepared a scheme for a connecting street—the most complete up to this date. It may be of interest to note that this scheme shows an island garden in the Strand, not unlike that recently proposed when the suggested setting back of the Strand frontage was under consideration.

The London County Council considered many plans before deciding on the scheme as now carried out with a 100 feet street at an actual cost of five millions sterling and an estimated net cost of about three-quarters of a million. Previous schemes showing the new thoroughfare terminated by the church of St. Mary-le-Strand had been objected to, and the crescent-shaped Aldwych, with the "island site" between that street and the Strand, was finally decided upon. I think that not only will the broad and generous lines of the scheme be admitted, but also its sanitary effect in abolishing a squalid area. One point of importance was the question of the retention or the removal of the church of St. Mary-le-Strand. This church was designed by James Gibbs, and finished in 1723, and was the architect's first building after his return from Italy. For its position, it would be difficult to arrange a more artistic note. It is erected on a podium or pedestal, and the west portico is very pleasing. I believe it was originally intended to crown the west front by a statue of Queen Anne; but after her death the present tower was substituted. Its suggested removal aroused public opposition, as the church undoubtedly forms a highly picturesque object in all views of the Strand, and its removal would have deprived this part of London of one of its most attractive and interesting features.

An important discussion arose on the line of widening to be adopted at the eastern horn of the crescent to preserve the vista eastwards, including the Law Courts and St. Clement Danes Church, at the eastern end of Aldwych. The body of this church was designed by Wren, but the steeple was finished by his pupil, Gibbs. The most northerly line was suggested by Mr. Hamo Thornycroft, the next by the Further Strand Improvement Committee, the next by the Royal Institute of British Architects, and the most southerly line by myself.

Other expensive widenings to which allusion must be made include that of Long Lane, Southwark, at a cost of nearly 200,000*l.*; Mare Street, Hackney, 660,000*l.*; Goswell Road, 227,000*l.*; Hampstead Road, 245,000*l.*; Piccadilly, 300,000*l.*; the extension of the Thames Embankment and improvements at Millbank, 1,300,000*l.*, and there has thus been an energetic but belated effort to overtake the requirements of the present time. But the very small endeavour which has been made comparatively recently, as a result of the Royal Commission on London Traffic, which sat from 1903-05, shows how supremely difficult it is to give any practical effect to the great problem which has to be dealt with. The average width of the streets widened by the Council is only about 60 feet to 62 feet, and a map has been prepared indicating roads 60 feet and upwards in width. Perhaps the first impression which this map produces is as to the complete want of regulation or design in the lay-out of these main thoroughfares. A generally accepted theory in modern town planning is that focal centres shall be provided from which broad roads shall radiate, and which are joined by concentric streets, and those acquainted with the plans of Paris, Washington, and other cities will appreciate the advantages of this system. The map of Washington shows streets, many of which are 160 feet wide, which converge on centres such as the Capitol, affording not only the magnificence of vista, but, by means of cross streets, convenience of access. Paris is a familiar example of the same principle. It will be seen that London is chiefly remarkable for the absence of such focal centres, and as regards wide streets, it may be noticed how in many main outlets a width of even 60 feet is not sustained. Paris

has 102 miles of streets 98 feet wide or more; London has only 8½ miles in all the streets of that width. It is instructive also to observe how inadequate are the main outlets from London into the country. In many cases even a width of 60 feet is not maintained to the county boundary, and in the south-east and north-east of London such outlets can scarcely be said to exist. Paris has forty-two roads radiating into the surrounding country; London, with a population twice as large, has only twenty. The example of Paris may be cited as a complete contrast to the policy—or lack of policy—which has characterised London street improvement. As is well known, a plan of Paris improvements was drawn up so long ago as the end of the eighteenth century, and this was followed by Haussmann's courageous scheme of the middle of the last century. The policy of systematic development has been continuous in Paris irrespective of changes of Government with a result which is unique.

Even the briefest survey of alterations in London's street plan would be incomplete without a reference to the improvement of the Mall, which is part of the Queen Victoria Memorial. Sir Aston Webb's original proposal provides for a direct and unobstructed access into Charing Cross, a feature which is common to all the schemes then submitted, and it is hoped that an adequate outlet may not remain unprovided. A further important scheme for relieving congestion of traffic was the alteration at the Marble Arch, by the formation of a new road, 100 feet wide, south of the Arch, which was rendered possible by the surrender of a portion of Hyde Park. It was pointed out to the Royal Commission on Traffic that traffic at this point surpassed that at any other in London, and it is hoped that not only will the improvement have a utilitarian value, but that the Arch itself will assume the position of importance which it merits.

The transition of London has its architectural as well as its engineering side. To attain the best results, it is essential that, whilst improved traffic facilities are afforded, architectural treatment of great dignity should be secured, and in the case of the Kingsway improvement the County Council co-operated with the Royal Institute of British Architects in selecting eight architects, who were invited to submit sketches for the various frontages. However desirable, in the interests of architecture, the adoption of any of these schemes would have been, the Council has hesitated to impose upon its lessees any rigid scheme as suggested by these architects, with the result that each design submitted for new buildings is considered on its own merits. The Council has become, because of the reason of the surplus land acquired, one of the largest landowners in London, with a rent-roll of 325,000*l.* a year, and having regard to the interests of the ratepayers, it is most desirous to avoid any restrictions as to elevation, &c., which might delay letting the land. Circumstances have not been altogether propitious. I venture to think the architectural treatment which has so far resulted, as shown by the western end of Aldwych, is above the average of monumental work hitherto attained in Metropolitan improvements. Mention should be made of the Council's Central School of Arts and Crafts erected on the east side of Southampton Row.

It is difficult to believe that this area was but recently covered with evil-looking alleys and courts which gave the district an unenviable notoriety, and any account of the scheme would be incomplete without some reference to the notable landmarks which it caused to disappear. No part of London is richer in historical associations, and many ancient buildings had to be demolished in connection with the improvement. The Benchers' Hall of the New Inn, which was demolished, in Wych Street, was founded in the reign of Edward IV. as an Inn of Chancery appertaining to the Middle Temple. Wych Street contained many of the gable houses in plaster and timber, with projecting front and tiled roofs, which were typical of the old London houses existing before the Great Fire, of which few now remain in London. Drury Lane possessed a notoriety of centuries, and the lodging has now gone at which Pepys tells us he saw "pretty Nell Gwynne standing in her smock-sleeves at bodice, looking upon one. She seemed a mighty prettish creature." The Sardinia Chapel in Lincoln's Inn Fields, which also had to be demolished, was said to be one of the oldest Catholic chapels in London, and the only entrance was originally through No. 54 Lincoln's Inn Fields, the residence of the Sardinian Ambassador. The painting above the altar showing the Descent from the Cross is attributed to Cassa, and is said to have cost 2,500*l.* This has been removed to the new chapel in Kingsway. The interior of the front room of the first floor of 2 Portsmouth Street, Lincoln's Inn Fields, had an elaborate plaster ceiling, deal wall-panelling, and carved pilasters to the mantelpiece, enriched with bunches of

fruit and flowers in high relief. This building was probably erected from the designs of Inigo Jones, who planned the square, about 1618. At the south-west corner of Lincoln's Inn Fields stands the curious little building which is credited as being Dickens's original Old Curiosity Shop. This has for the time being withstood the ravages of the improvement.

A consideration which has largely affected the architectural results of street improvements has been the operation of the Housing and Improvements Acts. In many cases it is stipulated that all persons displaced who had permanent employment in the district should be rehoused within a mile of their former dwelling. In the Kingsway and Southampton Row improvements an area $3\frac{1}{2}$ acres in extent was acquired for this purpose, and with an insanitary area of $1\frac{1}{2}$ acres cleared under the Clerkenwell and Holborn Improvement Scheme, 1899, the Bourne Estate scheme has been laid out, so as to provide accommodation for 3,902 persons.

The average area of the living-rooms is 150 feet super., and that of the bedrooms 100 feet. The average cubic space in the living-room is 1,275 feet, and in the bedrooms 850 feet. The buildings were planned for the internal blocks to lie north and south, so as to obtain the maximum of sunlight in the living-rooms, and each tenement has at least one room looking on to a garden. The type of plan designed for these buildings is an improved "Balcony Plan," arranged so that the living-rooms and bedrooms do not look on to any of the balconies, and have an unobstructed light. The buildings are five storeys in height, with a few attics. Bruce House—a lodging-house at the corner of Kemble Street and Drury Lane—is another example of the fulfilment of part of the obligation to rehouse under the Holborn-to-Strand Improvement. Bruce House contains 709 cubicles, affording accommodation for 698 lodgers (men) and eleven porters. It was opened in 1906, and cost 50,020*l*. Each lodger has an independent cubicle, having a minimum width of 4 feet $10\frac{1}{2}$ inches, with an area of 36 feet super., and lighted by a separate window. The cost of land is a serious handicap to housing operations. Briefly, the financial obligations entails the necessity of building dwellings which will recoup themselves in sixty years, paying sinking fund charges and interest of cost of buildings and of the land, which is written down in value, as if it were earmarked for housing purposes. In the central districts of London it generally costs 15*s*. to 17*s*. per foot super. to clear slums; but very few schemes can be made to pay if the charge for land alone is more than about 5*s*. per foot.

The type of plan used at the Bourne Estate was also adopted for Darcy Buildings, a small five-storey block of dwellings erected for rehousing some of the persons displaced through the widening of Mare Street, Hackney. The site, though narrow, is an excellent one, as the building overlooks London Fields, a permanently-secured open space. Further examples, where the plan of London has been changed by the substitution of healthy dwellings for insanitary slums, are the Boundary Street area, Bethnal Green; Churchway, St. Pancras; Webber Row, Southwark; and Millbank, and of another type the Caledonian Estate, Islington, may be quoted. This estate is about two acres in extent, and being acquired under Part III. of the Housing Act, bears no rehousing obligation. The buildings are five-storey block dwellings, containing 272 tenements. As showing the magnitude of the housing operations and their influence on the disposition of the population, it is interesting to note that the Metropolitan Board of Works, the Council, and other authorities have carried out clearance schemes which displaced over 70,000 persons, for 67,000 of which accommodation has been provided in new dwellings. The great improvements for cross-river communication have had the same engineering and architectural effect on the plan of London. The Corporation of London have given us the Tower Bridge, and the County Council a new bridge at Vauxhall, not to mention the tunnels at Blackwall, Rotherhithe, and Greenwich. These works necessitated not only street-works of a substantial character in the shape of approaches, but involved also the beneficent removal of much slum property, and its replacement with healthier habitations. As regards Vauxhall Bridge, a distinct step forward was made when the aesthetic treatment of it was decided to be a matter for collaboration between engineer and architect. Whether pylons upon the shore piers, or some other such feature, giving emphasis to the bridge, will ever be erected is problematical; but the importance and value of the whole scheme would be materially improved if something of the kind were added. Reference should be made to the sculptors' work on the bridge, the figures in the panels reflecting the greatest

credit on Mr. A. Drury, A.R.A., and Mr. F. W. Pomeroy, A.R.A.

The architectural evolution of London is no less remarkable than the changes which have taken place in its street plan. The authorities have set an example in public buildings, such as the new Local Government Board and other public offices at the corner of Parliament Street and Great George Street, the new War and Admiralty Offices, and the Offices for the Woods and Forests, which have become more spectacular and permanent. The buildings in Great George Street which were demolished to make way for the extension of the new Government offices were of considerable architectural interest. The stone front to the park was designed by Adam, the brick front not being considered satisfactory, and it was observed during the recent demolition that the internal brick walls had little bond with the external. This front was carefully taken down by H.M. Office of Works, and the stones numbered. It is now being re-erected on the Horse Guards Parade as a new front to the Paymaster-General's Office. The general exterior of the old War Office buildings in Pall Mall, of which the east block was erected by Sir John Soane in 1790, is extremely refined and unassuming. The architectural treatment of the staircase well reveals Soane's internal treatment of the cupolettes at the Bank of England. The extreme richness of the Ionic Order, with its deep entablature, embellished with medallions containing bas-reliefs and supporting caryatides, gives great architectural distinction to the staircase. The Secretary of State's room in the internal block, designed by Brettingham, had a remarkably fine ceiling. Mr. Norman Shaw's new police-offices at New Scotland Yard is a building which is generally acknowledged to be one of the most original and skilfully designed of recent years. The deep granite base and happily-arranged fenestration, surmounted by a heavy, well-proportioned cornice, steep slated roof, and symmetrically-disposed, massive chimneys, are thoroughly expressive of the purpose for which the building was designed. This building marks an architectural improvement undoubtedly effective. The Corporation of London have removed the old Newgate Prison, which, whilst no doubt of the greatest historical and architectural interest, had probably outgrown the requirements of the age, and have in its place erected Mr. Mountford's new Court of Justice. The Old Bailey was built by George Dance, the younger, and has been described as the most imaginative building in London and an astounding architectural fluke. No one walking through the streets of London can fail to observe the drastic manner in which old buildings are giving place to those of far greater pretensions. The reconstruction of the buildings between Piccadilly and Regent Street by Mr. Norman Shaw; the demolition of Cockerell's charming example of Greek ornament and detail, at the corner of Agar Street and the Strand, which was replaced by Mr. Percy Adams's building, with the much-discussed statuary; the rebuilding of a portion of Nash's Waterloo Place shows a difference in scale, necessitated by modern requirements, between new and old. All these, and the large number of new theatres, hotels, and the rebuilding of banks and insurance offices, bear testimony to the importance of the change which is not even perturbed by any consideration of antiquity, as is seen by the demolition of Christ's Hospital in Newgate Street. It is to be hoped that the Government will see their way to retain the old premises now vacant in St. Martin's-le-Grand erected by Sir Robert Smirke, and which London can ill afford to lose.

Some reference should be made to the work instituted by the County Council of preserving a suitable record of architectural and historical buildings which are rebuilt or demolished in connection with improvement schemes. Every building is carefully surveyed. This has now been the practice for some years, with the result that a valuable collection of many hundreds of drawings and photographs has been formed, which illustrate a phase of Old London which is rapidly disappearing. Recently the remains of a ship of the Roman period have been unearthed in connection with the excavations for the new County Hall. These remains were discovered 21 feet below the road level. Of oak and carvel construction, the relic measures approximately 38 feet in length by 18 feet in width; but as the stern and a considerable portion are missing, she was probably about 60 feet in length, with a beam of about 16 feet. The joints and construction throughout indicate the vessel as a fine piece of carpentry. It is possible that the ship was constructed by Carausius, as evidenced by the coins found in the boat. The vessel is a most interesting relic of the time of the Roman occupation, and she may have formed one of the fleet belonging to Allectus, which was endeavouring to escape from the

advance of the conquering Romans under Constantius; but, suffering in the conflict, was run aground and sunk, and so left for succeeding ages to bring to light.

It has been seen how rapidly the appearance of the capital of the Empire is changing, and there is little doubt that the change will not cease. There can hardly be found a town or city in Europe which is finished, and when the wonderful examples of rapid growth which are furnished by districts surrounding the Metropolis—such as Walthamstow, East Ham, Edmonton, Acton, Ealing, Willesden, and others—are considered, it is difficult to foresee what the eventual limitations of the capital will be. Inside the county about 5,000 new buildings are being erected each year, and its fringes are in a constant state of transition. We find garden suburbs and garden cities appearing in every direction, from Hampstead to Esher, and from Ruislip to Park Langley; and municipal estates for the accommodation of the working classes are being developed at Norbury, Totterdown, and White Hart Lane, Tottenham. It is of the utmost importance, in view of this rapid extension, that definite action should be taken to obviate any repetition of the unsatisfactory results of the past. It is to be hoped that Mr. John Burns's Town Planning Act may be of service in supplementing some of the deficiencies of inadequate building laws. London has especially suffered in this direction. Hitherto its evolution and extension have been controlled to a limited extent only, the requirements as to width of streets and space about buildings being very restricted in scope, and, provided a certain minimum standard were complied with, the sanction of the Council could not be withheld, or might be set aside on appeal to the tribunal constituted under the Act. As a result, streets have been allowed in which "direct" communication is provided by streets of dog-legged shapes, and examples might be shown, such as that of two adjoining estates of 500 acres, which were deliberately laid out with the express object of preventing access from one to the other. The Building Act was powerless to prevent such a miscarriage of its intentions, involving present inconvenience and future harmfulness. In London there is nothing in the building law to prevent the erection of the interminable unbroken rows of houses whose monotony is almost as offensive as their public inconvenience. If the Town Planning Act can do anything to secure more rational and convenient development, it will have accomplished much.

It is also satisfactory to note that the labours of the Royal Commission on London Traffic have found continuity in the appointment of the London Traffic Branch of the Board of Trade, presided over by Colonel Sir Herbert Jekyll. Reference may here be made to one important thoroughfare which will possibly become of greater importance in the near future. The Royal Commission suggested that Euston and Marylebone Roads might be widened to the width of a first-class street (100 feet) without considerable expense, and it is clear that if these roads and Pentonville Road were made of that width, a very useful east and west communication, separated from the central traffic, would be established. A considerable improvement in Euston Road has already been effected as the result of negotiations between the Council and the Skinners Company, by which the Company have been granted permission to erect buildings in advance of the general line between Tonbridge Street and Mabledon Place, conditionally on surrendering part of the forecourts to the public way. The effect of this proposal will be to secure a thoroughfare approximately 100 feet wide at this part, without expense to the public.

It is, of course, of the utmost importance that traffic and business requirements in the central areas should receive consideration; but a no less pressing need is to establish the main arterial communications with districts surrounding the Metropolis. Not only can main arteries be fixed now much more economically than, say, a decade hence, and in such a manner as to regulate the development of the suburbs, but it is most undesirable that the beautiful parts of South-east London and others on the western boundary which remain uncovered should be built on in the same uninteresting and unsatisfactory manner as other districts in these localities. If the main lines of communication are laid down, there need be little fear for the development of the areas between them. Fortunately, Greater London is amply supplied with open spaces, and such excellent and popular air-spaces as Bushy Park and Hampton Court Gardens, belonging to the Crown; Epping Forest, Burnham Beeches, and Highgate Woods, which are maintained by the Corporation; and Hainault Forest and Marble Hill, which are maintained by the County Council, will, in a few years, be as essential to the life of the greater city as are now the parks and open spaces which form

such a satisfactory feature of the inner town plan. We cannot claim for London any comprehensive development on the lines of Paris; but the present appears to be a suitable opportunity for considering whether its expansion should not be regulated on lines which make as surely for intellectual progress as they do for the purely physical.

A MODELLING DEMONSTRATION AT CARPENTERS' HALL.

(Official Report.)

THE customary Wednesday lecture at Carpenters' Hall was pleasantly varied last week, when Mr. Alfred Drury, A.R.A., gave a demonstration of modelling a bust from life. Of the popularity of this departure there could be no doubt, if one may judge from the size of the audience (which exceeded the hall's capacious seating accommodation), the interest with which the process was watched throughout, and the cordial applause given to the artist at the end. This is not to be wondered at, since a proportion at least of those who regularly attend the valuable lectures arranged by the Carpenters' Company are craftsmen of one sort or another. This class of audience gets weary of the conventional dissertation, and is glad of a change, even though the aid of the magic lantern be summoned to present concrete objects as a reinforcement to abstract theories or historical data. There must always be a greater fascination in watching men "who do things," than listening to those "who say things." In Mr. Drury the Company had selected an artist with a high record of achievement and whose work is to be seen in many different parts of this country. Indeed, more than most sculptors, Mr. Drury has played a part in the artistic development of our towns, having had an unusual number of commissions for architectural sculpture.

It was not, however, in that particular form that the artist chose to show his powers last week. The task he set himself was a difficult one, for in full view of a crowded hall he made a portrait bust of an unfamiliar male model in about sixty or seventy minutes. The unfavourableness of the conditions was increased by the fact that the strong electric light over the platform destroyed the proper facial light and shade. In spite of all these handicaps, Mr. Drury succeeded in building up a most striking portrait-bust on to a roughly shaped piece of clay. It was, as he remarked at the end of the demonstration, to be considered as simply a preparation for a head. The aim had been to catch the character of the model in as short a time as possible. When this was once accomplished a sculptor had only to go on with the detail without sacrificing any of that character in order to arrive at a complete production. In this instance the success of Mr. Drury was unmistakable. The accompanying illustrations show the bust at the point where Mr. Drury ceased work. It may be somewhat difficult for our readers to appreciate it as an impressionist portrait without means of comparing it with the original; and any photograph of the model would be misleading unless taken at the same time, and under the same light conditions as the bust was produced. Regarded merely as lightning modelling from life, it still remains a *tour-de-force* of concentration. Its production was a revelation to many present who had never before observed the almost uncanny dexterity of a sculptor's fingers. In the short time at his disposal Mr. Drury could allow no margin for mistakes, so that the application of every additional piece of clay had to be made with unerring accuracy. His complete success was only attained at the last touch; up till then the bust had been growing by infinite degrees more and more like the model, though not until Mr. Drury said he had done all he cared to do could it have been considered as a satisfactory portrait. But the sculptor appeared to aim, he certainly achieved, something more than an impressionist likeness. The bust, without being in any sense an idealistic representation, was endowed with a vitality and character which marked it out as the work of an artist.

The sculptor's mode of procedure is as follows:—On the piece of lead pipe which supports the head the clay is built on in a small round mass, and is left to get more or less hard so as to form a foundation upon which the head is built. The first thing done is to analyse the character of the sitter, and then to start with the profile, making it as exact as possible. Next comes the general construction. When that is done and the character of the head is obtained it is only a question of entering into the subtle qualities of the delicate plane—all the time still preserving the spontaneity and character.

MODELLED BY MR. ALFRED DRURY, A.R.A., AT CARPENTERS' HALL, FEBRUARY 15.

ROYAL ACADEMY LECTURES ON ARCHITECTURE.

IN this year's course of lectures at the Royal Academy Mr. Reginald Blomfield, A.R.A., continues his detailed studies into the historical development of the French Renaissance. Eventually, we understand, the whole series will appear in a collected form. The four lectures for 1911 are titled (1) "The Du Cerceau"; (2) "French Architecture in the Sixteenth Century"; (3) "The End of Gothic in France"; and (4) "Henri IV." The opening lecture was delivered on Monday last, and dealt with "The Du Cerceau family."

The development of French art was rudely suspended in the last quarter of the sixteenth century. The old generation of artists like Goujon, De l'Orme, Primaticcio, and Lescot had gone, and there was neither money nor opportunity for the exercise of the arts. The interference of Catherine de Medici was also partly to blame, for in her large building schemes she tied down her artists to her own paltry fancies. That any traditions at all survived the chaos was largely attributable to the existence of the powerful Guilds which rendered the practice of the arts a family matter and perpetuated family traditions. For example, the most famous architect of the sixteenth century, Du Cerceau, belonged to the sixteenth century, but there seems to have been a Du Cerceau still at work in the eighteenth

century designing arabesques and the like in the almost forgotten manner of his ancestor.

The founder of this family was Jacques Androuet, who took his further name of Du Cerceau from the sign of the hoop under which he worked at Orleans. He was probably born between 1510 and 1515. Du Cerceau is supposed to have visited Italy and to have returned to Montargis about 1534. French antiquaries contend that he designed the choir of the church at Montargis. Here the only trace of the new manner is on the exterior in the sections of the cornices and the engaged columns and pilasters of the buttresses, though no attempt was made to make the various details work out correctly. All that is really good in the choir is the very interesting late Gothic interior, which does not show the slightest trace of the Renaissance.

There can be no doubt Du Cerceau's time was fully taken up with his innumerable drawings and engravings, and that he made them the business of his life. His first known work was a book of Triumphal Arches, issued at the sign of the Hoop at Orleans, in 1549. In 1550 there followed his books on Temples, "Grotesques" and "Fragments from the Antique." His first "Book of Architecture" was published in Paris in 1559. Soon afterwards he appears to have been ruined by the seizure of his property in the religious strife and to have fled for refuge to Renée of France at Montargis. He next set about his task of illustrating all the great

houses of France. Only the two parts dealing with the Royal Palaces and the most important private houses were completed. The labour of measuring these buildings and drawing them on vellum with that exquisitely delicate line of his, of engraving them on copper and arranging for their publication must have taxed his resources to the uttermost. His industry and fertility of production were immense. Du Cerceau nowhere refers in any of his descriptions to having designed any of the buildings illustrated. Such determined modesty is incompatible with De Geymüller's claim that he also practised as an architect and carried out great works like Charleval for Charles IX. and Verneuil. But his work as a draughtsman and engraver is incontestable and amazing; if he did not succeed in educating his contemporaries in Italian architecture, he had a great, and indeed unfortunate, influence on French designers in nearly all the arts. His published plates of ornaments and furniture have ever since been taken as the typical standard of the art of the French Renaissance.

Considered as archæology, always excepting his drawings of contemporary buildings, Du Cerceau's work has little accuracy or value; for he allowed himself all sorts of licence in what he offered to a public quite uneducated in neo-Classicism. The same criticism applies to his work as a designer, which seems to have no limit or control beyond the sweep of the draughtsman's pencil. The architectural sense is conspicuously absent, and the art is only a reflection of the Italian Renaissance, dimly transmitted through Giulio Romano and Primaticcio. The most elaborate and unreasonable features of French furniture and decoration of the latter part of the sixteenth century are probably due largely to these engraved designs.

The real greatness of Du Cerceau is to be found in his work as a draughtsman and as an engraver. Perhaps there has never been a finer architectural draughtsman, in regard to strict scientific accuracy of presentation and exquisite command of line for that limited purpose. When he set himself to depict the principal buildings of his time in France he made full detail surveys of the buildings on the spot and set them out with vigorous and unsparing accuracy. He revolutionised the contemporary methods of architectural drawing.

Of Du Cerceau's family as little is known as of Du Cerceau himself. Two of his four sons were architects. Baptiste, the eldest, is first heard of in the list of payments of the pensionnaires of Henry III., in which he is described as "architecte à Charleval." The only other known work of his besides this royal palace was the Pont Neuf at Paris, begun in 1578 and not completed at the time of his death in 1590. The prodigious design of Verneuil near Senlis was probably the work of Jehan de Brosse, who married Du Cerceau's sister.

Architecture was at the time still liable to chronic relapses, and so far all that one can look for is evidence of a slowly dawning sense of design, often obscured and retarded by imperfect powers of expression. The Du Cerceau family are typical of this stage, both in their accomplishment and in their failures, in their facility of ornament and in their amateur conception of architectural design. French neo-Classicism had to wait for Francois Mansart before it emerged in full maturity.

GLASGOW INSTITUTE OF ARCHITECTS.

A QUARTERLY general meeting of the Glasgow Institute of Architects was held on the 15th inst. in the secretary's chambers, 115 St. Vincent Street—Mr. John B. Wilson, F.R.I.B.A., president, in the chair. Reference was made to the death of Mr. Alexander Cullen, who had been a member of the Institute since 1897, and of Mr. D. P. Low, who, though not a member of the Institute, belonged to the old Glasgow Architectural Association. The president also referred to the loss which the profession had sustained in the death of Colonel Eustace Balfour. Mr. C. J. Maclean, the secretary, submitted a report on the matters dealt with by the council since the last meeting. The R.I.B.A. Council had agreed that members of allied societies who are eligible as licentiates should be admitted as candidates for election by the Royal Institute Council if they are nominated by the council of their society, such members to be exempt from submitting drawings or other testimonies provided they are certified by their own council as eligible and fit and proper persons to be admitted. It had been decided to support a scheme prepared by the Worshipful Company of Plumbers with reference to standardisation of plumbers' work, which provides for the use of a special trade mark, approved of by

the Board of Trade, by registered plumbers. The council noted with satisfaction the success of two Glasgow students in the R.I.B.A. prize competition—viz., Mr. Herbert I. Honeyman in winning the essay medal and Mr. A. C. Henderson in winning the Arthur Cates competition. The Royal Institute have arranged to send a selection of the prize drawings, which would be exhibited in their rooms at 1 St. Vincent Street, Glasgow, in April next.

The proposed Scottish National Memorial to King Edward VII. came up for consideration. It was unanimously agreed to while expressing sympathy with the proposal for the erection of consumptive sanatoria, something of a monumental nature was more in keeping with the object. The meeting unanimously favoured the restoration of Linlithgow Palace in preference to any other of the proposed schemes.

OUR CONTEMPORARIES FROM OVERSEAS.

THE *American Architect* (New York) illustrates fully the Ritz-Carlton Hotel, New York, of which Messrs. Warr & Wetmore are the architects; and some recently constructed "fireproof" houses by Mr. James Purdon, together with specimens of student work for the Society of Beaux-Arts Architects.

La Construction Moderne (Paris) shows how Mons. Stouffer has added to a mediæval house at Verneuil-sur-Avre, Normandy, without too far departing from the spirit of the old work. We are also given photographs of a model palace of working men's tenements which was exhibited at the Brussels Exposition last year.

Moderne Bauformen (Stuttgart) gives us a collection of examples of the work of modern Swiss architects, showing how thoroughly the "neu-bau" movement has spread into how many of the German cantons. Much, however, of the traditional picturesqueness of Swiss roof treatment and skyline is maintained.

The *Western Architect* (Minneapolis) illustrates a school building at St. Louis, an apartment house at Kansas City, a warehouse at Des Moines, Iowa; and from California, a residence at Los Angeles, a bank at San Francisco, a bungalow and the First Church of Christ Scientist at Pasadena, and residences at Detroit and Minneapolis and an office building at Allentown, Pennsylvania. Illustrated articles are included on the preliminary plans of the Minneapolis Civic Commission, and the possibility of Factory Site Improvement.

ILLUSTRATIONS.

DESIGNS SUBMITTED FOR THE SOANE MEDALLION, 1911.

THE whole of our plates this week are illustrations of the unsuccessful designs submitted in the annual student competitions of the Royal Institute of British Architects for the Soane Medallion, which, although they have not obtained reward, seem to us to be worthy of recognition.

MR. W. ROSS YOUNG, burgh surveyor, North Berwick is preparing plans for a convalescent home to be erected at North Berwick out of funds provided by the Edington bequest of 10,000*l.* and the residue of the estate.

THE Hull Corporation Property Committee had under consideration on the 15th inst. the proposal to pull down the Hull Town Hall in Lowgate and rebuild it in harmony with the new extension, now approaching completion. The scheme is estimated to cost from 20,000*l.* to 25,000*l.*, and it is advocated that, in the event of the old building being retained, about 6,000*l.* would have to be spent upon it in repairs. After discussion, it was resolved to defer any decision for a fortnight.

THE Court of Common Council have adopted a report recommending the enlargement and rebuilding of Gresham College, at the corner of Basinghall Street and Gresham Street, E.C. Options have been procured for acquiring the adjoining site of 1,220 square feet for 20,800*l.* Rough plans have been prepared showing that the united site will admit of buildings being erected thereon to accommodate from 420 to 500 people at an additional maximum cost of 15,000*l.* Half of the cost will, it is proposed, be borne by the Mercers' Company. Gresham College, which for structural reasons has not been used for some months, was erected in 1843 from the designs of Mr. G. Smith.

THE ARCHITECTURAL ASSOCIATION.

A COMBINED ordinary general meeting of the Architectural Association with the Camera Sketch and Debate Club was held on Monday last, the 20th inst., at Tufton Street, S.W., when the chair was taken by Mr. Arthur Keen, president. The following new members were elected:—Messrs. W. H. Lamb, Shepherd's Bush, W.; D. L. Meikleham, New Southgate, N.; W. G. Parkin, Bloomsbury Square, W.C.; and E. P. Trench, Richmond. The reinstatement was announced of Mr. C. E. Simmons.

A combined meeting of the Camera, Sketch and Debate Club with the Junior Art Workers' Guild was announced to take place on March 9. The subject to be announced. The third spring visit will be on March 4, at two o'clock, to the Recruiting Station and Stables, Whitehall, by kind permission of H. M. Office of Works.

Mr. W. G. NEWTON then read the following introductory paper, entitled

Brick is Eminently Suitable for Large Town Buildings.

You will appreciate, Sir, the diffidence with which I address a meeting like this on the subject of brickwork. Your practice is, as your list of sessional papers shows, to ask experts to open discussions on those subjects with which they are particularly intimate, whether it be Professor Lethaby on Greek building, Mr. Gerald Horsley on draughtsmanship, or Mr. Gill on the architect as an artistic failure. Now, Sir, the most affectionate partisan would not accuse me of knowing anything at first hand about brickwork or about large town buildings. I can only hope that I shall be able, in a general survey of the subject, to suggest lines of thought and points for discussion to those whose experience is greater.

Nor am I altogether sure that I understand the title of this paper. When we remember that brick has been the substantial material of so many London buildings—from St. Paul's to the latest stone-fronted shop in Kingsway—are we to consider that the purpose of this paper is to reaffirm the building principles of the last 300 years, as opposed either to a revival of small-stoned Gothic architecture or to the use of ferro-concrete? I think that you would consider it a quibble were I to interpret my title in that way.

I shall take it that the subject we are discussing to-night is the subject of the use of brick as the "unit of construction" in large town buildings. And we shall find that this subject has two aspects:—

1. The properties of the brick as affecting the design. Its colour, texture, and shape. This is the brick considered actively. 2. The properties of the brick in itself. What John Locke would have called its primary qualities. Its power of resistance to attack. This is the brick in the passive voice.

This second aspect is concerned with the body of the building, the first with its soul.

But I feel that we shall be rash in attacking so grave a subject *à priori*, as it were; one saying, "I like bricks," and another, "My dear fellow, what a degraded taste!" No; "each man of us has all the centuries in him." We cannot, until we have attained the post-impressionist position in architecture, sit down and "plant our cities all about" with Robert Louis Stevenson, where

"Great is the palace with pillar and wall,
A sort of tower on the top of it all,
And steps coming down in an orderly way
To where my toy vessels lit safe in the bay,"

and pretend that there never was any day before yesterday. I think it will not be a waste of time if we take an historical survey of the subject and gather ideas of what has been done in other lands and other times.

It is, I believe, customary to begin such an historical survey with the Tower of Babel. It is at least evident from historians and travellers that the great Central Asiatic civilisations built with brick. Herodotus's account of the building of Babylon, with its kiln-burnt bricks, can be verified to-day. Nor were they used only for the great walls, with their houses and carriageway along the top. The Palace of the Kings also, which remains even to this day as a square of 700 yards in length and breadth, is a great "pile of brickwork, chiefly of the finest kind." No less do modern travellers find half sunk in the drifting sand on the Afghan frontiers of Persia the brick walls and domes and tombs of cities of a thousand years ago. The bricks at Zaidan are partly sun-dried and partly kiln-burnt. Probably they were all covered originally with mud or stucco; perhaps painted in bright colours, like the seven walls of Ecbatana.

With Nineveh and Babylon we are accustomed to associate bricks. But they were perhaps hardly less common in Egypt.

"The use of crude brick" (I quote from Canon Rawlinson, "Notes to Herodotus") "was general in Egypt for dwelling-houses, tombs, and ordinary buildings, the walls of towns, fortresses, and the sacred enclosures of temples. Even some small ancient temples were of crude bricks." And Herodotus tells us that King Asychis, "desirous of eclipsing all his predecessors on the throne, left as a monument of his reign a pyramid of brick. It bears an inscription cut in stone, which runs thus:—'Despise me not in comparison with the stone pyramids; for I surpass them all as much as Zeus surpasses the other gods.'" It was built of bricks made from lake mud.

Athens after the battle of Salamis was largely built of sun-dried bricks, as we may infer from the fact that Themistocles's hurriedly-built city walls were of this material (except the lowest 4 feet), and that for these walls, as Thucydides tells us, private houses and public buildings were recklessly demolished. But the Greeks seem to have been in the habit of covering their brick walls with a fine, hard stucco made of marble dust. So fine and good was this that, Vitruvius tells us, the Romans of his day would use slabs of it, cut from old Greek walls, as tops for tables or sideboards.

It is the hackneyed boast of Augustus that he found Rome brick and left it marble. It must be remembered in this connection that the Roman brick which is the admiration of the archaeologist was a product of the Empire, and the only brick familiar to Vitruvius would seem to have been the sun-dried brick. M. Choisy, in his new and excellent edition of "Vitruvius," says:—"In Vitruvius's time the brick hardened in the fire is practically unused." Vitruvius describes three kinds of brick as generally used in his day. Two kinds are square. They are Greek, and are respectively four and five palms in length. The smaller were used for private buildings, the larger for public. The third kind is the Roman brick, and oblong. For an unexplained reason it is called the "Lydian."

But, after all, Vitruvius was dead before Roman architecture began—the architecture of brick and concrete which the legions were to carry with them to the Euphrates, the Rhine, the Forth. And the Roman brick, which Vitruvius had hardly seen, is familiar to the least erudite country parson.

How far the art of brick-making died with the Roman Empire, at least in the most barbarous regions of Europe, such as our own country, is a question which well deserves consideration. It was for long the accepted theory that no buildings were built of brick from the time of the Roman occupation until the reign of Henry VI. This position is adopted almost as a postulate by the eighteenth century writers in the earlier volumes of "Archæologia," and Grose in his "Antiquities" writes thus of Hurstmonceux Castle:—"This castle is built entirely with brick; and it is one of the oldest edifices of that material in this kingdom since its disuse after the Romans left the island."

Doubtless there is much in favour of this theory. The Saxon settler, as is pointed out by Mr. Hudson Turner, probably added very little to the buildings of the country. There is on record the express statement of the inhabitants of London that down to the reign of Stephen their houses were built of wood and thatch. There is no documentary evidence of brick building of an early date. And there is not to be found in England a building earlier than the last half of the thirteenth century of which the material is a brick which can be definitely pronounced to be other than Roman.

So far, then, we have seen that there was no very strong reason why the Saxons or Normans should have made bricks, that there is no evidence of existing remains to show that they did make them, and that there is evidence that they were driven to use Roman bricks.

At the same time there are many strong reasons for qualifying this position. In the first place, it is *à priori* improbable, as is pointed out by Mr. Hussey in "The Glossary of Architecture," that so simple and useful an art should ever have been lost. The necessity of providing tiles would surely have preserved the art of making them, and bricks are not more difficult. Moreover, it seems indisputable that tiles were manufactured in the twelfth and thirteenth centuries. In the year 1289 the Constable of the Tower of London made a yearly profit of some 7l. by selling the clay taken out of the enlarged moat to certain tilers in Smithfield. The name "Wat Tyler," again, seems to indicate the persistence of the calling. And as early as the year 1189 a series of disastrous fires had roused the citizens of London to seek for some method of protecting their mud walls and thatch, and one of their expedients was a close-set covering of tiles.

And if there are few evidences of early brick building in England, some parts of North Europe are rich in them. Mr. Chantrell in the R.I.B.A. Transactions for 1855 reviews

the brick fortifications, church, and town hall of Damme, in West Flanders, of which the first are at least as old as 1380. Even older are the brick churches of Pomerania—churches of great size, many of which are wholly of brick and have brick-vaulted roofs and immense brick mullions. These go back as early as 1311. And on the Baltic coast (where the great confederacy of the Hanseatic cities was developing the commerce and laying the foundations of the prosperity of North Europe) we find the mention of brick as the ordinary building material as early as 1209, when a Building Act was passed after a great fire at Lübeck to ensure that at least the two gable-ends of the houses should be of brick. And these bricks must have been of contemporary manufacture. Roman civilisation never established itself on the Elbe.

It seems, then, reasonable to suggest that the practice of brick-making in England, once initiated by the Roman settlers, never died, though in the course of centuries the type degenerated. The bold frankness of the brickwork in St. Alban's Abbey tower seems to suggest the work of men not unfamiliar with brick, though the materials they used were the Roman bricks of Verulamium. By the end of the fourteenth century, at all events, there can be little doubt that brick was extensively used. In 1382 Michael de la Pole built a great brick house at Kingston-on-Hull and enclosed the town in a brick wall, of which material most of its houses were already built. And we have preserved the building accounts of the North Bar at Beverley, which give a number of names of brick-makers. The date is 1410.

These are town buildings. Now, with the growth of a strong central Government, man dares to leave walled towns and live alone, and the next two centuries turn castles into homes and see the rise of something which the world had never seen before, the English manor-house. It is a period of the greatest significance to the student of brick architecture, a time of the building of East Barsham and Layer Marney, Sutton Place and Bramshill, a time when our country-side was endowed with that grace of stately playfulness which is so peculiarly its charm. But they are irrelevant to our present purpose—the discussion of town building.

And yet the spirit which informs the manor-house informs no less the Inns of Court, of whose

"Bricky towers,

The which on Thames broad aged back doth ride,"

Edmund Spenser writes. And I think it will not be unprofitable to spend a moment analysing the temper of this great brick century, the sixteenth; for so long as we are consciously artificial designers we are using forms of expression that have already been used in the past, as a musician might use an old theme; and it is surely important that we should not use such old themes uncritically.

It is interesting to speculate what would have been the effect on English architecture had she remained officially a Roman Catholic country. The outcome of the divorce of Catherine was to limit in a large degree the intercourse of England with Europe. Italy, Spain, and the southern nations are kept more at a distance, and England turns gradually to the north-west of Europe and the self-emancipating Netherlands. And the architectural importance of this is great. In the first quarter of the sixteenth century the builder, catching the new manner, seems, with his cupulas and "glistening gold," to be building a palace for some Venetian merchant prince or Eastern monarch.

Nonesuch and even Hengrave are almost Oriental. And Venice, if she was the front-door of Europe, was also the threshold of the East. But out of that strange welter of old traditions, of which a single corner of Hengrave, with its Eastern cupola, its Flemish bricks, its mediæval rain-water spout, and its twisted chimneys, is so apt a summary, the English building instinct emerged, and, helped by political forces to shake itself free of that Eastern lavishness, which was least its natural expression, strengthened and solidified upon essentially English lines, and found itself able to deal in its own way with the more spacious ideas and the almost new building material, which were its heritage from the cosmopolitan of the Tudor period.

The English building instinct passed thus into the same serenity of Wren and the eighteenth century.

There is another point of interest in a consideration of design in brickwork from an historical point of view, and that is the question of concealed brickwork. It would, indeed, almost seem that it was only in the seventeenth century that it began to be considered normal to rely on the texture and colour of the material and to build in bare brick. I doubt if it is generally realised how far mediæval buildings were covered with plaster or whitewash. But that such treatment was not abnormal for a building like Old St. Paul's is evident from Wren's report to the King on the suggested repairs

of the cathedral before the Great Fire. "Some," he writes, "may fall so low as to think of piecing up the old Fabrick here with Stone, there with Brick, and Cover all Faults with a Coat of Plaster, leaving it still to Posterity as a further Object of Charity"—where he is evidently deprecating the patchy nature of the work, and not the use of a coat of plaster in itself. A fortnight ago we heard Professor Lethaby, whose mediæval researches are as profound as his Greek, shuddering at the bareness of uncovered brick and stone. I think that there is little doubt that Hengrave and East Barsham Manor (to take two examples) were covered with whitewash or plaster, and possibly enlivened with gold and colour. Many names of places, such as Whitechapel, add force to the suggestion. And that it was the Greek and Roman manner there is not the least doubt: we have already seen the Roman using Greek stucco slabs for his dining-room table.

Now that we have taken a general survey of the methods and of the ideals of those who have built with bricks in the past (if I may call so hasty and imperfect a summary a general survey), I think we are in a better position to consider the future. If we know what has been done we shall attack with more confidence what is to be done.

(To be concluded.)

NOTTINGHAM ARCHITECTURAL SOCIETY.

THE fourth meeting of the Designing Club in connection with the above Society was held on Tuesday evening, February 14. There was a large attendance, Mr. Robert Evans, junr., the president, being chairman. The subject set was "Designs of Ecclesiastical Work," which were criticised by Mr. W. R. Gleave, A.R.I.B.A.

In order to save students the trouble of preparing special drawings for this subject, Mr. Gleave had asked the competitors to send in sketches and drawings from their own portfolios. Messrs. E. H. Heazell, Whittaker, Dickman, E. R. Sutton, and H. Gill also discussed the good points and otherwise of the drawings submitted, which Mr. Gleave had placed in the following order:—Mitre, first; Maltese Cross, second; Busy Bee, third; and The Dean, fourth.

On the proposition of the President, hearty votes of thanks were accorded to Mr. Gleave and to those students who had been courageous enough to submit their efforts to such fierce criticism.

Mr. Gleave, in reply, said that while the criticisms were sometimes severe, they were never intended to be unkind, and he hoped that a severe criticism would spur the competitor to better efforts next time and not discourage him or others in any way.

At the next meeting of the Society on February 28, Mr. Bromley, F.R.I.B.A., will read a paper on "Water Colour as an Aid to Architecture" and will exhibit some of his own work.

THE ILLUMINATING ENGINEERING SOCIETY.

THE LIGHTING OF LIBRARIES.

(Continued from last week.)

MR. A. E. TWENTYMAN (Board of Education) said that the reason for the unsatisfactory lighting of the library at the Board of Education was the uncertainty as to which rooms should be used for the purpose. Three separate locations had been selected and rejected because the rooms were required for other official purposes. As a matter of fact, the architect had designed a chandelier which was to be placed in all rooms used for public purposes, and the library being one of these, these chandeliers were placed down the centre of the room without any consultation with those responsible for keeping the library. The whole matter had been taken out of their hands by the Office of Works.

Mr. W. R. PRIDEAUX (Reform Club Library) said the main library at the Reform Club was one long room, for the general lighting of which there were three clusters—one in the centre of the room and one towards the two ends. This served for the general lighting and also for the lighting of those who sit around the fireplaces, which are near the clusters. In addition, there were tables all down the room, and upon these there are the usual standard lamps. Some of these are fitted with green shades, so that they did not interfere very much with the readers' eyes. He was not quite satisfied with the lighting of his own desk, and thought the

height of the standard was not quite correct, or perhaps the shape of the shade was not accurate. The bookshelves were lighted from the clusters in the ceiling.

Mr. R. W. CHAMBERS (University College Library) said the general library, in this case, was lighted by means of standard lamps on the tables and clusters running down either side of the room for general lighting. He raised the question of whether it would not be better to carry out general lighting by concealed lamps running round the cornice of the room. In his case the room was a white barrel roof, and with reflected light from concealed lamps running along the cornice he thought the general illumination would be much more satisfactory. At present the clusters in his library were not quite satisfactory, although the table lamps were, which, by the way, would be retained with the system of reflected lighting which he had mentioned.

Mr. C. D. DAVIES (Wandsworth Public Libraries) said he had been disappointed that there had been no comparisons made between the cost of gas and electricity. He had had some little trouble in this connection, and decided to use gas at his West Hill Library. The librarian's task was to adapt the places that were given him as well as he could, although committees usually listened to the architects and engineers rather than the librarians. In one case certain lighting which had been recommended by an outside gentleman was a complete failure, and he had been allowed a few shillings to alter the lights, in order to try and make the lighting a little more satisfactory. In another place the lending library had been lighted with all the lights on one switch, with the result that when the librarian wished to have light at his desk he had to light up the whole of the room.

Mr. W. WHITTAKER (Croydon Libraries Committee) said it used not to be the custom for the librarian to be consulted, but now he seemed to be getting more aggressive, and quite rightly so. At the same time the librarian and the illuminating engineer looked at the matter from different points of view, with the result that there was controversy. But he ventured to say that never in this world would the librarian, or the architect, or the illuminating engineer, or all three fused into one, ever succeed in satisfying every reader and every nature. Comparatively little had been said about reflected lighting. That form of lighting was very effective in illuminating the specimens at the museum in Jermyn Street. It might be expensive, but that, in his opinion, was a secondary matter. All lighting systems would be a great deal cheaper in the future. At the same time reflected lighting would not do in all rooms. For instance, the room of the Society of Arts, with its decorated ceiling and walls. Similarly at Croydon, where there was a very fine reference library. It was originally built as a hall, and had been gradually appropriated by the Libraries Committee. In such cases they must take the rooms as they exist and light them in an appropriate way. This showed how different various places were, and he was pleased that no dogmatic statements had been made in the discussion. It was necessary that they should proceed in the true scientific method, viz., by experiment, as only in that way would they get at perfection.

Mr. L. INKSTER (Battersea Public Libraries), in answer to Mr. Davies on the question of gas *versus* electricity, said that ten years ago he gave up gas and never regretted doing so. At the same time they were still experimenting with electricity, and did not think they had got things perfect yet; but they were trying to adapt the light to the varying conditions of their rooms, and believed they would succeed in the course of time.

Mr. PACEY (Westminster Public Libraries) said the question seemed to resolve itself into one of advice from the expert. It was very difficult for the librarian to come to a conclusion, but he would suggest that he should not rely upon the architect, nor the library committee. He should insist upon the illuminating engineer being consulted and having a free hand. Librarians and those responsible for other public institutions should not be laid under the advice of committees or even engineers in other branches of the profession. He would go further, and say that even if a corporation possessed an electrical engineer, he was not necessarily the best person to advise as to the lighting of buildings, because his function was to sell current. One other point was that, in order to get efficient results, it would be necessary for librarians to have the money to keep their walls and ceilings as bright as possible.

THE PRESIDENT, in announcing that the discussion would be adjourned for a fortnight, referred to the suggestion of Mr. Davies that comparisons between gas and electricity should be instituted. Any such comparisons he would most certainly object to, as the function of the Society was to

consider the scientific application of illumination, quite apart from the source of the light. Mr. Whittaker had suggested that they should go back to experiment; but the fact was that they had experimented and did not need to be always doing it. From past experience certain generalisations could be drawn, and the information applied in a practical way. For instance, from the discussion that evening it had come out that for table illumination they must have a minimum of 4 to 5 foot-candles, and for shelf lighting, in order to read the titles of books, there must be a minimum of $1\frac{1}{2}$ foot-candles. If they could specify such things, then they had gone a long way, because the contractor could be compelled to carry out the terms of the specification, in the same way that the terms of an ordinary engineering specification were enforced. They had been told of differences in illumination on different parts of a newspaper. Would they think of accepting a boiler, for instance, which would stand 100 lbs. pressure in one part and only 80 lbs. in another?

A meeting of the Illuminating Engineering Society was held on Tuesday, January 31, at the Royal Society of Arts, to continue the discussion on "Library Lighting" which was commenced, in conjunction with the Library Association, at the meeting on January 16. The President, Professor Silvanus P. Thompson, F.R.S., was again in the Chair.

The Hon. Secretary having read the minutes of the last meeting, proceeded to announce the names of those proposed for membership and also announced that the names of the candidates for membership read at the previous meeting had been accepted by the Council.

The PRESIDENT said that before resuming the discussion on "Library Lighting" he would ask the Hon. Secretary to read a communication from Mr. P. Blagg, dealing with the matter. Mr. Blagg pointed out that general lighting could only be economically used in reading rooms which were always full, and indirect lighting in such cases was useful. He approved of local lighting which was then only necessary to light the lamps which particular readers wanted. Therefore, local switching under the control of the public was desirable. He disagreed with the suggestion made by Mr. Darch that arc lamps should be used for general lighting; the light was not sufficiently steady. Many of the defects in lighting arose from the difficulties experienced by the contractor in getting information as to the future arrangement of the furniture; in many cases by the time this was settled the walls would be plastered and the floor laid so that he had to cut the building about considerably. Table standards made a sound job, but were open to the objection that they fixed the position of the furniture rigidly. For this reason, a combination of the rigid and the flexible, as described by Mr. Darch in connection with the Cripplegate Institute, had distinct advantages.

The PRESIDENT said he had the names of a number of gentlemen who proposed to take part in the discussion, but he did not see Mr. Waldram present. He was an architect who could give some information about the daylight lighting of libraries. He would therefore call on Mr. Wray, of the Fulham Public Libraries.

Mr. W. F. C. WRAY said that from the illustrations that had been put upon the screen the Fulham Libraries came out rather well as compared with some of the other libraries in London, and it was his intention to call the attention of his Committee to this fact. Mr. Darch had given an illustration to show what, in his opinion, would be ideal lighting for a newspaper rack, this representing what actually existed at present, he believed, at Cripplegate. This diagram, however, did not contain the figure of a reader at the stand. From the position of the lamp he thought the average height reader would have done considerable damage to the lamp and the rather fragile metal filament lamp would be liable to be broken. This raised a point in connexion with the desire to obtain ideal lighting, viz. that none of the experts seemed to make any allowance whatever between the stacks of books for three, four or more persons examining the books at the same time. He did not think that Mr. Jast's suggestion to light bookshelves from below, the light being switched on by the reader standing on a bar or rod, was a practical one, but he certainly thought that some system could be introduced whereby linolite could be made to throw light upon the individual bookshelves. This was a problem which so far as he knew, librarians had not been able to overcome, and it was one which lighting experts ought to face as soon as possible. Mr. Hare, the architect of the Fulham library, and also those at Islington, Hammersmith and elsewhere, had given the question of lighting every consideration and he was satisfied, to a certain extent, that the lighting at these places was very good. According to figures that had been compiled there were 2 foot candles at the bottom of the bookshelves at

Islington compared with only 0.4 foot-candles at Fulham, but to compare this properly, he thought that they should also consider the actual cost of the lighting. The gangways at Fulham had four 16 candle-power lamps but the gangways at Islington had seven clusters of three 16 candle-power lamps in each gangway. Thus the cost at Islington of lighting each gangway must be considerably more than at Fulham, and he questioned whether the extra expense was justified for the improvement at the bottom of the shelves.

Mr. HAYDN T. HARRISON said that although he had never had an actual opportunity of carrying out the lighting of a library in his own way, yet it seemed to him that the subject must be divided into two parts, viz. the library itself and the tables at which people want to read and write. As regards the library proper he had very little to say except as regards the suggestion of placing lamps in a trench at the bottom of the bookshelves. This seemed to him rather a complicated way of doing it as far as the lower halves of the shelves were concerned. Personally, he would deal with that by placing the lamps in the gangway in the ordinary way with suitable reflective shades which would bring the light down on to the edges of the books, and use a white drugget or cloth on the floor to reflect a share of the light on to the lower shelves. He thought this a less complicated way, and there could be no objection to the white drugget, because it could be easily cleaned and was in itself an advantage from the sanitary point of view. It should result in the lower halves of the shelves being as well lighted as the upper portion. The question of reading books was to him a much more interesting subject and he had had a good deal to do with that in other directions. Reading is one of the most trying occupations for the eye that we know of, and it was therefore essential that the literature to be read should be illuminated at above a certain degree of excellence. The figures given by Mr. Dow certainly showed that in many libraries the reading of the literature would eventually result in the deterioration of the optic nerve. This, he thought, was brought about because the problem had been tackled by attempting to do the general lighting at the same time as the actual lighting on the books. These two things must be dealt with absolutely separately. Those who were in the habit of reading and writing a great deal learned by actual experience with their own tables that it was better to have a light upon the table, none of the rays from which could get at the eye, and to use a small general light to see their way about the room. If he had the lighting of libraries to undertake he would certainly do it in this way. The lamps on the tables should be absolutely protected so that none of the light was emitted from the tops of the shades. It might be argued that this would be too expensive as it meant a separate light for every reader, but he pointed out that these lights need only be of low candle power. It was well known that a 10 candle-power lamp at a distance of 2 feet from a book was worth a great deal more than a 50 candle-power lamp at a distance of 12 feet. The result was that for ideal reading a small unit of light must be found. Our forefathers were in the habit of using candles properly shaded, and they did not suffer from eye troubles to the same extent that we did at present. In one case he had in hand, there were 8 candle-power lamps in each of the standards; the supply was alternating current and he had adopted 25 volts in order to get that low candle-power lamp. The previous speaker had referred to the fact that metal filament lamps were fragile, but that was due to the fact that the lamps he was referring to were 200 volt lamps with very long and thin filaments. In his own case he was speaking of 25 volt lamps of low candle power on portable standards, the filaments being much stronger. But illuminating engineers dealing with a library must look for the particular class of lamp that would give the best result. As regards general lighting, it was a great pity that the books themselves must be in the same room as the reader, because that meant that the general lighting had to do a great deal more than was necessary for people when reading, but if the total scheme were carried into effect the general lights should be shaded from the eyes of the reader. The figures given by Mr. Dow would enable them to study the question of sufficient lighting for reading and writing. Some people said that 1 foot-candle was sufficient, whereas in a great many instances it was a great deal higher. The room of the Royal Society of Arts, in which they were meeting, was an example. The standards on the table gave nearer 5 foot-candles, but there was a possibility of there being too much illumination, especially when using a shiny paper. In this case the source of light was very often reflected back into the eye and caused a great deal of trouble. He hoped the Society would one day come to an agreement on these points concerning the right illumination for reading and writing.

(To be continued.)

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

At the meeting of the Society held on Thursday, Feb. 9, when Mr. Sydney D. Kitson, F.R.I.B.A., occupied the chair, Mr. F. C. Eden read a paper on "Varallo, Orta and Varese."

These small towns, situated in the lake district of Northern Italy, had a connecting link in that each possessed a notable sanctuary in its Sacro Monte, and it was to these sanctuaries and the buildings comprising them that the lecturer drew special attention.

They were, he said, started at Varallo in 1491 by Bernardino Caimi, a Franciscan friar of noble Milanese family, who attempted to reproduce the Holy Sepulchre, and probably other holy places as Golgotha and the Grotto of the Nativity. As the work proceeded the idea developed into commemorating the events of the Sacred Narrative by groups of life-size figures so that there are now forty-four chapels upon the Sacro Monte containing these groups of painted imagery.

In infinite variety of plan and design these little buildings gleaming white amongst the tree trunks or against the sky imparted a character of architectural romance to the whole mountain side.

By means of an excellent series of slides comprising views and plans of the principal buildings at each place Mr. Eden illustrated his narrative and urged that, though but the work of obscure or unknown architects, these hitherto almost unnoticed buildings were fair examples of the skilful handling of the "Renaissance box of bricks."

At the close and on the motion of Mr. H. S. Chorley, F.R.I.B.A., seconded by Mr. Fredk. Musto, A.R.I.B.A., a hearty vote of thanks was accorded Mr. Eden for his paper.

The next meeting will be held on Thursday, Feb. 23, when Mr. H. E. Henderson will lecture on the "Minor Domestic Architecture of Yorkshire."

THE PAINT AND VARNISH SOCIETY.

[STANDARDS OF COLOUR.]

An ordinary meeting of the Society was held at St. Bride's Institute on January 12, Mr. G. Depierres, President, occupying the chair.

A discussion on "Standardising Colour" was opened by Mr. Arthur Seymour Jennings with the paper printed in our issue of January 20, and entitled "The Possibility of Introducing a British Standard Colour Card for Paints and Distempers." By means of the lantern the effect of colour viewed in a sodium light was shown and also the effect of various coloured lights upon the spectrum.

The President congratulated Mr. Jennings on the able manner in which he had opened the debate. It was surprising to hear of the extraordinary fact that in no language did there exist exact names for colours, notwithstanding the efforts made by scientists for so many years, and the actual chaos concerning the nomenclature of colour could not be better shown than the example of peacock blue. If that colour were ordered from twenty different paint manufacturers it would not be surprising if twenty different shades were obtained, and the same thing might be said of canary yellow, apple green, leaf green, and many other colours. Consequently names to-day meant very little, and he thought there would be no difficulty in coming to a conclusion that to avoid misapprehension in speaking of colours it was necessary to refer to some invariable type of standard of colour, so that when speaking of blue, for instance, there should be no doubt as to whether the colour represented by Prussian blue or cobalt blue was intended. It might be argued that the establishment of a standard colour card would be an infringement of liberty or an attempt to destroy the individuality of colour makers, but personally he did not think such an argument could have much weight. The modern colour maker could produce every colour or shade imaginable. A fancy name or description might be registered, but it would be absolutely impossible to protect any colour by a patent, or if it were possible to secure such a patent it would be of absolutely no value. The use of the tintometer might have its good points, and he himself had quite an open mind on the subject, but possibly some might think it an unnecessary complication tending to render the already very difficult task much more arduous. There were four main questions before the meeting: (1) Is the standardisation of colour needed? (2) Will such a standardising be to the benefit of the paint manufacturer and paint user? (3) Do you consider the scheme can be carried out? (4) Will you as members of the Paint and Varnish Society support any resolution that may be proposed for the furtherance of the scheme?

In the unavoidable absence of Mr. NOEL HEATON, a communication from him was read by the secretary. Mr. Heaton thought the paint industry would be immensely benefited if some such scheme as Mr. Jennings had outlined could be brought into use, but its practicability at the present moment was another matter. The most obvious criticism, that the conservatism of the trade would not take kindly to any such simplifications of their problems might be summarily dismissed, because everyone was acquainted with and case-hardened against that feature of the paint industry, and it was realised that if no attempt was made to climb the wall of prejudice nothing worth doing would ever be done at all. But it had to be remembered that in certain directions the scheme would meet with interested opposition because there were a large number of people whose commercial existence depended on the present lack of scientific knowledge and the general haphazard methods of the trade. There was also something to be said from the business point of view for the proprietary name, because a man did not want people to associate his colour card with a universal scheme; he invented patent names of his own in order to sell his own goods in competition with his rivals by creating the impression that he and he alone was capable of producing, for example, "Smith's Aeroplane Pink for Painting Park Railings." Looking at the scheme from the technical point of view, it was quite clear from the paper that Mr. Jennings's scheme was for a classification of colours "quite regardless of their pigmentary composition." It was certainly essential in arriving at any such classification to insist upon a divorce between colour and substance. Then came the difficulty which lay in the fact that certain names were intimately connected with both colour and substance, i.e., the name of a particular substance used as a pigment and having that colour. The name of a colour was inevitably derived by association with familiar objects, such as rose, orange, violet, and so on, and so long as people were content to be sentimental and name colours after the flowers of the field, all was plain sailing; but unfortunately in many cases the actual pigmentary substance itself was associated with a characteristic colour, as in the case of vermilion, cobalt, and burnt sienna. Who was to decide what vermilion was, whether it was the name of the colour or of the pigment? Or would the trade be content whichever way it was decided? The scheme of colours would not be acceptable if the colour of vermilion were called by any other name, whilst if it were included there would be difficulty with the colour manufacturers who made vermilion in several different tints. The difficulty might be got over by numbering the tints, but that would at once invite failure, because numbers did not convey ideas, and it would be difficult to remember the number of any particular tint without constant reference to the list. The primary difficulty appeared to him to be one of finding satisfactory nomenclature which would eliminate those points of confusion and at the same time provide a sufficiently descriptive name for each tint, because it was essential to success that every colour name should convey the idea of the colour it represented. It was advisable to taboo empirical and silly names. For example, what was the "Venetian green" referred to by Mr. Jennings? He had never heard of the colour before, and was not anxious to hear of it again. Names of that type, electric blue, Dutch pink, hippopotamus canary, and so forth, should be relegated to the dustbin. Further difficulties in the way of classification arose from the fact that the nature of the surface and the composition and the physical conditions of the pigments used in paint affected the quality of the colour to a certain extent. His own experience, however, was that that was not of so much importance as was imagined, and that it was only with a few exceptional pigments that the selective absorption differed under different conditions of lighting so as to give the pigment a colour quality of its own. The difficulty could be got over by defining a standard composition for each tint, but that would introduce endless complications, and he thought Mr. Jennings was right in confining his scheme entirely to the classification of colour as distinct from substance. He thought Mr. Jennings showed some confusion of ideas in speaking of the scheme as being independent of the spectrum. He could not see the force of the objection that the standard tints might fade, and Mr. Jennings's method of preparing the standard seemed rather crude. He believed it was essential that the scheme should be worked out on the basis of the tintometer, each colour having some definite relation to the next, thus securing a definite and accurate colour scheme. It was curious to note that the tintometer had been used for similar purposes in almost every industry in which colour was a matter of interest except in the paint trade. He had raised objections in the sincere hope that they would be shown to be without foundation, because he thought the idea was a good one and the scheme was badly wanted; but he felt that before anything was attempted there should be a clear idea of what was actually desired, the difficulties that had

to be faced, and how these difficulties were to be surmounted. Personally he thought painters required a little more waking up first, and that the Society should gain a little more status, and instil a little more scientific thought into the industry before it took a step of such far-reaching importance.

Mr. LOVIBOND said that colour standardisation had been the subject of inquiry by many learned bodies, but there had always been theoretical difficulties, and he hoped they would not arise on this occasion, the differences being purely those of condition. The painters developed their colour by a method of analysis, by absorbing the complementaries; whereas scientific men obtained theirs by a method of synthesis, mixing coloured lights so that the one had a complex body and the other a simple body, both being of the same colour but in a different condition. Then there was the difference of observation. The artists observed their colours in diffused daylight, whereas scientific men dealt with the spectrum colours in camera, and the difference in appearance was necessarily great. He was sure that they need not influence the practical question of standardisation.

Mr. Jennings had touched the keynote of the question when he dissociated the standard of colour from the pigmentary name. Pigmentary colour was variable, and might mean anything; whereas the standard colour was constant, as being the ray composition of the light reflected from the pigment itself. With regard to the names of colours, six colours could be distinguished and isolated in the spectrum, and therefore those six must be considered the foundation. Rood stated that the spectrum could only give the names of the colours, but it could also give the harmonious associations. There were great difficulties in the use of the spectrum in standardisation. Taking a line between the yellow and the orange, the sodium line, the yellow and orange overlapped each other. At the sodium point 11 of yellow overlapped 9 of orange, making the 20 into which Rood had divided the spectrum colour depth; 11 of yellow and 9 of orange were the only possible association for those two colours, but in dealing with pigments 11 of yellow could be united with any fraction of orange, or 9 of orange united with any fraction of yellow, so that there were thousands of pigmentary combinations possible with pigments whilst only one was possible with the spectrum. That appears to shut the spectrum out as being available for standardisation.

To him it seemed a very simple matter to produce colour standards. It depended entirely upon the possibility of determining the ray combination of broken light. Every day colours were submitted to him, and he gave the light formula which created that particular sensation in the vision. In average diffused daylight he could make out any one of the 63,000,000 combinations which was distinguishable as a separate colour sensation, and after a little practice it could be determined in two minutes.

With regard to names, popular or technical names could never be destroyed, nor did he think it was desirable. If a man had invented a special combination he should have the right to name it; and to standardise it by measuring the ray combination of the colour was, as already mentioned, a simple matter.

With regard to the quality of the light used, diffused daylight was the only light which gave constant results, and there was a considerable range of diffused daylight when no difference was perceptible. Theoretically, of course, there must be differences for every variation, but they were outside the power of vision to discriminate. He had fixed the limit for his own work between 18 light units and 28, and with few exceptions within those limits the readings were constant. In any other light another condition of things was produced; the ray composition determining a specific colour naturally being altered by the impinging light if the light was abnormal. Sunlight was absolutely out of the question, and artificial lights were comparatively of little use, although most important in one sense, because a designer or artist choosing colours to be used by electric light would naturally choose his colours by that light, though they would not be in harmony in daylight, the colours themselves being constant. Therefore, one of the points to be considered was the division of light into sections—daylight, gaslight and electric light—and it would then be possible to say that by electric light the colour measured so and so, by gaslight so and so, and by daylight so and so.

One of the desirable points was to have a run of colour of one character, with no contrast upon the same card; it was far better to limit the cards each to its own harmony. He thought there was nothing insurmountable in standardisation, and he hoped the Society would succeed in the work, because he believed that it was a duty that had to be undertaken.

(To be continued.)

UNIVERSITY OF LONDON LECTURES ON ARCHITECTURE.

THE lecture at the British Museum by Mr. Banister Fletcher, F.R.I.B.A., on Tuesday, February 7, was on "The Triumphal Arches and Pillars of Victory of the Romans." These works of display and ostentation were erected by emperors or generals to commemorate their triumphs and victories, and as a history graven in stone of their deeds, for many not only bore inscriptions but sculptured reliefs depicting actual events, which have proved most useful in archaeological research. Arches and Pillars of Victory are found in various parts of the Roman Empire as well as in Rome itself, where some of the finest examples exist.

The arches at the entrance to Constitution Hill, the Central arch at Hyde Park Corner and that at the Mall are all modern examples of the one-arch type, of which the Roman examples are the following:—The Arches of Titus, Trajan at Ancona and at Benevento, the Sergii at Pola, Augustus at Susa (Piedmont), Augustus at Aosta (Piedmont), Augustus at Rimini, Hadrian at Athens, St. Rémi near Arles, and the Arch of the Goldsmiths at Rome.

The Arch of Titus in the Forum Romanum was erected in the year 81 A.D. It stands at the foot of the Palatine Hill on the Via Sacra, and was built by Domitian in honour of Vespasian and Titus to commemorate the taking of Jerusalem by the latter. It is 49 feet high and 44 feet wide. In the middle ages a stronghold was built over it by the Frangipani family, which can be seen in old prints, but this tower was removed in 1823. The arch is raised on a podium giving it height and dignity; on either side of the opening are attached half columns but three-quarter columns support the entablature at the angles. The Composite capital, the fifth order of architecture, introduced and invented by the Romans, is here used and is the earliest known example. As its name implies it is composed of the union of two other orders, the Ionic volute with the double row of acanthus leaves of the Corinthian order.

Winged Victories fill the spandrels and sacrificial scenes are represented in the frieze above. Over the entablature is a deep attic storey bearing the inscription and dedication.

The soffit of the arch is richly coffered, the sinkings being ornamented with rosettes; in the centre is an apotheosis of Titus in relief being borne up to heaven by an eagle. Below this two carved panels, forming the inner jambs of the arch, represent the triumphal procession of Titus, the horses of whose quadriga are led by Roma while Victory crowns him. On the opposite side are seen the spoils taken from the Temple in Jerusalem, the seven-branched golden candlestick, the table for the shewbread, the golden trumpet and other trophies carried in triumph.

The Arch of Germanicus at Saintes on the left bank of the Charente is an example of the two-arch type. It was erected by Augustus in honour of Germanicus, the son of Nero and Antonia, who was born B.C. 15. He fought against the Germans with Tiberius. When mutiny broke out on the death of Augustus, A.D. 14, he had command of the troops in Germany, and eventually conquered the whole country between the Rhine and the Elbe.

The monument consists of two semi-circular archways each having a span of only 13 feet. Corinthian pilasters of stumpy proportion support an entablature which forms the impost for the arches and also carries a second order of short columns, above which is an entablature and attic; three-quarter columns are placed at the angles. The whole is raised on a podium.

The following are examples of the three-arch type:—The Arch of Septimius Severus, the Arch of Constantine, the Arch at Orange, the Porte de Mars at Rheims and the Arch at Palmyra in Syria.

The Arch of Septimius Severus was erected in honour of the Parthian and Arabian victories of this emperor and his two sons, Geta and Caracalla. It is 72 feet high and has a total width of 82 feet. Originally it was surmounted by a chariot group of the emperor and his two sons, the former crowned by a Victory. In the middle ages the arch was converted into a castle and later became embedded in rubbish, but was unearthed by Pope Pius VII. in 1803.

It is held that the archway was only accessible by steps on one side and that for triumphal processions these were covered over with planks. Pedestals support detached columns in front of pilasters, both of which are of the Composite order. The central arch measures 39 feet 8 inches high by 22 feet 3 inches wide. Sculptured Victories fill the spandrel.

The two arches for pedestrians are 25 feet high by 9 feet

8 inches wide. One of the sculptured panels represents the raising of the siege of Nisibis in the Parthian war, the other the treaty with Armenia and the siege of Atræ. The attic bears an inscription, the letters of which were originally filled in with bronze, recording the good works of Septimius Severus. The bronze was removed in the mediæval period. The side arches have openings communicating with the central arch. There is in the pier on the south side a marble staircase leading to the attic storey; these stairs are lit by a tiny hole serving as window. The entablature has no modillions but the dentil course and egg and tongue mouldings.

The Janus is an example of the four-arch type; also the Arch of Caracalla at Tebessa in Algeria.

Trajan's column formed part of the magnificent scheme which was the work of Apollodorus of Damascus. The column did not stand in the Forum but in the court on the opposite side of the basilica and facing the Temple. It is a record in marble of the deeds of Trajan, whose ashes were buried in a tomb chamber beneath the column in a golden urn. This chamber is reached by a door in the pedestal leading also to the internal spiral staircase in the shaft of the column. The pedestal, which is 16 feet 8 inches square and 18 feet high, is ornamented with trophies taken in the Dacian campaigns. The torus moulding of the base is carved with laurel leaves. The shaft, which measures 12 feet in diameter below and 10 feet above, is ornamented with a spiral scroll 3 feet 6 inches wide, which, if unfurled would measure 800 feet long.

The sculptures on the scroll, which include over 2,500 figures, represent a complete history of Trajan's two Dacian campaigns, giving in detail the military and engineering methods employed. These sculptures could be well seen from the galleries in several storeys of the basilica and the two libraries which formed the three sides of the court in which the column stood.

The Doric capital in one block of marble, 14 feet square by 5 feet high, supported a colossal gilt bronze statue of Trajan nearly 20 feet high. The existing statue of St. Peter was placed there by Pope Sixtus V. in 1588.

Another example is the column of Marcus Aurelius which formerly stood in front of a temple dedicated to that emperor. It closely resembles that of Trajan and is also ornamented with a spiral band of sculpture depicting scenes of the victories of Marcus Aurelius over the German tribes on the Danube.

THE USE OF TRASS.*

THE great advantages to be derived from trass as an admixture for mortar are demonstrated in the only available practical manner by examples of ancient structures which still defy the ravages of time and accident. These results we are able to show approximately by tests conducted by more or less artificial means in the laboratory. Such tests can, however, be made more reliable by a careful selection of materials and by accurate calculations of the proportions in which these materials are to be used. The experiments should also be carried out by men of trained experience in such work, and not as is often the practice delegated to pupils or clerks of works, who have not had any special course of training.

It is further desirable that the peculiar necessities of each class of work should be carefully considered in order to ensure permanent results in this important adjunct of modern building work, and that the laboratory tests should be made with the same materials and under the same conditions as exist on the actual work.

If these are not closely observed the information obtained from the tests will be of little practical value, or at any rate entirely misleading, as for instance, if cement, lime, or trass be tested alone, or in association with, aggregates dissimilar to those which will be ultimately employed in the actual work, or under conditions of humidity and temperature different from those which will then constitute their environment, the data obtained in the laboratory cannot be relied on to ensure successful results.

It must also be borne in mind that although the binding materials, cement, lime, and trass may be of the highest quality, the resultant mixture of mortar may be inferior or even useless, owing to an absence of requisite care in the selection, proportioning, or grading of the sand and stone, which form the aggregates and incidentally, perhaps, the largest proportion of the mixture.

* A paper read at a sectional meeting of the National Association of Technical Engineers of Germany by Mr. J. Mund Cologne.

A great impetus has been given to the use of trass in building mortars by the appointment some twenty-five years ago of a commission on which were represented leading engineers and architects, together with cement manufacturers, and lime and trass quarry owners.

This commission was subsidised by the Government, and was in connection with the Royal Experimental Institute of Charlottenburg. Amongst its principal objects were those of dealing in a practical manner with the important matter of building materials on the lines indicated above, and in addition to prevent the erroneous deductions which may be obtained from tests carried out in a manner less in accordance with actual conditions.

While the use of trass in mortar and concrete had been general for engineering construction work both when under water and also when below ground for foundations, the attention of the commission was also directed to the advantages which it offered over the existing practice, by its use as an admixture for mortar in the superstructure.

To this end the specifications which lacked detail in other respects were revised, and a series of careful tests were made on new lines which gave interesting and successful results.

As a consequence, leading building engineers and architects of public works adopted these revised specifications for mortars with such modifications as were suited to the peculiar necessities of condition and environment.

The chief points for consideration in arranging the specification for mortar are strength, density, permanency and economy in cost; at the same time due regard must be paid to the quality and form of the aggregates which are available in the locality.

Amongst many other public buildings the following examples are submitted, in which specifications for mortars were drawn up in accordance with the results of the tests referred to, trass with fat lime being substituted for the hydraulic and other more or less impure limes which it had formerly been the practice to use:—New Post Office, Cologne 1892, Law Courts, Cologne 1893, Library and Record Office 1894. For these collectively some 3,000 tons of trass were used.

The Government architects of the above buildings, Mr. Brugger and Mr. Trimborn, have kindly supplied copies of specifications and comparisons of cost for the different mortars used on the work, and they have expressed their unqualified approval of results obtained.

The specification of mortar for the whole of the Library and Record Office, of which Mr. Brugger was architect, is as follows:—1 volume of trass, 2 volumes of fat lime putty, 5 volumes sand. This mixture possessed the highest efficiency in point of strength, density and cheapness as compared with the mortar composed of 1 volume hydraulic lime, 2½ volumes sand, which was the specification formerly in general use for the same class of building.

In the New Post Office and Law Courts, of which Mr. Trimborn was architect, the specification was varied in respect to proportion of sand, but no hydraulic lime was used for either foundations or superstructure. For these works the following specification was adopted:—1 volume of trass, 1 volume of fat lime, 3 to 4 volumes of sand. In a communication the architect states:—"The walls built with this mortar are excessively strong and the admixture of trass in the mortar gave much better results than could have been obtained by the use of hydraulic lime or cement for the same purpose."

For the building of the gas works for the town of Mulheim, the Government architect, Mr. Rathke, used similar specifications, the mortar being composed of equal volumes of fat lime and trass to 3 volumes of sand. Mr. Rathke reports that the mortar gave results in every way superior to mortar that contained hydraulic lime.

In the foregoing illustrations there existed no abnormal difficulties due to wet ground, and therefore a mortar of a high degree of hydraulicity was unnecessary.

Where, however, wet ground is encountered, it is necessary to use a mortar of a greater degree of hydraulicity, and the following proportions have been found the most suitable in order to secure an absolutely water-tight mixture:—1 volume trass, 1 volume fat lime, 1 to 1½ volumes sand.

It is well known to architects and builders that in cases where the mortar is not well flushed, percolation of water either under slight pressure or by capillary attraction usually takes place by way of the joints, and stone of a porous nature or badly burnt bricks could not be allowed to be used.

Owing to the natural conditions of low-lying water-bearing ground, the Dutch architects and builders have long realised the necessity for a careful selection of impervious building materials, and for the preparation of dense insoluble mortars, for which reason hard burnt bricks and trass lime mortars have been in common use in Holland for centuries.

Most of the buildings in Haarlem, Rotterdam, Amsterdam

and The Hague are evidence of the success which has attended this practice, as although nearly all the buildings have their foundations below normal water level, they show few signs of dampness or depreciation due to this cause.

The new railway station at Amsterdam may be taken as an example of a recent building on which mortar that contained trass has been used.

The volumes of lime and trass are varied proportionately to meet the necessities of the varying degrees of moisture to which the foundations may be subjected, and the proportions of the two former ingredients are reduced for the superstructure, where a less dense mortar will fulfil the required conditions of strength to maintain the stability of the building while at the same time effecting an economy in cost.

It may be suggested that some of the proved advantages of trass lime mortar may be obtained by the use of Portland cement mortar, but it is unnecessary to point out that the theoretical advantages of cement mortar are entirely discounted by the difficulties attending its use in actual practice. If the mortar is sufficiently rich in Portland cement, it cannot be spread unless water is continually added, and the stones or bricks also must be kept wetted to prevent the water from the mortar being absorbed. The result is that very little of the cement eventually remains in the mortar. This absorption does not take place in trass-lime or even trass-cement mortars.

ENGINEERING PLANT IN INSTITUTIONS

(Continued from page 70.)

Calorifiers or Hot-Water Heaters.

THESE are principally of two types. Each is built with a body to contain water, with steam tubes passing through it, but they differ in the respects that one type carries the water resulting from the condensed steam to a discharge outlet, while the other type discharges it into, and mixes it with, the water in the body of the calorifier.

In some circumstances water is heated by blowing in free steam, but this is such a noisy process that for ordinary purposes it cannot be tolerated.

Up to comparatively recent times it was quite a common practice to deliver hot condense water to the drain after leaving the heater, but it is now almost universally recognised that the utilisation of hot condense water as hot boiler feed means a great saving in fuel, and that condense water returning to the boiler at 180° Fahr. effects a fuel saving of no less than 11 per cent. in a boiler working at 80 lbs. pressure per square inch.

For the second type of calorifier it is claimed that the whole heat of the steam is made use of, and that the necessity for complications of steam traps and condense mains is avoided.

There is considerable room for development in the design of heaters, and from careful observation and experiment the writer has definitely arrived at the opinion that the rate of transmission of heat from steam to water is enormously increased by violent friction of the steam over the heating surfaces, no doubt caused by the scouring action of the steam in clearing away from the inner walls of the tube the film of condensation water, which forms by the cooling action of the water on the outside of the pipe. Water, although very efficient in removing heat by convection, is a poor conductor, and a light film between the tube surface and the steam retards heat transmission. The principle has been embodied in more than one calorifier with which the writer is familiar, but it is probably more by accident than design in at least one of those referred to. Among the most efficient heaters met with in the writer's experience is one in which the tubes are packed in closely coiled stacks, and in which the tubes double back upon themselves sharply, causing considerable friction.

Heaters are now usually fitted with a controlling arrangement for governing the flow of steam by means of the temperature. These thermostats, or temperature regulators, are of two principal types. Firstly, those in which the increase in length of the heater shell, due to increase of temperature, is made to shut the steam admission valve; and secondly, those in which the steam admission valve is opened and closed by the vaporisation by heat of a volatile liquid, enclosed inside an exhausted chamber, exposed to the water. This latter type of control valve is usually fixed upon the heater shell, but a more suitable position should be where

it can be operated by the water in the return pipe, as, after all, the return water is the true index of the temperature of any system of heating, and whether it be a heating apparatus or a hot-water supply plant the system cannot be efficient until the temperature of the returning water is normal, while it is easily possible for the temperature in the heater to rise locally and close the valve.

In this matter of temperature control low-pressure steam may be said to be self-governing in the steam supply, since the nearer the temperature of the water approaches that of the steam the less becomes the heat transmission, until, as the boiling point is approached, transmission practically ceases. It will, of course, be understood that in this connection, by the term low pressure is meant steam at $1\frac{1}{2}$ lbs. or 2 lbs. per square inch, and the writer has put in some very successful plants working with steam at this pressure.

The Kitchen.—In the matter of kitchen apparatus one institution is very like another, and only differs in the matter of the size and capacity of the plant, and also that for certain institutions special plant may be necessary.

In all kitchens steam boiling coppers, and steaming chests for potatoes and direct steam-cooked foods, are found. Steam-heated hot closets, with heated tops and roasting and baking ranges operated by coal (or more generally now by gas), are also essentials in the equipment of the modern institution kitchen. The special supplementary apparatus consists of beef-tea making boilers and cooking coppers for cooking gruel, and apparatus for milk sterilising in hospitals and infirmaries.

In the kitchen also it should be remembered that all clean condense water, from the jackets of boiling coppers and hot closets, should be saved, and turned into the main condense return pipe, to be re-evaporated in the boilers. But enthusiasts of economy should not let their zeal carry them to the lengths of saving the condense water from contact cookers, such as potato steamers, as the grease carried off by the steam is as likely to cause trouble as the grease from cylinder lubrication; yet the writer has many times seen this done.

Two of the problems connected with kitchen equipment are the prevention and the removal of vapour in the kitchen, and adequate ventilation by the removal of the heated air inseparable from cooking operations. With the first-named the design of the vapour-producing apparatus has much to do. Boiling coppers should for this reason have their covers, or lids, sealed against vapour by a water seal, and suitable provision should be made to carry off the vapour generated inside the copper while at work. Of course, the very simplest method of doing this is to carry a vapour pipe direct from the interior of the copper to the open air. This, however, has its disadvantages, as cooking odours are thus disseminated all round; instead of carrying up a multitude of vapour pipes several such pipes are often connected into a common collecting-pipe, and discharged to the atmosphere; but this may result in discharging the vapour from one boiler to another.

One of the best methods of dealing with this vapour is to carry it into a common pipe, which is placed in a trough of running water behind the coppers, condensing the vapour as fast as it is formed, the outlet of which is discharged to the drain.

The draw-off taps from boiling coppers should always be made so that they may be easily taken to pieces for cleaning, and a good practice is to fit them with a removable plug on the front, so that a wire may be passed right through.

It is a decided advantage to have boiling coppers provided with a metal scale on the inside graduated in gallons; this is much more convenient than measuring out the liquids, and saves much time.

Steaming chests call for some remark, and a glance at the principles of cooking in these may be of some interest. It is quite a common idea that the cooking is carried out in these steamers by pressure, but as this idea is a mischievous one it is worth notice here that the pressure has nothing more to do with the cooking than the fact that the temperature of the steam increases with the pressure. The operation in contact steam cooking is that the steam condenses in hot water upon the food being dealt with, and which is maintained automatically at a constant temperature, owing to the fact that the heat of condensation is practically constant at that of the steam.

For this reason the steam inlet of the steam cooking chest should always be made small in size, and the inlet valve of the seating type, so that the steam may be wiredrawn or throttled, so that no more steam is admitted than just requires to fill the chamber without pressure.

Pressure should never be bottled up in one of these steam cookers, owing to the large unstayed flat surfaces which they

invariably contain. A relief valve, weighted to lift at a few ounces per square inch, should be fixed to each compartment, and instead of the common steam trap the outlet should be formed in a water-sealed syphon, so that in the event of any pressure accumulating it may have a free blow-off to atmosphere. This discharge pipe should, as before remarked, be carried to the nearest drain.

Steam cooking chests should also be fitted with some arrangement which should render it impossible to open the door while steam is on. Many accidents may be prevented by this precaution.

Beef-tea making, milk sterilising and gruel making should not be carried out in steam-jacketed pans, the direct application of steam heat causing damage to its contents. The jackets of these apparatus are supplied with water through a small auxiliary feed cistern, supplied through a ball valve, and a steam coil of copper pipe is fixed in the water jacket to heat the water.

Hot closets and tables call for no very special comment, except perhaps to mention that where steam is not available it is quite possible to heat these by hot water from a hot-water service supply, and which is quite successful.

Tea-making machines are an equipment of most kitchens, and are of various designs. Some few are met with where the tea is brewed in a cast-iron boiler, but this is not to be recommended, as the action of the tea upon the iron causes a discoloration of the brew. In other types the tea is made in a tinned copper pot, and yet in others, and best of all, the brew is made in an earthenware receptacle. In every case the water is never taken direct from the ordinary hot-water service pipes, but is separately boiled in a cylinder fixed over the teapot specially for the purpose.

All gas-cooking apparatus, and other plant giving off cooking fumes and vapours, should be fixed under a metal hood, or vented to a flue. The hood, or canopy, is fitted with a vent pipe delivering into a flue fitted with a fan, which performs the twofold function of ventilating the kitchen and keeping it free from vapour. Central fire-cooking ranges are also provided for in the same manner, and the capacity of the fan should be such as to be capable of drawing off the air from the kitchen at least once every five minutes.

All jacketed pans should be lagged, as also all other apparatus, such as gas ovens, &c., to keep down the heat, which would otherwise make a kitchen intolerable.

(To be concluded.)

[The Editor will not be responsible for the opinions expressed by Correspondents.]

The Land Tax.

SIR,—All who have studied the reports of last night's debate in the House of Commons must now realise how greatly the real effect of the land taxes differs from the anticipations and theories put forward by their authors.

Concrete cases of loss and hardship were brought forward in this debate, but the only reply vouchsafed from the Government side was a repetition of the threadbare statements as to the rapacity of landowners, and the advocates of the single tax were conspicuous in pressing their demands for imposing yet further burdens upon all land, both agricultural and urban.

It is obvious that we are in a critical stage of a great struggle between the land-taxers and the Land Union. The former have the support of 143 Radical and Labour members, and have a minimum campaign fund of 5,000*l.* a year from Mr. Fels, the American millionaire. The Land Union has, as last night's debate shows, nothing to fear from the arguments of the land-taxers in the House of Commons, but it can only meet and defeat their propaganda in the country if it receives the financial support and active co-operation of all who sympathise with its objects.

May I appeal to all such to enrol themselves and send a donation or subscription to the Secretary, St. Stephen's House, Westminster?—I am, yours faithfully,

E. G. PRETYMAN.

FORTHCOMING EVENTS.

Saturday, March 4.

Architectural Association: Spring Visit to the Recruiting Station and Stables, Whitehall.
Edinburgh Architectural Association: Visit to (1) General Post Office, (2) New Galleries of the Royal Scottish Academy.

Monday, March 6.

Architectural Association: Mr. A. R. Jemmett on "The Functional Application of the Orders to Modern Buildings."
Liverpool Architectural Association: Paper by Mr. Ernest Newton, A.R.A.
Victoria and Albert Museum: Mr. Banister Fletcher on "German Romanesque Architecture." (University of London lectures.)

Tuesday, March 7.

British Museum: Mr. Banister Fletcher on "Early Christian Basilican Churches and Baptistries." (University of London lectures.)

Wednesday, March 8.

Northern Architectural Association: Announcement of Awards in the Glover Travelling Studentship and the Students' Prize Competitions.
Exhibition of R.I.B.A. Prize Drawings.
Carpenters' Company: Mr. Noel Heaton on "The Use of Glass in Building."
Manchester Society of Architects: Mr. J. H. Sellers on "The Architect's use of a Library."

Thursday, March 9.

Society of Architects: Mr. W. S. Frith on "The Relation of Sculpture and Carved Ornament to Architecture."
Carpenters' Company: Professor Beresford Pite on "St. Paul's and the Bridges."

COST OF SCHOOL BUILDINGS.

IN the provision of every class of building that is paid for by public money, and hence not subject to commercial restrictions of finance, there is a tendency to a constantly increasing ratio of expenditure, which is partly no doubt due to the fact that such buildings are apt to be urged forward in development and progress by experts. Baths, workhouses, hospitals, asylums, and other publicly provided institutions are the object of study and attention by architects, and their critics and advisers, medical or otherwise, who are continually seeking improvement. This frame of mind naturally leads to increase of cost, and a point is at some time reached in which it is felt that the expenditure is more than the State can afford in view of the ever-increasing number of directions in which social reform is being pressed forward. The public purse is no doubt deep and well-lined, but there is a limit to the burden-carrying capacity of even the British taxpayer. Old-age pensions and free meals for children may be excellent forms of public benevolence, but if millions of money are required for these purposes there must be economy in other directions, since at the present time the wealth of England is not increasing at a sufficiently rapid rate to permit of any large or indefinite expansion of political altruism.

Amongst the several classes of public buildings of which the cost has been advancing at a rapid rate are our schools. Hence the appointment of a Departmental Committee "To inquire and report—(a) Whether the cost of buildings for public elementary schools can properly, and with due regard to their suitability and durability, be reduced by the use of materials or methods of construction different from those ordinarily employed at present; and, if so (b) What steps should be taken to facilitate the adoption of such materials or methods, and whether any alteration of the law is required for the purpose."

The Report of this Committee has just been published and does not add much to the knowledge that most architects possess, particularly if they have had special experience in school building, when, to put the essence of the report in a nutshell, the Commissioners answer the first question in the affirmative and recommend on the second point of their reference that school buildings shall no longer be subservient to building acts and local by-laws.

In the course of their Report the Commissioners allude to the well-known facts that in the period immediately following the Elementary Education Act of 1870 it was found to be possible to provide schools in most localities at a cost of 5*l.* or 6*l.* per place, whilst the cost of a modern permanent school erected under favourable circumstances according to ordinary modern practice cannot be put much under 10*l.*, and a reasonable estimate for an ordinary

building designed with due regard to economy would range from that figure up to 13*l.* 10*s.* per head, according to the provision made for halls and instruction in domestic subjects and manual work.

The Commissioners recognise that a considerable portion of this increase of cost results from conditions that are not under the direct control of the local education authorities. It has, in fact, arisen from the requirements of the Board of Education (and its predecessor, the Education Department). The minimum eight square feet of floor area which was considered sufficient in 1870 has grown to ten feet. To this has been added a "central hall" followed by extra rooms for special subjects, laundry, cookery, manual training, and so on. Now, although not mentioned in the report, the "hall" is to be no longer "central," but following American and German practice a distinctly "insulated" feature, leading necessarily to an extension of corridors and additional expense. The requirements in respect of cloak rooms and sanitary adjuncts are to-day also considerably in advance of what sufficed in 1870.

It is really marvellous that in face of the constantly growing demands for additional space, those architects who have specialised and become experts in school construction have attained so high a skill in economical planning that the increase of cost from the 5*l.* or 6*l.* per place in 1870 to the 10*l.* or 13*l.* 10*s.* of to-day is no more than it is.

Criticism of the amount of accommodation required for teaching was beyond the scope of the reference to the Commissioners, and it is for educationists rather than for architects to say whether the requirements of the Board of Education are not considerably in advance of the minimum for reasonable efficiency, but we can confidently assert without fear of contradiction that it is the growth of these requirements that has brought about the increased cost of the public elementary schools of to-day as compared with those of the seventies in the last century and the presumed waste of public money on schools that has become a popular cry.

In view of the continually varying opinion of the Board of Education as to what constitutes proper provision and equipment for public elementary schools, there is a great deal of importance in one question to which the Commissioners gave some attention, the "useful life" of school buildings. If schools are to be regarded as out-of-date within a few years of their erection, and in consequence to require rebuilding or drastic alteration, we agree with the Commissioners that "The ingenuity of school architects may well be directed to find a satisfactory type of semi-permanent school building which shall be cheap to

erect, inexpensive to maintain, cool in summer, and warm and dry in winter." Quite so. If the Board of Education will instruct school architects that the most perfectly planned building they can devise to fulfil the requirements of to-day will be out-of-date in ten years' time, the architects can construct buildings whose durability will not be excessive. But to do this it is imperative that the architects shall not have their hands tied by the hard and fast regulations and restrictions of the Building Acts and by-laws which to-day render obligatory the construction of buildings of very considerable durability and consequently expense.

(To be continued.)

BRICKWORK.*

By MR. WALTER CAVE, F.R.I.B.A.

(Official Report.)

IN studying the use of any particular building material it is essential to trace its development, and to see how it has been used in the past, so that we may make up our minds as to how it can best serve our purposes to-day.

I know that there is an opinion held by some modern designers—that this study of the past cramps our ideas and tends to mere copying of ancient examples. I would answer them that all history is against them, that we have proof on every side of us that the old builders used the experience of others, and in this way art advanced steadily, eliminating what appeared to be useless, and each age in its turn added to the store of knowledge, and thus built up by degrees the great monuments which we now see, each generation improving and adding so as to suit their particular requirements, both consciously and unconsciously. In other words art must be alive and kept alive if it is to endure. But it is just as impossible to ignore the past as it is to avoid the present, and if we are to advance it seems to me necessary to thoroughly understand how the point has been reached from which we intend to start.

I do not propose to-night to give an historical lecture on brickwork, though the subject would be a fascinating one, at least to me, but I shall endeavour to place before you, by a series of examples, the possibilities of this material as it has been used and is being used to-day, and inevitably the work of hands long dead must enter into my explanations.

The late Mr. G. E. Street, in his valuable book on "Italian Brickwork," has little opinion of ancient brickwork in England, and even goes so far as to say that where we find it here after the fifteenth century "it is seldom remarkable either for any singular beauty or originality of treatment," and he adds that "in this matter we are obliged to go to the Continent for information." It must not be forgotten that these words were written more than fifty years ago, at the height of the Gothic revival, by a great and sincere man, whose sympathies, judging from his work, lay more on the Continent than in his native land. But I quote them for that very reason—for until comparatively recent years it has not been the fashion to study and appreciate the mediæval architecture of England, and especially the fine series of domestic buildings which have become familiar to us all through the medium of many splendid volumes.

The time at my disposal makes it necessary to keep my remarks within definite bounds, and for this reason, and influenced by the words of Mr. Street quoted above, I determined to confine my lecture mainly to English brickwork.

It must be remembered that bricks are in reality an artificial material as compared to stone, granite, marble, and wood. They can be moulded and shaped to our requirements, and herein lies the danger of their misuse. To attempt monumental work on a vast scale in brickwork seems nearly impossible; the smallness of the material is such a manifest incongruity to the necessary size of the parts, and its perishability is a fact not to be disregarded. Even the Romans, who used bricks on a scale unapproached by other nations before or since, could not overcome the difficulty—and we must all feel that the Baths of Diocletian might have still been a wonder of the world if the stones of Baalbec could have been quarried on the Campagna. The effect of material on the formation of a style is a subject familiar to all students of architecture. It is not difficult to appreciate the effect of the great limestone strata which runs through the West

country on the quiet, dignified, and absolutely appropriate architecture in the Cotswold Hills; the effect of the quarries of Carrara on the warm, mellow walls of the Baptistery and Cathedral at Pisa; or the effect of the great pine forests of the Baltic on the homely domestic buildings of the Scandinavian Peninsula. And in the same manner the clay fields of the Thames and the Po, or the great alluvial plains of the Low Countries, have each had their influence on the architecture of the locality.

Bricks as a building material have been used as a substitute for stone or marble from the earliest times. Where the harder building materials were obtainable we find brick rarely used, but since the introduction of railways and other forms of transport have made bricks cheaper than even the local stone, we now find that in all accessible places brick is the most economical material for building.

This has had a bad effect on architecture generally, and has gone a long way to destroy local traditions in building—the brick being used as a cheap substitute for stone walling, without knowledge of the material or any attempt to utilise its possibilities. Everybody knows the disastrous effect of red brick cottages introduced amongst the cool grey tones of the granite and rough-cast buildings in Scotland, which harmonise so well with the character of the Scotch people and their country. Very different is the result of the use of bricks in those districts where stone was unprocureable or too expensive for general use—such as Norfolk and Suffolk and the Low Countries across the North Sea. Here we find fine tradition of brick building lasting from the time of the Romans (as at Colchester) down to the present. Take as a typical instance the town of Bruges, in Belgium, where the brick gables in the narrow streets show an astonishing variety of treatment, and are an object-lesson of the right use of the material. As a rule the bricks are small, much smaller than our commercial brick of to-day, and the joints are wide; the moulded portions are kept in good proportion, and if these designs were translated into stone they would lose at least half their charm and meaning. Doubtless, a certain quality is due to age and decay, for there are few bricks which are pleasant in texture and harmonious in colour which do not very soon show the effects of the weather and atmosphere—but, as Lewis Day observes, "What then?" Beauty is beauty, and if it comes of decay (which we cannot hinder) let us at least enjoy the beauty of decay, and not give it over to the restorer.

If we follow the geographical position of all the great brick buildings we shall find them placed in the low lands, and mostly in the river basins. This is only natural, and the geological map will indicate that it is in these positions the great clay beds occur, from which, in England at any rate, the valuable brick earths are obtainable.

In dealing with architectural use of materials in England it is impossible to avoid reference to the effect of external influences. The situation of the British Islands at the extreme North-Western corner of Europe is of importance in consideration of this subject. The whole history of the development of art will show that the movement from the earliest times has been in our direction, and the result has been two-fold.

1. That (as Mr. Gotch put it in describing the early Renaissance architecture) "as the stream of the Renaissance flowed across Europe it became tinged with the peculiarities of the various lands over which it passed."

2. That we were always the last to receive, appreciate, and develop on our own lines any influence arising from the great movements in art which started in the East.

The first great influence we received was from the Italian workmen who were imported by Henry VIII., and the evidence of their work is seen at Hampton Court in the terra cotta medallions of the Emperors which were executed by Giovanni de Majano about 1520. It has been stated that there were Italian influences at work before the beginning of the fifteenth century on our eastern coast, as at Great Snoring and East Barsham. But without doubt this particular form of enrichment was due to Italian workmen, and we can see in the elaborate parapets at Sutton Place, Guildford, and Layer Marney, in Essex, the intricate Italian detail handled with a certainty and ease which is very different from the first crude attempts of our own builders to cope with the details of the Renaissance.

This elaborate Italian work never took root, and terra cotta as a building material, with a few isolated exceptions, ceased to exist at the end of the sixteenth century. I may here quote what Professor Blomfield says on the subject: "With good reason the sound taste of the English rejected it as harsh and discordant with the beautiful texture of their

* A lecture delivered at Carpenters' Hall on February 22. Fifth of the Series on "The Arts Connected with Building."

brickwork. The charm of the work at East Barsham is due to its disintegration; where it remains in its original state and unimpaired by the weather it is quite as unpleasantly hard as modern work. Moreover, as its manufacture must always be mechanical, no alteration could be made in it, no slip of the chisel could be converted into some happy fancy. Nothing more was heard of terra cotta in this country as a building material, until it was revived as a commercial speculation in the latter half of the last century."

Christopher Wren, and that master's work at Hampton Court probably owes its fine brickwork to the influences of his Royal client. The brickwork in the Eastern counties and the towns on the estuary of the Thames shows the strongest proof of the Dutch influence—as was only natural with a maritime nation.

During the great house building period of Elizabeth's reign the Dutch and German forms of the Renaissance were unfortunately pre-eminent, but in the matter of brickwork

MOYNES PARK, ESSEX.—From a Photograph by Mr. F. R. YERBURY.

As we have seen, the Italian influence on brickwork in England was mostly felt in the introduction of terra cotta ornament, executed by Italian workmen. This influence only lasted about forty years, and at the death of Henry VIII. the Italians disappear, their disappearance due in all probability to the religious disturbances of that time. During the reigns of Elizabeth and James I. we find a new influence at work connected with Germany and the Low Countries. There are many things to account for this new development,

there is little to regret. But English brickwork had its own fine individuality before these foreign introductions, and as an example of good taste and workmanship it is unsurpassed. Its mellow colour and bold wide jointing give a peculiar charm to this material, and though we gained something from the foreigner, our own brickwork emerges a thing of great beauty and refinement.

[The slides here shown by Mr. Cave included two of Bruges; the first being a typical scene showing various brick

the similarity of religion, geographical position, maritime intercourse, and, above all, the bitter persecutions instigated by Philip II. against the Lowlanders and carried out relentlessly by the Duke of Alva, which drove thousands of the inhabitants of those flourishing States out of the country, and 150 years later, when William the Stadtholder accepted the throne of England, the influx of Dutch artists which followed brought renewed impetus to the movement, which can be seen in the fine brickwork executed in the time of Sir

designs, and the other the belfry as being a fine example of brickwork. Sutton Place, Guildford, shows the danger of the material—more especially in meaningless repetition. At Layer Marney there is a curious mixture of Italian and Gothic detail which is reminiscent of the churches of Italy. There is also an Italian feeling at East Barsham. Views were also given of Hampton Court and Great Snoring Rectory, Norfolk.]

Brick buildings may be divided into two classes:—

A. Those buildings where the walling alone is of brick, and the architectural features, such as doorways, string courses, window dressings, &c., are of stone. These are as a rule examples of the earlier buildings in England.

B. Those buildings where the architectural features as well as the walls were of brick or terra cotta. These are the true brick buildings, and represent the later architecture of England, with a few notable exceptions.

Mr. Cave then showed examples of each of these two types, describing some of the main features in each case. A strict chronological order is impossible, as there was necessarily a certain amount of overlapping.

Moynes Park in Essex dates from about 1580. Four bricks of the ordinary walling measure about $11\frac{1}{2}$ inches to the foot, and are a fine warm colour. The coping of the gables and garden walls is of brick. The great chimney stacks are good examples of what can be done with a bold simple treatment. The mortar joint, about $\frac{3}{4}$ inch, is flat and has weathered well in most places and is still sound. It is slightly set back from the face of the brick, and consequently there is a slight irregular shadow on each joint which gives a tone to the whole face. Stone, at all times a rare material in the Eastern Counties, is sparingly used. The north front has an unusual treatment in the alternate gables and bay windows. The entrance porch shows a pleasant proportion of stone to brick, and the effect of the jointing should be noted also. On the south wall are great chimney stacks which on plan are three shafts.

Another good example of these composite buildings is

breadth and dignity of Moynes or Cobham. A point to be noticed in these Tudor brick buildings is that those which have no stone quoins at the angles have a far better effect than those buildings in which they occur. For instance, Oxburgh and Buckden Towers, as there is no hard outlining produced by the stone quoins, have infinitely more breadth and repose than Burton Agnes, in Yorkshire, built about 1602.

Brecles Hall, Norfolk, is a typical moderate-sized East Anglian house, built of 2-inch bricks with a $\frac{3}{4}$ inch joint. The mullioned windows are composed of moulded bricks of the usual section of the sixteenth century. The heads and transoms have vertical joints. The interesting feature of this house lies in the fact that the window mullions, heads and jambs were covered with a thin coating of lime plaster to imitate stone. This method of treating brickwork is not uncommon in the Eastern Counties, where stone is scarce. This plaster is spread out over the jambs and finished in square patches to give the impression of stone quoins. There is a certain amount of Dutch feeling about the building, due to the treatment of the parapets of the forecourt wall; but on the whole the work is English in character. Kew Palace (1631) is a complete brick design. Great care was here given to classic detail, though it was all in rough brickwork.

The Pocock School at Rye is an interesting example of an early Renaissance brick building, depending on good proportion and proper use of material for its effect. It is a good instance of Italian forms with rough brick.

At Groombridge Place the general simple lines and

Cobham, in Kent. Here again we find a very pleasant proportion of brick and stone. The general effect is that of a brick house with stone introduced in just the right amount to give variety of colour and richness. The measurement of the bricks in this is $2\frac{1}{4}$ inch, and four of them rise to a height of $11\frac{1}{4}$ inch, which gives a joint of about $\frac{3}{4}$ inch. The absence of stone quoins is to be noticed. Instances of this type of buildings could be endlessly produced, but the character of the brickwork does not vary much. Other examples are Littlecote, Kentwell Hall, Eton College, Burton Agnes, Ragdale, and Brickden Towers.

The second type of brick buildings mentioned above are those in which stone is not used, or if used it is quite subordinate to the whole design. These are the true brick buildings. During the Tudor times we have several instances, such as Layer Marney (1520) and Sutton Place (1523), both of which show the early use of terra cotta and, as has been mentioned, have a strong Italian influence. But there is little in these buildings to differentiate them from the other Tudor buildings of the time, as far as the brickwork is concerned. The actual bricks and terra cotta are merely made to take the place of the stone and fulfil the same functions.

The great tower at Layer Marney is in many ways the most remarkable achievement in brickwork in the country, and is certainly a stately and imposing structure. Sutton Place strikes a different note, with its delicately modelled terra cotta mullions and parapets; but it seems to lack the

good proportion are conspicuous. The brick quoins and plain brick stacks likewise may be noted.

Other buildings noted were the Deanery Tower at Hadleigh, Suffolk; Oxburgh; Metford Hall; the Orangery at Kensington Palace; Blue Coat School, Westminster; and an eighteenth century house in the Close, Salisbury.

The later types of the purely brick buildings which occur in abundance from the time of Charles II. onward through the reign of Queen Anne and the Georgian Period show a use of the material which is quite distinctive. Quiet and dignified with their coloured brick quoins, shallow pilasters and moulded brick cornices, they show what can be done with good brick, simply and properly used. Out of so many good examples it is difficult to choose, but Kew Palace is fairly typical of this class of work.

Consider the detail of the brick walling itself. In this relation there are several points to be remembered—the size of the brick; its colour and weathering qualities; the bond or method of laying it; its pointing.

The size of the brick to be used is a matter of the greatest importance, and to some extent must depend on the scale of the building. Nowadays it is possible to obtain bricks of a much smaller measurement on the face than it was twenty years ago. Many architects have realised the beautiful effects which can be produced by the 2-inch bricks, and hence the demand has made the brickmakers give attention to their manufacture. In studying the old work one finds that the

Tudor bricks usually measured about 2 inches, but they were very irregular in shape. No doubt this fact adds largely to the charm of the walling. For most buildings the smaller brick gives scale, and if used with a wide joint takes off the crudity of the whole effect, which I think is a legitimate object to be aimed at, but the manufacture of an antique effect by combining bricks of all sizes with stones and flints,

BRUGES.—From a Photograph by Mr. F. R. YERBURY.

&c., in a haphazard way is, to say the least of it, a dangerous experiment, and open to criticism on the ground of affectation. Such good results, combined with solid, sane construction, can now be got with the bricks in the market that it is unnecessary to go out of one's way to imitate the chance effects produced by time and accident.

The weathering qualities of a brick depend on a great variety of conditions—the chemical properties of the earth, and their taking the atmosphere to which they are to be exposed. To enter fully into all these conditions would involve a disquisition on brick-making which is not within the scope of this lecture. To a certain extent we have to be guided by the experience of others in this matter, and in order that we may proceed without further delay I will imagine that we have selected a brick with due regard to its weathering capabilities. And then comes the all-important question of colour. If we are building in a brick district it is well to use the brick of the locality; it is far more likely to harmonise with the surrounding country, and happy is he who can bake his own bricks on the site. I know an instance where a large house was built in the country, when the house itself was faced with the deep crimson bricks from Fareham, a hundred miles away, and the smaller buildings on the estate were built with bricks burnt on the spot. The latter have within thirty years toned down into the landscape, whilst the house itself always has an exotic and unnatural appearance.

The colour and texture of the brick have also to be considered in relation to any stonework used in connection with it. As a rule the hand-made sand-faced bricks are preferable with most stones, and a variety of tones is most desirable. The dark vitrified headers and those bricks which vary in colour in themselves are most valuable, but unless especially instructed the builder will throw them out, as his idea is usually to produce as even an effect as possible. The very deep red bricks of some localities, such as those from Fareham just mentioned, are rarely successful away from their district. It will be found, I think, generally that a medium colour, well diversified in tones, will produce the best results.

Everyone knows the use made by the Tudor builders of the dark blue vitrified headers; curious irregular diapers were formed, which helped to give interest to the wall surfaces. Instances can be seen at Eton College and Hampton Court and Sandon Church, Essex, and Nether Hall. This method

of breaking up the wall surfaces may be picturesque enough in these old buildings, but I am not at all sure that the breadth and dignity of the wall does not suffer, and in modern buildings where this effect is aimed at I have often wished it had been omitted; the danger seems to lie in making the pattern too regular. I am very far from despising these particular bricks, as I think that they add very much to the general broken effect of colour, but I much prefer them as used in the eighteenth century introduced as headers in the Flemish bond, or even as on a house in Wallingford, where the whole facade is composed of these blue vitrified bricks, with red brick dressings to the windows and string courses.

Nowadays we have bricks of all colours at our command. Some are apparently only surface stains, which I do not think will stand the test of time, but many of these lilac and brown bricks are admirable in colour and quality, and if used with red bricks of the right shade, can produce as pleasant an effect as the old time-worn buildings of the past. It requires knowledge and judgment to select the right coloured bricks from amongst many samples laid before you. It is best to have a small piece of wall built up and see it from a distance in order to judge of the effect; bricks look so different in the mass and in the open air.

The bonding of brickwork is of considerable importance both from a practical and artistic point of view. Bond is the arrangement of bricks so as to prevent the vertical joints from falling into a continuous line, and to distribute the pressure over as large an area as possible. There are many varieties of bond, but the two most commonly in use are known as English and Flemish bond. English bond is laying the bricks in alternate courses of headers and stretchers, and Flemish bond is laying headers and stretchers alternately in the same course. Of the two the English bond is the strongest, as there is more tie through the wall on account of the greater number of headers.

Most of the Tudor buildings were built with English bond, such as Littlecote, Cobham, Moynes, Bramshill, Holland House, West Wood Park, &c., to name only a few. But by the end of the seventeenth century the Flemish bond is found in such houses as Chichely, Sudbury, Rutland Lodge, Peter-sham, and Groombridge, and the Orangery at Kensington. During the eighteenth century, when the use of the blue vitrified headers was a fashionable feature in the stately Queen Anne fronts, the Flemish bond was universally used to produce the diaper patterning which has been referred to

THE BELFRY, BRUGES.—From a Photograph by F. R. YERBURY

above. If the bricks which you are using have most of their broken colour confined to the ends, which is usually the case, then English bond is apt to produce horizontal lines, which is disturbing to the breadth of the whole, and the Flemish bond will give the best result.

Nowadays, when hollow walls are so much more in use,

with the outer skin of brickwork only four and a half inches thick, the question of general strength is somewhat altered, but the Flemish is the best in that case, as it does not necessitate so many half bricks, which are a source of weakness to the wall.

Of no less importance than the bricks themselves is the mortar and its pointing or treatment. The methods of treating the mortar are so numerous that it is impossible to mention them all. Every architect seems to have his own special method. Putting aside the hateful tuck pointing which is both inefficient and ugly, I will mention a few varieties. The common weather jointing is serviceable, and if properly done not ineffective, but in nine cases out of ten the bricklayer uses his trowel pointed downwards instead of upwards, which, instead of producing a weather joint, exposes the edge of the brick to all the actions of the weather and dirt. Then we may notice the flat joint, which leaves the mortar and brick absolutely flush; this is always satisfactory in appearance, especially when, as always should be the case, the work is done in the actual mortar used in building the wall before it is dry and as the brick is laid. But pointing in the usual meaning of the term in the bricklayer's mind is to rake out the joint either before or after it is dry and then fill in with a totally different composition, which, unless the whole is kept thoroughly wet, fails to adhere to the actual building mortar, and in course of time drops out. Of course this is necessary when repointing old work, but should not, in my opinion, ever be resorted to in new buildings. The danger of this flat pointing is that if the mortar is not cleaned off thoroughly from the face of the brick, and even a small amount is left projecting, the wet will run down the wall and lodge, and gradually working behind will penetrate and in time cause it to decay and fall off in frosty weather. There is, as I have mentioned before, a great tendency to-day not only to reduce the size

NETHER HALL.—From a Photograph by Mr. F. R. YERBURY.

of the brick itself, but to increase the width of the mortar joint; this can be carried to excess, and I have seen walls that look as if they were made entirely of mortar with a few bricks let in at intervals.

Of course everyone has his own predilections in a matter of this kind, but I think a good working proportion is $\frac{3}{4}$ inch joints and $1\frac{3}{4}$ or 2 inch bricks. Then we have the pressed-in joint, which is very weather proof; or even the joints raked clean out for a distance of $\frac{1}{2}$ inch (like the Church House, Westminster); but this lets in the weather and is ineffective if the bricks are even and machine made as in that instance. Both these last methods give a shadow at each joint which produces a tone over the whole surface of the building like a wash of grey colour, and softens the crudities of a new brick wall. An interesting method is sometimes seen of forming a moulded joint. This is done with a specially made

pointer like a stone mason uses for rough stone walls; it has a moulding worked on the face and is pressed well home, so that a series of small shadows is the result. This also gives a general tone to the whole surface; it requires an even and true brick. I found it for the first time on an old school building at Ottery St. Mary in Devonshire, which dated from the time of William and Mary, and may very likely be of Dutch origin.

It is a convenient point here to say a word about the mortar or cement in general use. Cement is the strongest material mixed with sand, but produces an unpleasant blue grey colour; it is also very liable to be attacked by frost; it has the advantage of setting rapidly. Then, as I have said, it is best to make the joint in the same material, using as light a sand as is procurable, and pressing the joint well home so as to prevent its being exposed more than necessary. A good lime mortar is, I think, the best of all, and produces a pleasant cream coloured joint if the sand is of a light tone, and in course of time sets as hard as cement and is not so brittle in the exposed parts.

The practice of colouring the mortar is bad, and I believe any foreign colouring material, such as lamp black or oxide of iron, must have an injurious effect in course of time. In districts where a good sharp sand is unprocurable except at great expense, sifted cinders are universally used for all mortar in its place, and this, I think, should, like the cement, be pressed well back in the joint out of sight.

[Slides here shown by Mr. Cave illustrated work at Sandon Church, Nether Hall, and Shelley Hall, Suffolk.]

There has been a great revival in the intelligent use of bricks during the present decade. A visit to the Garden City at Hampstead is worth anybody's time if they are interested in this subject. A noticeable feature is the ingenious way in which ordinary roofing tiles can be used in connection with bricks to give relief to a brick building. Arches, over-sailing courses, lintels, ventilators, &c., can all be formed of these, using the tiles as small bricks.

Amongst the many simple effects which can be produced in a brick building, the angle quoin is perhaps the most important. There are several varieties of brick quoins, as we shall see in the illustrations, but care should be taken in building them to preserve the continuity of the bond, or the angle becomes a weak point on account of the very feature which is intended to give it strength.

In brick architecture the strongest walls are those with the fewest ornamental breaks and projections, and great care is needed in designing pilasters, quoins, &c., to maintain the bond and not to interrupt the construction of the wall.

Great unbroken wall surfaces have a fine quality of breadth and dignity, when the brick is good in colour with properly struck joints. At Montreuil, near Boulogne, there is a great fortification standing on a hill overlooking the town; its walls and bastions of varied outline towering to immense heights are one of the most imposing sights I have ever seen. And the great brick forts on the Portsdown Hills which overlook the town of Portsmouth have a distinctive character and all the charm of a material which is properly used.

Bricks are now very largely used for fireplaces, not only for the linings and hearths, but for the whole mantelpiece, and in a certain type of house these can look very well; but I think there is just a possibility that this very fascinating material may be overdone and misused in the desire to produce new and original effects in interior decorations.

Amongst the many interesting details connected with brick buildings, the chimney stacks have always been treated with especial care, and in many cases with extreme elaboration. Bricks are eminently suitable for flues and stacks which have to stand considerable variations of heat and cold, and in many stone houses we find the stacks built of brick.

It is only possible to give a small idea of the great variety and ingenuity shown in these stacks. Sometimes we find the flues grouped into masses of solid brickwork with the shafts themselves merely indicated by V-shaped grooves. In others the flues are in detached circular and octagonal built shafts, highly enriched like those at Eton College and Hampton Court, but the caps are joined to tie the whole design together.

Some of the details of Elizabethan work would lead us to suppose that the builders of these great country houses were not really very careful designers, and this impression is intensified by the frequent misuse of the early Renaissance details which, as I have already pointed out, were often misunderstood and show signs of being taken from what were really German pattern books. But these

brick stacks are marvels of ingenuity in design, and are evidently the work of highly-intelligent craftsmen. Anyone who has taken the trouble to set out full size the twisted shaft for a chimney stack will know what I mean, and it must be remembered that these shafts must have been set out and the moulds made beforehand, for no mere rule of thumb or accidental effects could produce the results we see and admire.

A point to notice with all chimney stacks is the great importance of the amount of projection of the various members. It is impossible to lay down rules for this, conditions vary so greatly. I think in most cases failure is due to giving too great a projection to the over-sailing courses. One has to remember that the stack is generally an isolated object seen in silhouette against the sky, and from some distance below, and in a complex design the mitres and turns of the cornice or cap tended to exaggerate all the projecting parts. Here is a case for observation and measurement of good existing examples, to find out from actual facts how certain effects are produced. Opportunities are within reach of everyone who essays that which is, to my mind, one of the most difficult features to design successfully.

[Mr. Cave here showed slides of chimneys at Clifford's Hall, Hampton Court, and Horham Hall. Also of fireplaces by Mr. E. L. Lutyens at Danesfield, and finally of Westminster Cathedral.]

I should like to draw your attention to two modern London buildings which are both remarkable, though in an entirely different manner, for their use of brickwork.

All Saints, Margaret Street, is an example of the use of coloured brickwork, which for dignity and fine sense of proportion is difficult to equal. The late William Butterfield was a pioneer in the second half of the last century in the use of brickwork, and Keble College at Oxford will remain as a lasting memorial to his love of this material. Doubtless there are many who can see little in this College except the stripes and diapers of many colours and design, but those who can look beyond these effects—which I grant are not always satisfactory—must acknowledge a master hand in the general design and proportion. It has been said that if Keble College was whitewashed all over it would be magnificent.

I mention the Roman Catholic Cathedral at Westminster. The exterior is familiar to most of us, and shows an ingenuity of design which is characteristic of its designer. The late Mr. Bentley was an artist in the finest sense of the word, and his daring use of brickwork on a vast scale has given us the most remarkable London building of our generation. The illustration shows the great brick arches of the interior in their naked simplicity and dignity. It is, I understand, intended to cover them and the concrete vaults with mosaic and marble, so it is perhaps straining the point to allude to this interior brickwork as it now stands. But I think it will be acknowledged that as a mass it has great repose and is full of imagination, and is a fair answer to the statement that it is impossible to reach sublimity in brickwork.

To sum up the main points of this very interesting subject, we have seen from the illustrations of the fine old English brickwork that there was a great tradition not tied or fettered by any strict rules, but which bears its mark and individuality and gives us pleasure to-day, compared with the ordinary red brick wall of the suburban villa. Time and weather are no doubt largely responsible for these delightful effects in the old work, but the villa wall will never look right as long as it lasts, quite apart from the question of colour. The even machine-made bricks, with the narrow ill-struck joint, will damn it to the end.

This brings me back to the point where I started. Let us learn all we can from the masters in the past, who must have enjoyed their building and knew how to handle their material. Then let us start out on our own path, fortified with the beauty and charm which we find in their use of the material, and see if we cannot carry the great traditions one step further and leave behind us something that will give pleasure to the generations yet to come.

MANCHESTER SOCIETY OF ARCHITECTS.

At a meeting of the above Society, on February 23, Mr. Ronald P. Jones gave a lecture on "Sicily." The two great architectural epochs of Sicily, that of the Dorian civilisation of the fifth century B.C., and the Norman of the twelfth century A.D. were illustrated by excellent slides.

In the course of his remarks the lecturer said that architects are too apt to regard Greek architecture as a matter of modules and profiles, to study it in the adequate line

diagrams of the text book. Construction, materials and building methods are frequently ignored, and the buildings are generally studied in parts rather than as a whole. Consequently the variety of the actual work is seldom realised. We are too apt to gauge Greek architecture only by the Athenian masterpieces.

The Sicilian colonists represented specially adventurous and vigorous members of the mother community, and founded cities far more populous and magnificent than those of their birth.

The Temple of Segesta forms a good introduction to the study of Sicilian architecture. Its splendid isolation among the limestone hills, its restrained and reposeful style, provide an extraordinary instance of a weight of effect obtained by simple means. Here we find imposing scale and sombre magnificence, where all the refinements of detail are absent. It has come down to us as it left the hands of the builders, perfectly preserved, but still unfinished, for the building operations were rudely interrupted by invasion in 409 B.C. This being so, it forms one of the most lucid illustrations of Greek methods of building. The peristyle was built before the cella, and the flutes were added after the erection of the drums.

The rough local limestone, of which the Sicilian temples were built, was faced with a film of marble stucco, in which the mouldings and refinements were worked. This fine surface was polished and coloured. The Greeks had not the modern appreciation for the beauty of material in itself, just as they had not our love of natural landscape. To them, Pentelic marble was the best building material available, ensuring the highest possible finish. In Greece and Sicily the blaze of pure white marble is too dazzling, and the subtleties of form and light and shade cannot be appreciated unless the material is toned down with colour. The Greeks aimed at the highest possible finish, and looked upon joints as evils to be concealed by every possible means. Accordingly, in Sicily, by veneering the rough porous material, the difficulty of jointing was eliminated and a monolithic appearance obtained. In order to understand these Sicilian temples we must visualise their gay and decorative effect, their veritable blaze of colour, set among luxuriant groves.

The remains at Girgente are placed in surroundings less tragic and isolated than those of Segesta. One of the largest and most luxurious of the city-states of the ancient world, Girgente, with its population of 400,000 inhabitants, exceeded even Athens itself in scale and magnificence. The traveller approaching from the sea beheld a group of buildings of almost unparalleled splendour. Seven great temples crown a long narrow ridge of rock $1\frac{1}{2}$ miles in length and 300 feet above the plain. The Greeks took advantage of the natural site and did not level the rock, as the Romans would have done. The great building period was from 480 to 410 B.C. In the Temple of Concord we have one of the best preserved of Greek buildings, in that of Zeus the most colossal and one of the few failures, the scale being beyond the possibility of the style.

Slides were shown of Syracuse and Taormina with its unrivalled view, and the lecturer then passed on to Palermo and contrasted the internal magnificence of the mixed style of the twelfth century, as seen in the Capella Palatina and Monreale, with the external architecture of the earlier Greek civilisation. The beauty of these mosaics, with their wealth and colour and logical treatment, is unsurpassed.

Those who have not been to Sicily cannot realise its charm. To one who has been there, the name of Sicily has an attraction before which even Italy must take second place.

Messrs. Dunkerley, Healey, Corbett, Professor Capper, and the president, Mr. Percy Worthington, took part in the discussion which followed.

ROYAL ACADEMY LECTURES ON ARCHITECTURE.

THE second lecture by Mr. Reginald Blomfield, A.R.A., in his course of four, was delivered at the Royal Academy on Thursday, February 23. It dealt with "French architecture of the sixteenth century."

Henri III., the last of the Valois, was assassinated in 1589, and the sixteenth century went out in France under conditions of desperate confusion and political stress. The last quarter of the century had, said Mr. Blomfield, been almost a blank in architecture. Then set in a period of slackness, in which the brilliant traditions of the third quarter of the sixteenth century were lost. In fact, what may be called the second lap of the neo-Classical manner in France

was closed by the death of Henri III. The first period, which opened with the arrival of the Italian artists early in the sixteenth century, ended to all intents and purposes with the death of Francois I. That king, in spite of all his appreciation for the arts, left things rather worse off than he found them. His was the age of the amateurs, and of the unchecked development of "bric-à-brac" art. With some inconsiderable exceptions it is impossible to trace any marked advance in house-planning in the first forty years of the sixteenth century. Two types of plan were in use; the courtyard plan and the plan "tout en masse," as Du Cerceau calls it, that is a block plan with a corridor down the centre. The first was the direct descendant of the enclosed fortress plan of the Middle Ages, the only development being that this was in certain cases regularised and rectangulated. As to the block plan, though modifications were introduced here and there, this form had been used in the fifteenth century. Of course most of the important building work consisted of large extensions and remodellings of older buildings. The chief effort of the designers was devoted less to the composition of the building as a whole than to its ornament. In this latter regard there was a distinct falling off at the end of the reign of Francois I. from the standard introduced by the Italians. From the first these skilful artists had been regarded with jealousy by the native workmen, and as the king's political embarrassments increased he was less able to protect the foreigners. French workmen took their place, and the first Italian tradition of pure ornament faded away.

With the accession of Henri II. begins the second chapter of the Renaissance in France. The King himself, fortunately for French architecture, cared nothing for building; but his mistress, Diane de Poitiers, cared a great deal. She made it a fashionable hobby, and there can be little doubt domestic architecture gained in the process. Moreover the King's personal indifference was the opportunity for his officials, and most especially for Philibert De l'Orme, the architect and surveyor of the Royal buildings. He at once made short work of the building contractors who had robbed the late King right and left and built detestably. He taught them, for good or bad, that a new era had set in, that their business was to take their orders from the trained architect and carry out his designs in an honest and tradesman-like fashion. The Guilds had also proved their corruptness by their incessant selfishness and rapacity. Moreover, the Renaissance meant the emancipation, even the assertion, of the individual paramount. A new class of men had just arisen in France, men who devoted themselves to the study of ancient architecture in order to be qualified to substitute for the crude efforts of the master-builders some more authentic version of neo-Classic. De l'Orme and Jean Bullant were studying the antiquities of Rome on the spot and, more important still, were getting into touch with the humanists of Rome.

The result when such men returned to France was very different from the rudimentary notions of Renaissance architecture which prevailed at the court of Francois I. De l'Orme's first design for St. Maur is a remarkable illustration of the advance in architectural sense. There is thus a definite separation between the Francois I. period and that which succeeded it and which closed with the death of Henri III. The advance made is considerable. In the first place the architect had firmly established his status as an artist in building, and, in the case of the King's architect, he was an high official. The conditions of practice were not far removed from those of the present day. The scope of the architect's work was defined for the first time, and his training became more thorough and systematic. However, neo-Classic was still immature in France, and not quite certain of its direction. Brilliant individual artists had each worked on their own, and so far they had not succeeded in forming a school or a permanent tradition. It took another three generations to build up a uniform standard and tradition of architecture.

Before the middle of the sixteenth century the irregular plan of the older houses had been reduced to ordered symmetry. In regard to internal arrangements the single thickness plan, that is, suites of rooms with a corridor on one side only remained the common practice, but the newel staircase was going out of fashion, greatly quickened when De l'Orme introduced his oval staircase at the Tuileries. Very large gardens were coming into fashion. French architects were, in fact, feeling their way to a national style, a manner which, though it started in Italy, became in the following century purely French.

The technical advance shown in elevations, that is in the realisation of plans, was more marked than in the art of planning itself. The motives of early Renaissance archi-

tecture in France were very limited and were lacking in breadth. Their whole idea was to break up the wall surface into strips and panels for the surface ornament. It was to the task of correcting these faults that the new men addressed themselves with enthusiasm. Perhaps not one of them had caught "the true Roman manner." They hardly realised the value of plain wall surfaces, or of the relations of great masses of buildings as essential elements of architectural design. But they greatly enlarged the vocabulary of architecture. The elements of future developments are to be found, not only in this real advance in technique, but in the fusion of the arts, the adjustment of relations which made it possible for the painter, the sculptor, and the architect to work successfully together. In the catastrophe of the civil wars the arts fell back again; but the labours of Goujon and De l'Orme and his contemporaries were not wholly in vain, and when order was re-established in France the tradition was resumed and the development of French architecture proceeded steadily on the lines laid down by these pioneers.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

A GENERAL meeting of the Society was held on Thursday, February 23, Mr. Sydney D. Kitson presiding. Mr. Harold Henderson, of York, read a paper on "Some Minor Domestic Architecture in Yorkshire." Confining his remarks to an analysis of the composition and detail of the buildings of the Dalesmen, Mr. Henderson said that these Yorkshire homesteads bore probably to a greater extent than in any other district in England, the impress of the individual, the strenuous and unbending character of a race who lived in a generation of fierce and strict Puritanism. The houses were sturdy and strong, standing four square to the weather, perhaps in some cases grim and stern, testifying to the reserve of their owners in high unbroken walls, yet displaying nevertheless in occasional grotesque or quaint finial a dry wit as a tonic and saving grace.

The great majority of the houses were of the seventeenth century, owing to the great number of gentry who lived on the produce of the land at that time.

The characteristic features peculiar to these Yorkshire buildings were dealt with in detail in the description of a typical house with single span roof, an occasional gable ornamented by finials, a projecting porch with quaint doorway, and fully illustrated by a series of studies and sketches, by Mr. Henderson.

At the close a hearty vote of thanks was proposed by Mr. C. B. Howdill, A.R.I.B.A., and seconded by Mr. R. W. Thorp, A.R.I.B.A. Briefly responding, Mr. Henderson urged the closer study of the type of building of which he had spoken, to the end of reviving the Yorkshire domestic traditional influence, now unfortunately almost extinct.

The next meeting will be held on Thursday, March 9, when Mr. W. H. Ward, A.R.I.B.A., will read a paper on "French Renaissance Church Architecture during the sixteenth century."

ILLUSTRATIONS.

CROOKSBURY HURST, NEAR FARNHAM.

THIS house stands high in a pine wood under Crooksbury Hill, and was built for Mr. W. H. Woodward, from the designs of Professor F. M. Simpson, F.R.I.B.A. The ground falls rapidly to the south and west, necessitating different levels for floors. Symmetry, however, has been obtained in the plan, and the main cornice outside is continuous. The principal room is the library. A feature is the outside loggia, approached from the drawing room by a corridor. The billiard room is not yet built. The builders were Messrs. Tompsett & Co., of Farnham. The bricks and tiles were supplied by Messrs. Thos. Lawrence & Sons, Bracknell, Berks.

WESLEYAN CHURCH, MELLISH ROAD, WALSALL.

THIS church was recently erected at a cost of 4,000l. The seating capacity is 400, thus making the cost 10l. per sitting. The whole of the work is excellently finished, the joinery is executed in oak, and the church is built with stone from the Weldon quarries. The roof is covered with Westmoreland green slates. The builders were Messrs. Streather & Hill, of Four Oaks, Warwickshire, and the architects Messrs. J. H. Hickton & H. E. Farmer, F.F.R.I.B.A., of Walsall and Birmingham.

OXFORD COLLEGE SERIES.—CHRIST CHURCH.

CONTINUING our series of views of Christ Church College, we this week give illustrations of the Staircase and Tom Tower.

THAT BRICK IS EMINENTLY SUITABLE FOR LARGE TOWN BUILDINGS.*

(Concluded from last week.)

YOU will remember that I wished to consider the brick under two aspects, its primary and its secondary qualities. Let us take the primary qualities first, and deal with the brick in what I have called its passive voice, its power of resisting outside attack.

"Architecture aims at eternity," writes Sir Christopher Wren; and if this is so, the primary qualities of the material are important. It may, of course, be objected that the essence of a modern town is its fluidity, the ebb and flow which leaves the riverside mansion of one generation among the factories and warehouses of the next, as in Bermondsey. But the rise of definite schemes of town planning will to some extent obviate this, and in any case we can hardly hope for a worthy town architecture if we deprive the architect of the incentive of futurity and deliberately expect our banks and schools, our fire-stations and town halls, to moulder away in half a century.

We have, then, from the point of view of permanence, to compare brick with other materials. And here I should feel justified, on the authority of Palladio and Mr. Blomfield, in considering terra-cotta as brick. "Stones are either natural," says the former, "or artificially made by the art of man. The stones artificially made are commonly called bricks." Moreover, terra-cotta has the alumina, silica, lime, and magnesia which are characteristic of brick, and in much the same proportions.

We have, then, to compare the weathering properties of these artificial stones with the three other available materials, stone, concrete, and steel.

Of these, exposed concrete would not withstand the action of frost, and exposed steelwork would have to be protected from the weather. And both these materials conduct noise and changes of temperature too easily to be by themselves a good material for town building. We seem to be reduced in any case to a comparison of the merits of brick and stone.

Building stone is of three main classes—the igneous stone (such as granite), sandstone, and limestone; the agencies of disintegration are, broadly, two, chemical and mechanical. For the following summary of the agencies attacking building stones in towns I am indebted to Mr. Allen Howe's recently-published "Geology of Building Stones."

Chemical Agencies.—Ordinary rain-water, owing to the presence of carbon dioxide, can affect the felspar of granite and the calcium of limestones. Of itself this action is slight, amounting to less than a millimetre in a century. But when rain falls through air which is loaded daily with 980,000 lb. of sulphur it is as if we were to syringe our buildings with sulphuric acid. Snow carries a higher percentage of injurious substances than rain-water. And the unburnt carbon particles from our coal fires act again as distributing agents of corrosive acids.

Mechanical Agencies.—Among these must be numbered organic deposits, either decaying organic matter in the form of blown dust or living organisms, lichens, and so forth.

Wind and friction are two other mechanical agents; but the most important is change of temperature. This particularly attacks the crystalline stones. In typical desert regions the crackling of rocks in the cold nights which follow the hot days is a familiar sound. The tendency of large towns is to lessen extremes of heat and cold; but we have not yet banished frost. And the expansive power of water freezing in a confined space amounts to a pressure of 138 tons per square foot.

How do the various building stones stand these agents of destruction?

1. **Limestone.**—The bed of rock which lies in a great bow across England from the Humber to Portland Bill is the cradle of most of our great public buildings. From a chemical point of view all building limestones are identical. Their content of carbonate of lime should be so high that almost all other substances may be regarded as impurities. And it is the carbonate of lime which decays under atmospheric acid; while the more crystalline limestones cannot withstand frost.

2. **Sandstones.**—Sandstones are attacked in the cementing matrix, which is either of a clay or a lime nature. And another disadvantage of sandstone is its uncertainty. Corsehill stone, for example, may be seen perfectly preserved in many cities, yet there are many instances where small balusters have decayed, and where it has been used on end as a facing it has scaled badly.

3. **Igneous Rocks.**—These, if fresh, are hardly liable to chemical decay. But they yield readily to the mechanical action of frost. Cleopatra's Needle, which could keep the sharpness of its inscriptions for 2,000 years in Egypt, has had to be treated with preservatives.

All around us is decay. By a curious irony the walls of St. Paul's, which were built out of a coal-tax, are now in their turn paying toll of their substance to coal smoke. London is mouldering away. And not London alone. The Clarendon Buildings at Oxford and the St. Aldate's face of Christ Church have been rebuilt in the last four years. And the air of Manchester contains twice as much acid as that of London. Nor is the disintegration solely due to coal smoke. Sir C. Wren tells us that even in his day the walls of Westminster Abbey were taking water, "which being frozen scales off." There is perhaps now not a stone of the Abbey which is as old as the day it was built. And you cannot rebuild a masterpiece, even piece by piece, without making the whole hard and self-conscious.

And yet there is to our hand a material which can be made impervious to frost and to atmosphere. "The earth about London," Wren says in a letter to a friend who was on Queen Anne's Commission for the Building of Fifty New London Churches—"the earth about London, rightly managed, will yield as good a brick as were the Roman bricks, and will endure in our air beyond any stone our island affords."

But endurance is not all we are looking for; though we had to our hand the adamant of Hades, we should not unhesitatingly build our towns with it. We have been examining the body; you will not feel that I have tackled this subject adequately unless we also examine the soul. And this is certainly the essence of the matter: how far does material affect the building's appeal to the heart? And what qualities are peculiar to brick or to stone?

I only wish that I were more equipped for dealing with so interesting and vital a matter. I must hope that the discussion will throw more light on it.

The question before us is how far brick is a suitable material for large town buildings. And we have seen that this practically resolves itself into a question, so far as surface matter is concerned, between brick and stone. The use of concrete or of steel exposed is not general enough to warrant serious examination, though I may perhaps in passing quote from Mr. Fergusson's "History of Modern Architecture" the passage where he is discussing the newly-built Crystal Palace. "Though stone," he says, "may be inappropriate, brick and terra-cotta may be employed with iron and glass with the very best effect. When so used the brickwork must be of the very best quality, so as to be pleasing in itself. Coloured bricks should be employed everywhere to give relief and lightness."

It is, then, a question between brick and stone. Let us take a brief survey of stone as a material of design.

There are two ways to build with stone. The one is to build with small stones, as did the mediæval builders; the other is to build with the largest stones we can get, as did the Mediterranean civilisations, whose heirs we are. Of these, the former almost merges into brickwork; indeed, many of the Gothic revivalists acknowledged this by their work, as may be seen in a walk round the London churches built by Street, Pearson, or Butterfield. At the same time, such mediæval work has the essential difference of carved ornament where stone must be used. The ornament of brickwork is either moulded or a patterned arrangement of bricks. This, I think, is essentially so. The fourteenth century innocence which chisels the brick niches of Beverley Bar, no less than the delicate Renaissance skill which carves the Cupids' heads in the rubbed brickwork of the Enfield House (now in the Victoria and Albert Museum), emphasises the truth that carving should be on stone. I am inclined to think that this mediæval method of building with small stones is the only logical method to-day.

But, certainly, it is not the method we have chosen. We rather go for our architectural forms to those dead civilisations whose resources and whose ideals were so different from ours, to Athens, who could quarry her temples from Pentelcus, or to Rome, whose building materials were the spoils of a world. Bramante can find cornice stones (a little small, it is true) for his portico at St. Peter's, with its 9-feet diameter columns. Wren is long delayed for the cornice to his order, which is less than half the size. And, as a result, we use a form of building where the whole system of the proportions is based on the size of the stone for cornice and lintel, while we vitiate that form by stringing small stones across the lintel, or building up our columns of discs, like so many draughtsmen, as in the Madeleine at Paris.

* A paper read at the last meeting of the Architectural Association.

But there are many to whom the abstract logic of design will not appeal. To them I would suggest that our use of Roman and Greek mouldings is hardly defensible. We use shapes that were designed to give an effect of glowing depth or stark delicacy under a searching sun; and we deliver them over to our weather, to wash them unevenly with its rain, to scour them unevenly with its south-west wind, to paint them unevenly with the velvet black of its carbon. If we are going to build in stone, ought we not to take account of all this, to arrange our angles and to design our mouldings so that the rain and wind may burnish those parts which we want white, and the smoke paint here and there a darkness which no Greek temple could attain? This would ask an amount of logical thought and experimental study, and perhaps the result would be theatrical. At least it would only be suited to something monumental, some great tomb or bridge or gateway.

But we live in an equable and kindly, rather than a monumental age. What are the large buildings we build in towns? Not a Pantheon, rarely a cathedral; even Newgate Prison is gone. For us, large town buildings are offices and banks, flats and elementary schools, theatres and fire-stations, town halls and public libraries. It is the immensity of our towns that is monumental. No one can have looked down unmoved upon Birmingham from the G.W.R. embankment. And I feel strongly that the note we have to strike is not a note of art and grandeur. We live in our great modern cities as our ancestors lived in the great forests. I think you cannot walk down Tooley Street or look over the endless roofs of Tottenham without feeling rather frightened. Our cities are great. Cannot we make them less terrible? There is a gracious homeliness about brickwork—what Charles Lamb calls “a cheerful, liberal look.” We feel it in the Temple, in Gray’s Inn, in Westminster. For my part I should be less frightened of calling on the King in St. James’s than in Buckingham Palace. Who does not long more than ever now to be a fireman, to live in those pleasant brick fire-stations? St. Benet’s, in Threadneedle Street, would stay my Sunday morning steps rather than St. Mary-le-Bow.

For our theatres and palaces of commerce we may use glazed bricks, beautiful as a De Morgan tile, and imperishable; probity is to be found in small things, and I would distrust a firm that hangs a porphyry lintel to a rolled steel joist. We may use salted bricks, or rubbed bricks, which laugh at acids; we may fill our palette with red from Fareham, with blue from Staffordshire, with white from Suffolk, or with the rose and purple of the weathered London stock. Texture, no less than colour, is ours. With glazed bricks and rubbed bricks, with recessed joints and lime cream, and with all the varieties of bond, what may a clever man not achieve?

It is then on these grounds that I base the claim of brickwork in town building. Historically we see that the great building ages have not disdained it; that, moreover, it is essentially an English material in that it was being used most surely and most vividly just when the English genius, cut off from Italy, France, and Spain, was most surely itself. Chemically, we see that we can by processes of manufacture, by selection of material, by careful burning, perhaps by glazing, produce something more enduring than Nature gives us. Most important of all, brickwork, in the hand of a master, may have a serenity and a kindliness which our great towns so conspicuously lack. We are building for the future; but we still have our roots in the past.

Mr. Wells prophesies that we shall live as intellectual insects amid an intricacy of glass and steel. On a large view I wonder how far it is sound for man to project such a shadow of himself on the screen of the future. I believe the man of the thirtieth century will have less in common with this anæmic abstraction than he has with Dickens or Herodotus; that he would rather walk with Charles Lamb to the Old South Sea House or the Temple than aviate with Mr. Wells amid the colossal perfection of some newer New York.

Mr. ALAN SNOW opened the discussion as follows:—Mr. Newton very modestly disclaimed expert knowledge upon the subject of brickwork, and then proceeded to show us what a lot he really knew about it. If he is not an expert, certainly I cannot be, and I imagine the reason for my opening the debate to be that, having myself proposed the subject, it was thought probable that I had strong opinions upon it. My suggestion contained one slight difference; I said eminently unsuitable.

Before seeing Mr. Newton’s paper I had written that to really approach a settlement we require to bear in mind (1) the nature of large town buildings and their necessary architectural character, and (2) the qualities, defects, and limitations of brickwork. These are much the same as Mr. Newton’s two premises, but there is this difference: it seems that he

would determine the material and then his effects, whilst I argue that the opposite course is here the proper one.

He himself half acknowledges that brick is not eminently suitable when he says he is inclined to think building with small stones is the only logical method to-day. If we ignore ferro-concrete—which I am not agreed we can do—I think he is right, and certainly agree with him that our use of Greek and Roman mouldings is hardly defensible. It is not defensible if they really are Greek and Roman, but I do not see why we should not be able to adapt the ideas which these mouldings clothed, and I do not see any argument here for the use of brickwork. To quote him again, he says: “It is the immensity of our towns that is monumental. Our cities are great. Cannot we make them less terrible?” Well, I think we could, if we did not use so much brickwork. I do not see how immensity and the gracious homeliness to which he refers can go together. Huge cities are huge mistakes, but we must now accept them as necessary evils, and do our best with them.

The architectural world is now practically agreed that geometrical planning is desirable in large towns. This, with its angles, long lines and curves, requires geometrical elevations, depending for their effect upon continuous horizontal lines, such as string-courses, cornices, &c., perhaps varied, but to a very limited extent, by gables, or a small group of vertical lines. This cannot be so well done in brick that it cannot be better done in stone or some other material.

It is not possible in brickwork to ensure that these lines shall be strongly enough marked, sharply enough defined; they lose themselves too soon in the distance. Neither is it possible to give to the projections the boldness, and to the enrichments the clear cut expression that is necessary for the attainment of true dignity and beauty.

Who will dare assert that the intended purpose and effect of a cornice or string course is as well realised in brick as in stone? Does anyone really hope to obtain the beautiful effects of a long length of curved moulding when he must construct even its simple curve in two or three horizontal divisions, or else make it so small as to be without effect? Are such shapes, indeed, natural to brick at all? If we adopt it as our material, are we not, at the very beginning of our building, confessing that it is unsuitable by embellishing it with forms evolved in another and larger material? The small unit it is that wars against the desired effect of mass and dignity; it is out of scale, and is only successfully used in subordinate positions; in buildings where the principal lines and effects are due to the use of stonework or some other material.

Suppose, then, we do without these foreign forms. Suppose we build our town building six or seven storeys high and several hundred feet long, entirely and naturally of brick. What is it going to look like? What is going to happen to it? Perhaps we may rely on texture and beautiful colour. Warmth of colour and variety of texture are the distinctive qualities of good brickwork, but these same qualities, which are amongst the chief reasons for the revival of brickbuilding in our country work cannot be relied upon in our large towns. The brick is either a hard and repellent material or its surface makes of it a natural collector of soot and dust, which are inevitably present in all large towns, and which adhere to the brickwork and in time become ingrained in it, and our once beautiful piece of colour becomes dull and of a drab monotony. Myself, I have never noticed the rose and purple of the weathered London stock that Mr. Newton mentions.

Also, these effects of colour and texture are ones that can be only appreciated when within the natural range of the eye. The old brick buildings of which we are so fond are seldom more than three storeys high. The chambers of Gray’s Inn and the Temple cannot be likened to the modern block of flats or offices. Who will say that these huge blocks of brickwork give the same pleasure as the earlier ones, even though treated in precisely the same manner and with as good materials? Perhaps we may go further than to simply rely on colour and texture, and aim at obtaining effect by pilaster or panel treatment, but can one finish this at the top in a satisfactory manner? And what is one really aiming at? Effects of line, obtained by shadows cast by one plane upon another, and here, just as with the horizontal lines, the material will prevent one from really gaining one’s end. One cannot get the lines sufficiently defined owing to the joints, and, worse still, the shadows are dulled and spoilt. Here we come up against one of the chief objections to the use of bricks in towns. The dull surface to which they so rapidly attain is incapable of reflecting light, and, indeed, may be said to absorb it. No brick building could ever sparkle as does the spire of St. Martin’s-in-the-Fields, seen

from the bottom of Whitehall. Our towns, being the dull places they are, and our streets of lofty buildings excluding all the light they do, this is a very serious defect.

If I were to ask you to imagine St. Paul's Cathedral or the British Museum in brick, you would think, perhaps, I was rather stretching the point, but why should you? If brick is unsuitable for these, is it any more suitable for the far longer and less broken frontages of our streets, where we cannot get relief by recessing portions and the provision of cornices, pediments, &c.?

Call to mind some of our streets of brick, and say if you admire them. Think of Victoria Street, Harley Street, Tottenham Court Road, and innumerable streets in Bloomsbury and Kensington, but collectively what poor, dull streets they form. Which are preferable, the stone or the brick buildings of London, or Liverpool, or Berlin, or any other large town? To take actual examples, which do you think finest, which most suitably expresses the dignity of a great city? The embankment front of the Hotel Cecil, or Whitehall Court; the new Admiralty or the Horse Guards; the Houses of Parliament or St. Pancras Hotel; St. Albans Abbey tower, which Mr. Newton mentions, or the Angel Steeple at Canterbury? We might extend the list *ad infinitum*.

Brick, in fact, has proved unsuitable in every way in these large town buildings. It has become dirty, losing colour and light, and the size of the brick, a dimension far too familiar to all the world, is quite out of scale with the size of the building. Large town architecture requires a larger treatment than brick will allow of; the best possible effect must be aimed at, and will not be obtained by the use of brick. Large masses of brick in a town become dull and monotonous, and we cannot give the brickwork that natural setting of green trees and blue sky, against which it looks so fascinating in the country. It is so much a natural material that it requires a natural setting. This age and this country are almost alone in the large use of brick. Mr. Newton tells us that the Greeks concealed their brickwork, and although at first thought one might urge the Roman and Byzantine buildings as examples of large town work in brick, they are not really so. The Roman brick is probably much more familiar to the modern country parson than it ever was to the citizen of ancient Rome. Both peoples used it in their largest buildings, but always concealed it, and the Byzantines evidently did this in recognition of the fact that in them brick was an unsuitable material, at any rate for display, for in their smaller buildings they used it deliberately, obtaining effects with it which were charming, but necessarily small in scale and design, and inapplicable to large building schemes.

Something of the same recognition of the charm of brick in small work, and its unsuitability to large work, appears in the buildings of our eighteenth century forefathers, who knew certainly as much as we do about town architecture, and never used brick in important streets without disguising it. The French and the Americans, who know more than we do about that subject, hardly, if ever, use brick. We find ourselves again in that insular position so peculiar to ourselves, contentedly persisting in practices long ago dropped by the rest of the world. Where, you may ask, come in the familiar Georgian buildings, old and new, which we all admire so much? Well, I consider them as eternal proof that brick is not suitable, for are not all the effects which combine to make up their charm obtained with other materials? Is it not with the stone or wood cornices or quoins, windows and doors of painted wood or iron? This use of other materials is but an honest confession of inability to achieve a completely satisfactory result with the bricks that form the greater part of the walls. Again, the picturesque gabled outline one associates with so many brick buildings is not peculiar to them, and can be done just as well in stone.

Regarding the matter from a purely constructional standpoint, one cannot ignore ferro-concrete; it is just the material for the kind of building that Mr. Newton instances as the typical large town building, with its many openings, few supports, and demand for unencumbered floor space. It is only in our own benighted country that it is set apart for special occasions; abroad, in the land of its invention, it is used in large work and small, town and country.

To conclude, I maintain that brick is not an eminently suitable material for large town buildings, because with it the necessary and proper effects for town architecture cannot be achieved; because it does not retain its inherent aesthetic qualities, and acquires no others; and because it is possible to construct as efficiently, and often more efficiently, with other materials.

Mr. H. FRANK MURRELL thought that Mr. Newton would have done better if he had considered brick as a fair material. The appeal for its support had been based on

three grounds, viz., history, science, and the artistic sense. The reference to history seemed unfortunate. For instance, the Greeks covered their bricks with stucco, and the Romans with concrete. On the other hand, in support of the argument, there were Byzantine buildings and those of northern Italy; or in this country there was the wonderful group of brick buildings in Essex. Mr. Newton had completely ignored the question of matrix, which in normal brickwork amounts to one-fifth and in stonework to one-hundredth of the surface. Nor did he say how he would construct his joints. A most happy instance of gauged brickwork was the old section of the Victoria and Albert Museum. As to the appeal to science, it should be remembered that dilapidations, raking out and repointing, were hard to avoid in brickwork. Finally he appealed to the artistic sense. Wren in Hampton Court realised that the King's palace was also the King's home. The feeling of homeliness is emphasised by brickwork; and it is not such a quality as that which is wanted for large town buildings.

Mr. G. FILDES suggested that when Wren built Chelsea Hospital of brickwork he probably had no aesthetic consideration in his mind, but did so solely for economic reasons. The suitability of brick as a material had just been disparaged on the ground that the inevitable repointing was scarcely a dignified process. But cutting out portions of ashlar which have shaled (as in the Horse Guards or the buildings of Oxford) was no less objectionable. The later Roman basilicas supported the contention that brickwork was suitable for town buildings. Mr. Newton had substantially proved his points. The arguments against his proposition were neither very telling nor very weighty.

Mr. HERBERT HALL thought that the arguments put forward by Mr. Newton had been spoilt by his last paragraph, to the effect that brickwork imparted an air of serenity and kindliness. Such qualities were not wanted in city architecture. There was about brickwork a suggestion of charm and gentleness which was unnecessary in large town buildings. It appeared to him that no architect had a right to use stone unless he had a very good design. If the much-talked-of Minister of Fine Arts was ever to come to life he ought to have the power of settling the material in which a design should be executed. The product of the quarries of Portland ought not to be squandered on inferior buildings as they are now. Consequently when one came across a brick building in a fine street like Kingsway, one would know that the architect was in disgrace. There seemed to be something very unpleasant about "the thoroughly reliable brick" which commercial travellers brought to one's office. It appeared only too true that nothing would ever destroy it, and that the brick would be precisely the same two hundred years hence. The brick that architects liked was affected by time. In designing buildings for the country the architect found himself, so to speak, over-ridden by nature. For a house in a beautiful site, whether in a picturesque village, in a wood or on a hill, stone seemed too pompous a material, for it asserted its individuality in a way it had no right to do. But in a city building nature is driven away, the architect has no such restraint, and he can assert himself by using the best material obtainable. In the country there seemed a need for something less imperious than brick. The practice of introducing narrow brick lines on a stonework front gave a sort of weakness of effect. Whenever one wished to express oneself on a top note, so to speak, one should use stone; whenever it was necessary to suppress one's individuality brick was the best material.

Mr. D. A. FORSTER disagreed with the suggestion that boldness was impossible in brickwork, and he instanced the Prudential Buildings in Holborn. One point in favour of brick had not been mentioned, viz., its incomparable fire-proof qualities. It was a slander to hold up brick as an abnormal collector of dirt. Stone was as bad in that respect, as was evidenced by the British Museum and St. George's Hall, Liverpool.

Mr. ARTHUR KEEN, in closing the discussion, took exception to one or two points made in Mr. Newton's paper, as, for instance, the claim to consider terra cotta as brickwork. The initial resemblance of the two, he said, quickly ceases. In architectural treatment terra cotta is used more like stone than brick, being employed in large lumps. He also dissented from the suggestion that it was not until the seventeenth century that brick was regarded in England from the point of view of its colour and texture. Brickwork was never prepared to receive a plaster coat, and the architecture of cities depends for effect on such things as are impossible in brick-

work. Some of the most charming effects of St. Paul's and other town buildings are traceable to the accidental effects of weather and smoke. Half the effect of Portland stone is the intense black contrasted with the vivid white where the soot, &c., has not been washed away. Wren's two or three brick churches were not exactly treated architecturally—St. Benet's and St. Mary Abchurch, for example. There is, of course, dignity to be got out of brick, but not in the same way as stone, which, as the handsomer material, seems best fitted for towns. Moreover, the necessities of design in town buildings render brick unsuitable.

Mr. NEWTON, in replying to the points raised, asked why, if accidental effects were so important, did they not so arrange their mouldings and projections that the weather would do precisely what was desired. In conclusion, he said that the historical claim for brick was that it had been used by the great building ages of the past—though this did not mean that it must still be employed in precisely the same way. Its economic claim was that it is more impervious to the atmosphere than any other material. And finally its artistic claim was that it is capable of introducing that note of serenity and kindness in towns already monumental enough in size.

FREDERIC SHIELDS.

[BY A CORRESPONDENT.]

ON Sunday night death came to release Frederic J. Shields from a life which had had an over-brimming measure of pain, sorrow, and disappointment. From the time of his birth in Hartlepool, some seventy years ago, until the day of his death, at "Morayfield," Merton Park, a series of trials have succeeded one another with painful insistency. But up to the end his spirit was unbroken and his trustful confidence in the Supreme Will remained undiminished.

The story of his career is that of a brave man struggling with adversity. But in his case the final triumph of failure could scarcely be said to have been completely attained. He was born of humble parents, and received a rudimentary education in London, at the Charity School of St. Clement Danes. At an early age he showed signs of having inherited such artistic instincts as had not been eradicated from his father's nature by a suspicious Scotch mother and unremitting toil as a book-binder's finisher. As a small boy he would play truant in order to hide in a garret at his lodgings, where amongst the rubbish were some old prints of antique statues. These, he tells us, he would copy with trembling delight while daylight lasted. The same earnestness sent him to the British Museum to make untutored drawings direct from the antique. When fourteen he had to join in the stern battle for daily bread. For the next three or four years he worked for various lithographers. This distasteful drudgery was broken by a firm of Manchester printers dismissing him for incompetency. Of his next three employers, two died and one became bankrupt shortly after his joining the firm.

Shields next gained a somewhat precarious livelihood as an artist. But his work was chiefly for lithographic firms, varied by the production of a few water-colour subjects. In 1860 his position became less insecure, and he began to illustrate books. Five years later his water-colours won for him admittance into the ranks of the Old Water-Colour Society. When he finally left Manchester for London, in 1874, he had earned sufficient reputation for an exhibition to be held there of his works and a public dinner to be given to him.

To the friendship of Mr. Alfred Waterhouse, R.A., Mr. Shields owed much. It was through that architect that he received a commission from the Duke of Westminster to design the stained glass and mosaics in the chapel at Eaton Hall. The work was begun in 1880 and continued till 1890. It was followed by a much greater task, and one which was to monopolise the remainder of his life.

Shields, through Dante Gabriel Rossetti, had become friendly with Lady Mount Temple, and she in her turn brought Mrs. Russell Gurney, widow of a Recorder of London, to the painter's studio. The latter lady had been deeply impressed some years before by a small chapel in Florence, where no services were held, but which was always open for prayer and meditation. Mrs. Gurney became filled with a desire to set down a somewhat similar resting-place in some great highway of London or other large city. The walls of the outer court of her imaginary haven were, she says, haply painted with deeds of brotherly kindness. After many discouragements authority was obtained in 1890 to

erect a new building on the site of the disused mortuary chapel of the old cemetery on the Bayswater Road, W. Plans were prepared by Mr. Herbert P. Horne, the architect, writer, and connoisseur, who visited some of the northern Italian cities as a preliminary, paying particular attention to the principal church of Pietro Santa, in the Carrara district.

The controlling feature of the design for the chapel of the Ascension was the necessity to provide unbroken spaces for Mr. Shields' wall paintings. To this everything had to be made subservient. Moreover the difficulties of the site were great, for the old chapel on one side and the caretaker's dwelling on the other had to be left untouched. The aisleless chapel is long and narrow, principally lighted from windows near the roof. It is entered through a considerable porch or ante-chapel. The entire surface of the interior is covered with the paintings which represent twenty-one years' unremitting toil and study by Mr. Shields. The east or end wall has for its principal subject the Passion, Resurrection, and Ascension. On the north wall the figures of the Apostles are alternated by subjects taken from the Gospels; and on the south wall the figures of the Prophets are alternated by incidents taken from the Acts of the Apostles. The whole design was intended to express the eternal purpose of God's redeeming love, developing through successive dispensations—Patriarchal, Mosaic and Christian. Mr. Shields, in his handbook on the chapel, says that in consultation with the architect and Mr. W. H. Burke he decided to rivet blocks of slate to the wall, leaving an air-chamber behind, and then to affix his oil-paintings to the slate with a composition of white lead, &c.

The completion of this great undertaking has coincided with the artist's death, and he may well have sung "Nunc Dimittis" when the last panel was completed. Of late years Mr. Shields had been the victim of serious ill-health, and at times his work was executed in the greatest pain or had to be abandoned altogether. Indeed, it became a painful race between an iron will and approaching death. In a letter to the writer some eighteen months ago, he said: "I am trying, but feebly, to work—and that at tasks that demand all my old gone energy." A less invincible will would have given up the struggle or deputed the work to others. But Mr. Shields was of the stuff that heroes are made, and he overcame this last obstacle as he had overcome so many others. His nature was ill-suited to the rough and tumble of life. The slings and arrows of outrageous fortune that would have been unfelt by thicker skins cut him to the quick. His whole-hearted earnestness and his uncompromising single-mindedness made him seem when roused like some prophet new-inspired. Those who came into contact with him could not fail to be morally quickened by his loftiness of soul. For the past twenty years Mr. Shields had been saturating his whole being with the Scriptures, and out of that cleansing stream his spirit came purified and noble.

POMPEII: THE CITY OF THE DEAD.

AT Carpenters' Hall, London Wall, E.C., an interesting illustrated lecture was given on Feb. 23 by Mr. Whitworth Wallis, F.S.A., dealing with Pompeii. Mr. Wallis said that he was going to tell a fairy story of the pickaxe and the spade. The many opportunities and facilities afforded nowadays for visiting the ancient cities of Greece and Rome rendered the study of archaeology as interesting as it is important. Egypt and Greece and India were the fountain-heads of civilisation and the sources of our knowledge. To them is owed the origin of all that is ornamental in architecture. Their ruins fill the mind with wonder and astonishment. Few English-speaking people had not read with mingled pain and pleasure Bulwer Lytton's "Last Days of Pompeii"—that striking and graphic account of the Roman city which two thousand years ago was basking on the sunny shore of the Bay of Naples. The catastrophe alone kindles one's interests and excites one's sympathies, and those sympathies are redoubled on walking through the streets, looking at the temples or viewing the theatre. The power of looking into the future being denied to us, it is profitable to devote ourselves to the retrospect of the past and to study the wrecks of history.

One of the most fascinating of those wrecks known to us is Pompeii. Pompeii was founded six or seven hundred years before the birth of Christ. It became subservient to Rome at the time of the conquest of Campania by the Samnites. In 63 the city was visited by an earthquake and was more or less destroyed. Pompeii and Herculaneum had become by that time summer quarters for the aristocracy of

Rome. The inhabitants were consequently desirous of rendering the new town more worthy of imperial patronage, and they introduced the prevailing fashions of Rome. There are, therefore, various styles of architecture to be seen. The rebuilding can easily be traced. The hurried and careless manner in which the shattered buildings had been repaired, gaudy in colour, debased in form and in strange contrast to the architectural unity and chaste classicity of the older buildings, notably the Greek temple, which had been erected in a happier period of art. The columns, capitals, cornices, and minor details were covered with reliefs in stucco, impressed whilst wet with moulds—a cheap and easy way of producing effects—and these cornices, &c., were picked out with various colours strangely intermixed. The houses were built fantastically and gaudily decorated. Yet at times much of the decoration is marked by elegance of details and there and there a fine harmony of colour. But, added Mr. Wallis, the restorers of Pompeii of the first century before Christ were not one whit more objectionable than the church restorers of the nineteenth century of the Christian era in England.

It had been said that "the glory that was Greece was the glory of solid marble; the grandeur that was Rome over a core of adamant concrete." Pompeii was really stone, brick, and rubble cased in hard polished stucco. Though the rebuilding changed the general character of the city, the Romans could not, or at least did not, sweep away Greek art altogether, and they handed down to posterity an almost perfect Roman city of the time of Vespasian strongly marked in places with the last traces of the arts of polished Greece. The probable rebuilding must have lasted for some fourteen or fifteen years, though even by the time of the destruction in A.D. 79 alterations were continually taking place. At any rate, we have a town rebuilt between the earthquake of 63 A.D. and the eruption of Vesuvius—a period brought to a standstill on a November afternoon of 79.

The usually accepted date for this destruction is August 24. But there is a discrepancy among the manuscripts that have recently come to light. The clearings made have also pointed to a different date. For example, many specimens of fruit have been found like dried grapes and walnuts; besides wine jars upside down (being got ready for the new wine), and finally a very beautiful laurel tree that had reached maturity. It would appear as if the destruction took place on November 24 and not on August 24. In two or three days the ruins were covered with lava and ash, and the doomed city had entirely disappeared. No serious attempt was made to rebuild the little city, and Pompeii slept beneath the mulberry and the vine for nearly 1900 years. This sleep was broken in 1755 when systematic excavation on the site commenced. In 1863 Signor Fiorelli scientifically grappled with the problem. The excavations have ever since been carried out, declared Mr. Wallis, in a manner that must meet the approval of the most exacting of archaeologists. The depth of the soil varies; on the average it is from 11 ft. to 14 ft., though in one place there were 27 ft. of pumice stone. The earth and ashes are dug by boys with large broad spades and removed in trucks. There is much fascination in the work, no one ever knowing what the next spadeful may bring to light. When a piece of wall-painting is revealed the reds and blues and greens are as brilliant as if they had only just been executed.

With the exception of a few of the principal ones the streets were always narrow. The Street of Abundance, the widest, was only as wide as twenty-two feet. Innumerable fountains were everywhere. Names given to the houses frequently have reference to the objects found there or to a distinguished visitor present at the time of the excavation. Pompeii used to be a very busy place, and it was usual to cover exterior walls with advertisements, after the manner of the present-day billsticker. Between 500 and 1,000 of them have been brought to light. The most interesting refer to individuals standing as candidates for important offices and posts. These were the origin of the flaring placards which decorate and desecrate London at election times. One inscription was: "O, wall! I wonder you don't smash under the weight of this silly trash." Another inscription ran: "Stolen one jar; whoever brings it back will be well rewarded. If he brings the thief back he will receive double." Trade signs have been also found. All the shops were small; one young lady owned ninety of them.

Nowhere else can the domestic architecture of Rome be studied so well. To the exterior of the houses of Pompeii very little attention was paid; if the front was not let out for shops it was rudely coloured. The windows were small and filled in with talc and thick untransparent glass. The pictures of Sir Laurence Alma-Tadema brought home to one

what the interiors looked like. The walls were coated with a beautiful marble stucco on which the Greek artists executed their paintings. Floors were sometimes paved with marble, sometimes with cement and mosaic. Hanging lamps were used for lighting. The houses were entirely heated by braziers, not a single fireplace having been found.

Mr. Whitworth Wallis then proceeded to give details of various buildings such as the House of Cassius, the Villa of Diomedes, the House of the Faun and the House of the Military Governor. Probably the most magnificent yet unearthed is the House of Betius, on which work was commenced in 1898. When the authorities set to work they found it so full of treasures that they decided to leave the objects in situ instead of removing them to the Naples Museum. They have in this way presented an almost perfect house of the period. The House of the Golden Cupids is the last one to be cleared; it is a beautiful one, with many interesting wall-paintings.

Every great town possessed a forum. It originated at the intersection of four cross-roads and later became very much elaborated. At Pompeii it was the centre of business and of pleasure and was surrounded by the principal buildings. The centre was paved with marble. At its north end stood the Temple of Jupiter, a large building approached through a vestibule with six columns. The cella was beautifully decorated. On the western side are the remains of the Temple of Apollo. The courtyard is bounded on its three sides by a portico, having forty-eight columns painted in blue, yellow and white. At the time of disaster the figure of the god was wrenched away from its fastenings by thieves, who in endeavouring to escape broke off the legs, threw the body into a well, and sought refuge in a cellar with the legs. Their bodies were afterwards found. Though the worship of Isis was forbidden the cult was very fashionable. The small temple to this goddess was gorgeously decorated. At the back stood a large apartment in which were found many skeletons, presumably of the priests who took shelter there.

There were two theatres. One of these—the Great (or Tragic) Theatre—was commenced by the Greeks, but in its present state is of Roman construction. It could have seated six thousand people. The seats were of marble, and the stage was a narrow one. The Small (or Comedy) Theatre was curious in having a permanent wooden roof. Scenes of the most revolting cruelty are conjured up by the Amphitheatre with its seating accommodation for thirty thousand people. The floor was of scented pumice stone, which both sucked up the blood and afforded a firm foothold. This amphitheatre could not be used for the great naval spectacles given elsewhere.

All of us, said Mr. Whitworth Wallis, in conclusion are immensely indebted to Vesuvius for its preservation of this monument of the ancient world. Since the city was buried race has succeeded race and dynasty has succeeded dynasty. The utterance of the past is in this city more distinct than anywhere else in the whole world, and you feel you are in touch with the people of two thousand years ago. To some people it may be merely as an American said, a great many acres of ashes and rubbish with everything beneath in a very bad state of repair. To others Pompeii serves as a kind of invisible bridge linking the mighty civilisation of the past with the still mightier civilisation of the present day.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.

A MEETING of this Society was held in the general lecture room at the University on Thursday, February 23, when Mr. J. B. Mitchell-Withers, vice-president, gave an interesting lecture, entitled "A Visit in Warwickshire." Mr. W. J. Hale, president, occupied the chair.

The lecturer attended the Congress held last year by the British Archaeological Association in Warwickshire, and the buildings described were almost entirely those visited during the Congress. He referred to the military importance of Warwickshire in ancient times, owing in a large measure to its central position in the country and to the fact that several old Roman roads, including Watling Street, and the Fosse way, passed through or near its borders. He made a passing reference to a few remains of archaeological interest, such as the Rollright stones, and then proceeded to speak of Kenilworth, one of the strongholds held in the Norman period by the De Clinton family. The connection with John of Gaunt with this historic building was mentioned, and the large Hall and other portions erected by him were described, as were also the additions made by the Earl of Leicester, the favourite of Queen Elizabeth.

Other domestic buildings of the county were then described; these included the moated grange of Baddesley Clinton, the charming brick and stone mansion of Compton Wynyates, and Wroxham Abbey, the seat of Lord North, which contains portions of the pre-Reformation structure.

The lecturer then described the ancient cities of Warwick and Coventry, with their interesting churches and other ancient buildings. He dealt particularly with the church of St. Mary, Warwick, which suffered from fire and was largely rebuilt at a time when Gothic architecture was more or less a lost art. The chancel and Beauchamp chapel largely escaped damage at the time of the fire, and these with the beautiful tombs and stained glass contained in them were ably described. The churches of Coventry, chief amongst which is St. Michael's, with its magnificent tower and spire, were then dealt with, the lecturer calling particular attention to the connection of St. Michael's Church with the ancient Guilds of the city.

Leaving the ecclesiastical buildings, the lecturer described Ford's Hospital, Coventry, and the Leicester Almshouses in Warwick; part of the latter, he said, dated from 1383, although the present charity was not founded until 1571. The old chapel of St. James, adjoining the latter building, and situated over the west gate of the city, led to a description of the east gate and the large and interesting Castle of Warwick with its remains of feudal splendour.

The lecture, which was illustrated by an excellent series of lantern slides, concluded with a reference to Rugby and its school buildings, including the chapel erected from the designs of the late Mr. Butterfield.

A hearty vote of thanks was accorded, on the proposition of Mr. Horace Wilson, seconded by Mr. J. C. P. Fotherill, and supported by Mr. A. F. Watson and the Chairman.

THE ILLUMINATING ENGINEERING SOCIETY.

THE LIGHTING OF LIBRARIES.

(Concluded from last week.)

MR. J. H. QUIN said that at the Chelsea libraries arc lamps had first of all been used for general lighting, but of late years they had tried, with a good deal of satisfaction, the spiral Nernst lamps which were economical as far as current consumption was concerned, but were far from economical in the use of burners, which were expensive. Since the whole of the lighting had been changed over to metal filament lamps it seemed that they had got to the end of their troubles, there being plenty of lighting at a small cost for trouble and also for lamps. The figures might be of interest. In 1906 they paid 194*l.* 16*s.* for current and this gradually came down until in 1909 it was 157*l.*, and in the year just closed 135*l.* This, of course, was only half the story as they had doubled the lights as to candle power. In 1909 they paid 20*l.* for lamps, but in 1910 this figure was reduced to 4*l.* 18*s.* 8*d.* When they were dealing with limited funds, it was of immense importance to look after the general lighting. He had his own views as to the necessity for making the newspaper part of a library attractive by increased light. They did not wish to be looked upon as philanthropic institutions but there were the attractions of public-houses, and therefore his Committee liked to see their libraries nice and bright in order to attract the loafer and other people who sometimes got into the public-houses. For many years in his reference libraries there had been standards on the tables which the readers put on and off as they pleased, and he had found a great deal of care exercised in the direction of switching off the light when it was not wanted, or not switching it on at all if it were not absolutely necessary.

At this point the President asked leave of the meeting to vacate the chair as he had another appointment to keep. Mr. R. J. Wallis-Jones thereupon took the Chair.

Mr. T. E. RITCHIE expressed his surprise that more reference had not been made to inverted lighting. This form of lighting, in his opinion, had many advantages for the general illumination of that portion of a library in which the books were housed. The question of furniture had been touched upon and in this connection inverted lighting gave an ideal amount of flexibility in the disposition of the furniture. It was often thought to be a very difficult matter to satisfactorily light gangways with inverted lighting, but he could show them that even under adverse conditions it was not so difficult as it might appear. He had one or two slides which he wished to show the meeting. The first one represented a room which was not a library but was allied to one in many of its arrangements. It was used for the

ling o f documents, and contained a number of gangways which were 6 feet long by 2 feet 6 inches wide and 8 feet high in room which was not more than 10 feet high. That room was lighted by 2 eight-ampere inverted arc lamps, and the work illumination given, on the floor in one of the corners, was 2.4 foot-candles. The illumination of the shelves and also the of the tables was very carefully measured and upon the latter it was found to be from 6 to 10 foot-candles. From the next slide it would be seen that the general tone of the bookshelves was extremely dull, it being necessary to give 1½ minute exposure at 22, using the lamps as the source of illumination. The next slide showed the heights on the bookshelves at which the illumination was measured, and it was to be seen that on both sides of the shelves the lighting was remarkably even, and the general effect would have been improved by the adoption of Mr. Harrison's suggestion of the use of a druggist on the floor. The first reading from the floor was at a height of 17 inches, there being 2.63 foot-candles; at 30 inches there were 2.66; at 43½ inches the reading was 2.71; at 57 inches it was 2.9; at 71 inches it was 3.07 and at 83 inches it was 3.4 foot-candles. In other words, the maximum variation in 8 inches was only 0.85 foot-candles. He thought these figures demonstrated very conclusively what could be done by the suitable use of inverted lighting, and librarians ought not to ignore that aspect of the situation. He believed that if the system were more generally adopted libraries would be much more frequented by those who had any ideas of personal comfort and any consideration for their eyes.

Mr. V. H. MACKINNEY said the engineers of the Holophane Co. had shown considerable interest in this discussion, the results of which they felt would be of great service to them in their everyday work. Since the last meeting, with the permission of the Patent Office Librarian, they had been permitted to submit a scheme for lighting the alcoves at the Patent Office. These were about 15 feet long by 12 feet wide, the height being about 12 feet. The two longer sides of the rectangle were lined with bookshelves, there being a table about 8 feet by 4 feet down the centre. The old arrangement of lighting was to have pendants of four lamps of about 2 watts hung about 3 feet above the table and near the centre, this serving to light the table and the bookshelves. This method had served for several years, but since the last meeting he believed a new method devised by the Patent Office's own engineers had been tried. Then the Holophane Co. were allowed to submit a scheme. The illumination on the table by the original method varied from just over 2 foot-candles to just under ½ foot-candle, whilst at the lower end of the bookshelves it was as low as one-third foot-candle. The new scheme of the Patent Office engineers had increased this illumination on the tables to from 3½ foot-candles in the centre to 2½ at the edge. By the scheme which the Holophane Co. were allowed to submit the illumination right along the centre of the table was 4 foot-candles whilst at the edge it was 4.4 foot-candle. On the bookshelves they were able to increase the illumination six times and this had been accomplished in spite of certain difficulties such as having to suspend the lamps in a certain way from the ceilings, that there must be no new wiring, and that the present wattage had to be made use of, &c. The old arrangement of the lighting was to have two lamps on each side of the table, with the result that the shadows of the readers were cast upon the table by the lamps. Under the Holophane Co.'s method there were arranged three lamps down the centre of the table without any shades. The speaker then drew attention to a new form of reflector which the Holophane Co. is experimenting with, the object being to throw an even illumination over a flat or nearly flat surface. When perfected, this should be of great value in the illumination of bookshelves. Dealing with the question of indirect lighting and the use of arc lamps as mentioned by Mr. Ritchie, he said the distinct disadvantage of any method of indirect lighting was the tendency to a higher value for the upper plane of the hemisphere. There was a need for a greater value for the working plane. He did not regard some form of general illumination plus table lighting as the ideal for library lighting and in this connection they must pay attention to the nature of the desks. Sloping desks ought to be used to get the maximum result, and possibly the ideal system to be aimed at would be local lighting of desks with sloping tops, individual lighting for bookshelves and keep the general illumination as low as possible. He suggested 10 foot-candles on the bookshelves and one-tenth foot-candle for general illumination.

Mr. V. C. MIDDLETON said he was thoroughly in agreement with Mr. Haydn Harrison's remarks as to the general arrangements for lighting in libraries. He had never had to light a library but he had had to deal with similar rooms and his experience was that the indirect lighting referred to by Mr.

chie was not even possible—at any rate in the buildings had had to deal with—owing to the absence of suitable surfaces to act as a reflecting medium, presumably due to decorative considerations. Mr. Ritchie's slides showed how indirect lighting could be used in suitable circumstances, but these circumstances had invariably been absent from the buildings he had had to deal with. He would like to ask Mr. Ritchie how the cost of indirect lighting by means of arc lamps compared with metal filament lamps, because, as one of the librarians had pointed out, the cost of current entered largely into the question, and it seemed to him that the use of arc lamps for library lighting must entail a considerable addition to the cost of current. He commented upon the large number of libraries in which the lights were exposed to the eye and the very unsatisfactory nature of such lighting, especially when the lamps were near the ground level. Great care should be taken to shield the lamps from the eye and to make the general lighting subsidiary to the local lighting for reading on tables. With regard to lighting of tables, he thought the thing to aim at was to have the weakest possible light and should be possible to have lamps the light of which could be varied according to the fancy of the reader. He had had experience with lamps of this class in bank work and they seemed to give great satisfaction. Adjustable shades were so useful things to have in the same connection. With regard to the very interesting figures taken from lamps in position in libraries, as a contractor he realised the great difficulty in arriving at any definite figures beforehand of the exact amount of illumination required for say lighting tables or bookshelves, i.e. before the building existed. As a contractor his experience was that whatever arrangement he might be called upon to tender for was invariably altered later, and nobody seemed to be able to work out beforehand the scientific distribution of light. Certainly the contractor could not be expected to do this when he did not know where the light had got to go. Consequently, it seemed to him that the poor contractors must look to the architects to be more certain in their requirements when they asked a contractor to tender, because otherwise they were putting upon him an impossible task: they were asking the contractor to work out something on scientific lines without giving any real data upon which to found his calculations.

Mr. H. V. HORWOOD (Patent Office) said he only spoke again because the results of certain experiments at the Patent Office had been mentioned. Some of these experiments were quite personal and did not concern the Government in any way. It seemed to him that it was a question of what did the public want and how was the architect going to supply it, and when he had supplied what was required how was it going to be altered, if necessary. At the Patent Office they were now altering what the architect had put in, and from this point of view any experiments were valuable because they gave valuable information to other people working under similar difficulties. What had been done at the Patent Office was to take out the clusters of four lamps, as obviously they left the corners of the bookshelves in darkness. In order to make alterations without extra expense they had merely re-arranged the position of the lamps. At first they were placed too close to the tables for reading purposes and the next re-arrangement showed that they were too close to the bookshelves and that the bottom and least used books were best lighted. Leaving the lamps down the centre of the table, they were then dropped a little lower with the result that they got about 0.6 foot-candle at the corners of the bookshelves, which was not bad for the purpose merely of finding a book. At the same time with old bindings it was not very distinct reading and more light still was wanted. Further experiments, however, were still being carried out, the details of which must not yet be made public. It seemed to him that what librarians wanted to know first of all was the minimum light that a man ought to have for reading by in the ordinary way; how much light he ought to have if he were puzzling out a reduced diagram in a newspaper or trade journal and so on. What he would like was a specification saying how much light was required to read a small scale drawing; how much to read an ordinary book; how much to find a book on the stack; how much illumination for the book face, &c., and it would be the fault of the librarians if they did not carry such a specification out.

Mr. W. H. TOPLEY (Croydon) said he was disappointed that the speakers who had referred to diffused lighting had mentioned it merely as a means for getting about the library, and that for the actual purpose of reading it was a thing to be avoided rather than otherwise. Personally, he entirely disagreed with that view. Unquestionably they should first of all make the greatest possible use of daylight in the lighting

of libraries, and then adopt indirect methods of lighting artificially. Mr. Jast had mentioned experiments with indirect lighting in a magazine room of the Croydon library. This room was some 45 feet by 30 feet and 14 feet high. It was very dimly and unsatisfactorily lighted, and in the course of the re-arrangements the walls were coloured a very light shade and the ceiling white, and the sole source of artificial illumination was a number of lamps with reflectors placed close up to the ceiling entirely out of range of the eye of any reader in the room. It was a satisfactory and fairly economical light and the experience of those using the room was that it is a most desirable form of lighting. This sufficiently indicated to his mind that indirect lighting in itself was a desirable thing where it could be got, and he preferred to express the relative positions of the two forms of lighting by saying that as far as possible indirect lighting should be extended and open lighting reduced to the smallest possible limits.

Mr. J. S. DOW, the assistant hon. secretary, then read a communication from Mr. J. S. WALDRAM on the subject of daylight illumination. The writer regards this as important as artificial lighting, particularly because people read so much during daylight hours. Moreover, the architectural features limiting the admission of daylight could not easily be altered. The value of high angle lights was now becoming recognised by the architect. In practice the greater part of the light used for reading came from a high angle of 70 to 85 degrees above the horizon. Therefore he preferred top light windows to vertical ones, and this was one reason for the comfort with which people could read in fading daylight in certain libraries such as the Patent Office library, British Museum reading room and St. George's library in Buckingham Palace Road. Yet in the two first cases readers received only 7/1000 and 5/1000 of the outside illumination respectively. In conclusion, therefore, he advocated lighting where practicable from the ceiling instead of the walls, and the upper portions of the walls should be light in colour.

Mr. JUSTUS ECK (Union Electric Co.), on the question of indirect lighting, said a good deal had been said about the intensity of light, but it seemed to him that considerable attention must be paid to the quality of the surface one is reading from. Mr. Darch had particularly mentioned modern glazed printing surfaces, from which it was inevitable that some reflected light got into the eyes and spoiled either the contrast of the print or the beauty of the illustration, and it was in this connection that the question of indirect lighting required the greatest consideration. All those who had had to work very closely at books or read at night or make calculations or drawings by means of indirect lighting would agree with him that there was no other form of lighting with which they had continued to work without that fatigue which told that it was time to go home in the evening. In an office he knew it was very difficult for the people there, who were working with indirect lighting, to realise the time in the evening, so little did they feel the fatigue of their work.

Mr. J. DARCH briefly replied to a few of the points raised in the discussion. As to what was the proper illumination for reading, he was inclined to think that it was best to use a lamp that could be swung up and down and thus be made to give from 2 to 12 foot-candles. This would be a very useful light, and the movable fitting would enable almost every taste to be satisfied. With regard to indirect lighting he had mentioned this as very desirable where possible, but there were many places where it would be quite unsuitable and where direct lighting would be very much better. It was a matter entirely of circumstances. Further, direct lighting was much the cheapest. Several speakers preferred to make general lighting answer all purposes, but he thought this was a great mistake. It was very expensive. For instance, if 5 foot-candles were required upon the table and the general lighting was 10 feet high, it would need 250 foot-candles to give this amount on the tables, besides which, there would be an enormous blaze of light all over the place and a consequent waste of current. For general lighting he thought that 0.75 foot-candle was sufficient as an average figure, but circumstances would alter the quantity required. For instance, in a room with dark walls having paintings, such as at the Society of Arts, a greater amount would be necessary owing to the poor surface brightness.

Mr. JAST, who was unable to be present, sent a communication in which he said he regarded local illumination merely as a necessary evil, and disagreed with the contention of Mr. Darch that general lighting alone was inefficient. The only possible standard by which to judge the perfection of artificial illumination was daylight; it logically followed that as we departed from diffused lighting just so far was our artificial lighting bad and reliance upon local lighting was, he thought,

a precise measure of our failure to solve the problem. Mr. Darl had advocated that each reader should control his own light, but he regarded the suggestion as undesirable, as it was not practicable to consider the idiosyncrasies of each individual person. A point of fundamental importance was the intensity of illumination desirable from the physiological standpoint. It was a commonplace that people demanded a higher illumination to-day, but how far was this a matter of fashion set by the greater brilliancy of modern illuminants and to what extent a real physiological want? He would like to be re-assured upon this point before forming a definite decision as to the order of illumination desirable; there seemed to be a need for exact research on this matter. If no data on this point were available, he hoped the Illuminating Engineering Society would take the matter up and organise a truly scientific enquiry.

Mr. J. DUFF BROWN said there seemed to be a great deal of general agreement upon this question of library lighting. With regard to local lighting, he thought a lamp on a table was a great nuisance. Some of the speakers had been rather severe on the architects, but it must not be overlooked that architects were not lighting experts. It seemed the practice at present to bring the wires to certain points in a room and to finish the room off before the fittings were added, thus making it impossible to alter the positions afterwards. He suggested that in all new buildings the wires should be brought only to the corners of the rooms, and thus give the lighting engineer a chance to experiment as to the best positions for the lights. In conclusion he suggested that a committee should be appointed consisting of architects, librarians and engineers, to fix a set of normal conditions for library lighting. No doubt certain conditions could be drawn up by a committee which would avoid, for instance, present methods of bringing wires into buildings, and the whole thing considered upon a scientific and satisfactory basis.

The Chairman proposed a vote of thanks to the authors of the papers, and announced that at the meeting on February 16, the subject of school lighting would be discussed. Dr. J. Kerr, Medical Officer to the London County Council, would open the debate.

UNIVERSITY OF LONDON LECTURES ON ARCHITECTURE.

ROMAN Tombs, Aqueducts, and Bridges were discussed by Mr. Banister Fletcher in his lecture at the British Museum on February 14.

Roman tombs are numerous as compared with those of the Greeks, and bear a close resemblance to Etruscan examples. Ordinary burial as well as cremation was practised, the bodies of emperors being usually burned on funeral pyres from which an eagle was set free, symbolising the flight of the soul.

Towards the second century, however, cremation became less usual, the wealthier classes having their bodies embalmed and placed in sarcophagi, while those of the slaves and freedmen were reduced to ashes and placed in urns in the same apartment with the sarcophagus; but ordinary burial was associated with Christianity from all times.

The columbaria were recesses or niches cut in the tufa to receive the urns (ollæ) containing the ashes, or the sarcophagi of those who were buried. These columbaria were usually in caves or subterranean vaults outside the city, as interment was strictly prohibited within the walls of Rome with certain rare exceptions.

The catacombs were easy of access until the services which the early Christians conducted in them were forbidden, when their entrances were made secret.

Monumental tombs, probably a survival of the prehistoric tumuli, strengthened at the base by a ring of stones, were usual with the Romans for important personages.

The tomb of Cecilia Metella, on the Via Appia, is an example of these.

A circular mass of masonry 94 feet in diameter is supported on a square podium measuring 100 feet, which contains the tomb chamber. The frieze of the entablature is carved with ox-skulls and festoons, and probably the tower was crowned with a conical roof. The Ghibelline battlements were added in the Middle Ages.

The Mausoleum of Augustus was erected for that emperor and his heirs. As described by Strabo and others, it is known to have had a square basement surrounded by a colonnade, and supporting a circular mass 220 feet in diameter which contained the tomb chambers. A mound of earth laid out in terraces and grown with cypress trees covered the circular structure.

The Mausoleum of Hadrian, A.D. 135, now known as the Castle of St. Angelo, was planned on axial lines with the Pons Ælius which Hadrian built to connect it with the Campus Martius on the opposite bank of the river. The Mausoleum of Augustus had been filled by the various members of the Gens Julia and succeeding emperors, Nerva being the last; Trajan selected his own burial-place beneath the monument, so that a new imperial mausoleum became necessary for Hadrian. This consists of a square basement 2 feet wide and 75 feet high, which supports a circular tower 230 feet in diameter and 140 feet high. It had a marble peristyle and was crowned with a conical marble dome formed of steps. In size and magnificence the Mausoleum of Hadrian is said to have exceeded that of Mausolus of Halicarnassus.

Under Alaric the Goth, in 410 A.D., it was rifled and shortly afterwards was turned into a fortress. When besieged by the Goths the statues which stood on the square podium and between the columns of the encircling colonnade were hurled down upon the heads of the invaders, and were discovered in the seventeenth century in the moat. Among these were the "Dancing Faun" and the "Barberic Faun." Gregory the Great consecrated the building under the title of "St. Angelus inter nubes." In the tenth century it became a fortress, and in the Middle Ages, owing to the immense strength of its walls, it made a safe refuge for the Popes in times of danger, as it communicated with the Vatican Palace by a covered way. It has now been turned into a museum.

The tomb chamber was reached in a very complicated manner by a series of inclined planes to allow heavy sarcophagi to be dragged up on rollers, but communication is cut off at various points by trap doors in order to mislead and defy detection. The sarcophagus of Hadrian, which was of Egyptian porphyry, was destroyed by fire when removed to the Lateran basilica, but its lid forms the font in the Baptistery of St. Peter's. The conical dome and general arrangement of the mausoleum can be seen on the bronze doors of St. Peter's.

The Pyramid of Cestius, tombs on the Appian way, at Pompeii and various other interesting examples were also discussed by the lecturer, who then passed on to consider the aqueducts of Rome.

It was all important that a city like Rome should have a proper and adequate water supply. The reservoirs of the thermæ and the fountains consumed an immense amount, to say nothing of the domestic needs of the population of the city. The Romans were well acquainted with hydraulic law, and knew that water in a closed pipe will always rise to its own level, since they had an abundant supply in the upper storeys of their houses, carried in leaden pipes, but lead was very expensive and quite impracticable for long distances, not being sufficiently strong, and iron pipes were not then invented. They therefore brought their water from great distances by means of raised channels or aqueducts, having a gentle slope from the starting point. The water was conveyed in a specus or closed channel lined with hard cement carried by long series of arches often several tiers in height, which were easily constructed by slaves; this method was found to be the most economical of any, and has been reverted to in modern times with success in the Croton Aqueduct which supplies New York city.

Near the Porta St. Lorenzo there is a triple aqueduct; the lowest span carries the Aqua Marcia, the middle one the Aqua Tepula, and the highest the Aqua Julia.

Near Nîmes, in the south of France, there are remains of an excellent example built by Agrippa to serve the town of Nîmes. Originally it was 25 miles long. The Pont du Gard, as it is called, has three tiers of arches where it crosses the river Gard. The lowest arches at this point have a span of 78 feet. The masonry is laid without any mortar; the tiers supporting the arches are built with ledges, like impost blocks, on which to rest the temporary centring, which could easily be removed from arch to arch, the ledges remaining and serving always for repairs; in the larger arches the voussoirs are also made to project to support the centring. Other examples at Taragona, Segovia, &c., were shown upon the screen and discussed.

Roman bridges were remarkable for their solidity of construction. They were built level with the road and did not rise. The Pons Milvius is an interesting example. In the thickness of its piers it has arches to allow the water to flow through, in order not to cause too great an obstruction. This bridge was the scene of the defeat of Maxentius and his army by Constantine.

COST OF SCHOOL BUILDINGS.—II.

COMING to the principal subject of reference to the Committee—the question of reducing the cost of school buildings by the use of materials or methods of construction different from those ordinarily employed at present—we find that consideration was given to various novel materials and methods, which were classified under seven heads:—(1) Steel frame buildings; (2) reinforced brickwork; (3) ferro-concrete buildings; (4) brick buildings with solid nine-inch walls; (5) brick buildings with thin hollow walls; (6) timber frame buildings with slab casing; (7) wooden buildings. In class (1) there were grouped several sub-divisions: (a) with thin solid curtain walls of concrete; (b) with hollow curtain walls of concrete slabs; (c) with curtain walls of brick, hollow or solid; (d) with curtain walls of patent materials; (e) with hollow curtain walls of expanded metal faced with cement and plaster.

The use of steel frame buildings with thin solid curtain walls of concrete, the Committee considered, would reduce the cost of school building by 20 to 25 per cent., but against this must be set the probability of increased cost of maintenance, first by reason of repairs required from the cracking of the concrete filling, and secondly by reason of the greater cost of warming buildings with walls only four inches thick. If hollow curtain walls of concrete slabs were adopted, some of the objections to the solid four-inch walls would be obviated, but the Committee had no evidence as to the increase of cost thereby occasioned.

Steel framework construction with a filling of brickwork appeared to be as economical in general as with thin walls of concrete, the relative cheapness of brick or concrete being dependent on the precise circumstances in any particular case.

Of patent materials used as curtain walls for steel frame buildings the Committee seem to have confined their attention to "Frazzi" blocks and "Fram" slabs, and whilst they express their approval of these articles as regards suitability, they do not give any definite conclusion as to cost other than quoting a claim of the director of the Frazzi Company that his system would effect a saving of about 40 per cent. as compared with brickwork.

Steel frame buildings with a hollow curtain wall of expanded metal faced with cement and plaster proved in a district where brick building is costly to effect a saving of 25 to 30 per cent. in the cost of the walling, but the Committee was not satisfied that this reduction would be maintained where bricks could be obtained at all readily.

With all varieties of steel frame building and thin walls it is pointed out that economy in foundations is rendered possible by the lighter building, and that on an insecure foundation a wall contained in a steel frame is certainly safer than a plain brick wall.

FORTHCOMING EVENTS.

Monday, March 13.

Royal Institute of British Architects: Mr. J. A. Gotch, F.S.A. on "The Burlington-Devonshire Collection of Drawings." Victoria and Albert Museum: Mr. Banister Fletcher on "German Gothic Architecture." (University of London Lectures.)

Tuesday, March 14.

Nottingham Architectural Society: Exhibition of Designs for Urban District Council Offices, and criticism by Mr. F. W. Gregory. Illuminating Engineering Society: Discussion on "School Lighting." British Museum: Mr. Banister Fletcher on "Byzantine Architecture." (University of London lectures.)

Wednesday, March 15.

Carpenters' Company: Mr. W. Bainbridge Reynolds on "Metal Work."

Thursday, March 16.

Carpenters' Company: Mr. M. C. Duchesne on "Woodland Industries."

Reinforced brickwork used in hollow walls of two 4½ inch or 3 inch skins appeared to the Committee to be likely to prove suitable and satisfactory for school purposes, and under some conditions might also be economical, and an example is quoted of an instance in which a building was constructed with reinforced brickwork for 500l., whilst a similar building in 14-inch brickwork cost 900l.

The Committee does not on the whole appear to regard with favour the use of ferro-concrete for school buildings. No case was brought to their notice in which a school has been erected in ferro-concrete, and when alternative estimates have been obtained the cost of a ferro-concrete building has been shown to be higher than that of an ordinary brick building. The expense of shuttering and centring seems to absorb any saving in the material, and the general design of schools, with their large areas of window-space, does not lend itself to economy in ferro-concrete construction. It is suggested that a limited use of ferro-concrete as a substitute for steel on the general principle of a steel-framed building might in some cases prove economical, but it is pointed out that in the use of ferro-concrete great care is required in the planning and skilled supervision in the actual course of construction, the margin of safety in this form of construction being usually small, so that a slight error in calculation or any scamping of the work is proportionately a more serious matter than in older forms of construction.

With regard to brick buildings with solid 9-inch walls, the Committee is of opinion that it does not appear that any great saving would be effected by the adoption of 9-inch in place of 14-inch brick walls, but that a 9-inch wall, if properly supported and suitably treated on the outside with rough-cast, cement, stucco, tile hanging, or other material which will ensure dryness and contribute to warmth inside, might be permitted for school buildings.

Considerable diversity of opinion prevails as regards the suitability for school purposes of 11-inch walls, built with two thicknesses of 4½ inches and a space of about two inches between. Whilst the general opinion is that such walls would be better than 9-inch solid brick walls for retaining warmth and resisting damp, but inferior in constructional strength and objectionable on account of their tendency to transmit sound, these opinions are not universally held.

Timber framed buildings, with slab casing, appear to be sound and comfortable, and although it is not easy to say what saving could be effected by the use of this method of construction for schools under ordinary circumstances, the Committee thinks that it may repay further investigation by local authorities in cases where the necessary materials can be easily obtained.

Wooden buildings, it is stated, will probably prove the most satisfactory and economical for temporary schools,

under ordinary conditions, and the chief objection, the risk of fire, is considered by the Committee to be practically negligible so far as the safety of the scholars in country schools is concerned if the building is on one floor and suitable means of exit to the open air by windows or otherwise from each room are provided. Such buildings are more comfortable and satisfactory than buildings of corrugated iron lined with wood, although they would probably require a larger expenditure for maintenance in painting, &c.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

ALTHOUGH the conditions gave a free choice of a medium between monochrome brushwork, pencil or crayon in the shaded drawing which formed the subject for February, all the contributors have selected pencil, a natural thing perhaps for architectural students to do. Hence there has been a disposition on the part of the majority to follow the diagrammatic method which is particularly characteristic of architects' drawings generally. Too much reliance is placed upon line and too little upon the expression of light and shade by variation of tone upon tone. The line method of drawing carved ornament is useful for sketches that are intended as memoranda only of something seen, or as suggestions for a craftsman who, in his execution of an architect's design, is left with a fairly free hand in his rendering of form and modelling.

Probably from such a sketch no two carvers would produce the same result, as the personal equation of the craftsman would exercise a dominant influence on his interpretation of the design. We are not prepared to say that this is wrong, but the consequence is that the finished work is not entirely the creation of the original designer.

It is very desirable that occasionally architectural students should make careful studies of the rendering of modelled or carved ornaments by the use of tone upon tone, eliminating entirely the use of definite line. This, of course, requires more time than the line or diagram method of drawing, which, it should always be remembered, is no more than a kind of shorthand delineation.

Mr. J. T. PILLING has approached nearest to the tonal method in his drawing of a stone urn from Ebberston Hall, Yorkshire, of which COLIN CAMPBELL was the architect in 1718. Mr. PILLING, in aiming at a brightness that the original can scarcely possess, has falsified some of his tones and there is a lopsidedness in his drawing that must be due either to incorrect draughtsmanship or the selection of an unfortunate point of view of a badly-balanced design.

Mr. E. H. GIBSON sends a drawing of a memorial tablet from the Slingsby monument in Knaresborough Church, Yorkshire, an example of late seventeenth-century work. The drawing is obviously made by artificial light, and the chiaro-scuro is accordingly rather forced. Mr. GIBSON's drawing is, so to speak, a compromise between the line and tone methods, which might have been improved by a little more care in the form of his shading lines so as to suggest the direction of curvature of the surfaces.

"Sans Peur" has selected for his subject a carved newel from the staircase of the seventeenth-century Hospital of the Holy Jesus at Newcastle-upon-Tyne. The finial is in the form of an heraldic lion holding a shield, but the draughtsman has made the mistake of representing it in front elevation. The drawing is lacking in gradation of tone and the values are incorrect. Evidently the author has not given sufficient time to his drawing.

"Plato" gives us an excellent example of a drawing that is frankly of the shorthand type, in which the forms are outlined and the shading is suggestive only of the modelling. The subject is a frame from the tomb of HENRY VII. at Westminster. On the same sheet is also a sketch of part of an iron gate panel of sixteenth-century Italian work. "Plato" also sends a sheet of sketches of carvings of "misereres" or "misericords," as Mr. BOND calls them, from the chapel of New College, Oxford, but

we cannot regard these as examples of Renaissance ornament.

We have decided to divide the prize this month equally between Mr. E. H. GIBSON and "Plato."

NOTES AND COMMENTS.

WE have long held and often expressed the opinion that the maintenance by municipalities and other public authorities of permanent architectural departments is not in the interests of the ratepayers, but it is seldom that actual figures are available. The Establishment Committee of the London County Council have now let the cat out of the bag in their report of February 16 last on the reorganisation of the architect's department as regards the educational architectural work of the Council. The amount provided to be spent on works for the year ending March 31, 1911, is 246,225*l.*; the salaries of the architect's established staff directing that expenditure is 54,196*l.* 4*s.*, or rather over 22 per cent. The Establishment Committee in their reorganisation proposed to increase the salaries of the established staff to 56,434*l.* 4*s.* These salaries do not represent the whole cost of the architectural staff of the Council in respect of schools, and to them must be added the rent of offices and the cost of stationery, no small item in the architectural profession, before we can know how much the ratepayers have to provide for work which would be done cheerfully by architects in independent practice for the customary 5 per cent.

WE regret to receive intelligence, from the columns of the *Manchester Courier*, of the death of Mr. JOHN MERVEN CARRERE, of the firm of CARRERE & HASTINGS, at the early age of 52 years, as the result of a collision between a tramcar and a taxicab in which he was riding. Since the death of Mr. McKIM, about a year ago, Mr. CARRERE has undoubtedly occupied the leading position among the architects of the United States. He was born in Rio de Janeiro in 1858, and after being educated in Switzerland he graduated at the Ecole des Beaux-Arts in Paris. He started in practice in New York as an architect in 1884. Many of the residences in Fifth Avenue are of Mr. CARRERE's design, and he has exercised a very strong influence on the style of domestic architecture in America. His leanings have been towards French work, which is accounted for by his early training. He first came prominently into notice with his design for the New York Cathedral, and in the course of his professional career he has built a number of churches and other public buildings, as well as several big country houses with elaborately laid-out gardens for American magnates, all of which evince ability of a very high order.

THE controversy at Liverpool concerning St. George's Hall and the KING EDWARD Memorial is still raging, and looking at it from the point of view of an outsider we do not think that Professor REILLY, the protagonist of the opposition to Mr. NORMAN SHAW's proposal, has up to now the best of the argument. He relied upon a drawing of Professor COCKERELL's dated 1860, which he stated lay at the Municipal offices. The other side reply that the plan of 1860 was not signed by COCKERELL, that there is no satisfactory evidence that the plan was COCKERELL's, and that when he completed his work at St. George's Hall in 1854 he left steps similar to those which Mr. NORMAN SHAW proposes.

WE are particularly impressed with the apparent weakness of Professor REILLY's case because he strives to bolster it up with the assertion: "So strongly has this objection (i.e. to the steps) been felt that the architectural profession throughout the country, for the first occasion in modern times, has been practically united." This is consummate impudence. The architectural profession throughout the country is too level-headed to take sides in a dispute in which Mr. NORMAN SHAW and Mr. BELCHER on the one hand are opposed in opinion by Sir ASTON WEBB and Mr. REGINALD BLOMFIELD on the other. Nor

is the profession disposed to follow the lead of a couple of comparatively young men like Mr. ADSHEAD and Mr. REILLY, even though they are professors at Liverpool University, and although they may have induced many members of the Council of the Royal Institute to express an adverse opinion on the original scheme, which it is now proposed to amend.

IN *The Connoisseur* for this month are some good illustrations of "Some notable fireplaces," with a short description. The examples are some of them beautiful and some merely curious, but of course do not deal completely with the subject, to do which would fill several volumes. Mr. EGAN-MEW gives us some more examples of Old Lacquer from Japan, another almost inexhaustible subject.

IN a letter to *The Times* Lady CONSTANCE EMMOTT comments with sarcastic severity on the cause of a fire at her house—the insufficient filling-up of a fireplace opening in the fixing of an oak chimney-piece. This is one of the details of house-building which it is practically impossible for anyone to supervise if the actual workman is incompetent, careless, or not conscientious. There are so many details in building that come under this category that it is dreadful to contemplate how much we are at the mercy of the modern workman, who, under the baleful influence of trades-unionism, has eliminated thoroughness and efficiency from the list of qualities that should form part of his character.

THE suitability of architecture to its environment may well be studied in some charming sketches from the Italian Lake district by Major F. A. WILKINSON that appear in the *Art Journal* for this month, which also show how small a part detail may occasionally play in the production of the picturesque. In the same issue Mr. LUTHER HOOPER discourses further on Art in the Church, with illustrations from the Church of St. Albans, Hindhead. The Glamour of Landscape, as illustrated by Italian painters of the early fifteenth century and the Van Eycks, is the subject of an article by Mr. C. LEWIS HIND.

THE series of illustrations of the Oxford Colleges which is in course of publication in *The Architect* is being reproduced in separate form, and the first part, dealing with Merton College, has now been published, with fourteen plates of this one of the most picturesque and charmingly old-world of all the colleges in the University.

JOINERY WORK IN OLD LONDON.*

By Mr. ARTHUR KEEN, F.R.I.B.A., President of the Architectural Association.

(Official Report.)

I FELT a good deal of hesitation in accepting the invitation to give this lecture, because I should be speaking to an audience of carpenters about things that concern their daily calling, but which I only know of from the outside. But the subject is such a wide one and covers such an immense number of features that I felt I might be able to throw some light on it from the side that concerns me more particularly as an architect. In any case, I feel it an honour to be of service in any capacity to a Company that has maintained the tradition of good craftsmanship in this great city of London for some six or seven hundred years.

But looking at the matter in another light, I have to remember that I have learnt many things from carpenters in connection with my own work, and it is only fair to do what little I can in return.

I had the pleasure a while ago of hearing a very able speech by one of His Majesty's Ministers, in which he pointed out that the old apprenticeship method of training was rapidly becoming a thing of the past, and he laid it on architects as a serious charge that they, being most of all interested in maintaining a high standard of work, should see to it that in some other way the young workmen of the

day should have an adequate training. For my own part, to the extent of my ability, I accept the charge, and I am glad of this opportunity of meeting my obligation.

I can tell you nothing that you do not know about the use of your tools, the conversion of timber, the making of glued joints, and the general things of the workshop, but the question of the external appearance of your work—the decorative and artistic side of it—is my concern as well as yours, and it is of this that I am to speak this evening.

There are certain matters in the design of which the English have particularly excelled; lead work is one of them, plaster work is another—but probably in nothing so much as in woodwork are they distinguished from the craftsmen of the countries across the Channel.

In timber-built houses, in wonderful ships, in roofs of churches and halls, in beautiful joinery work, you young men can look back to a tradition that has been maintained for centuries past at a very high level, and in a way that must have commanded the admiration of those best qualified to judge in every time.

I had the opportunity of attending here last summer at the examination for the certificates of this Worshipful Company, and while I came away admiring very much the technical ability that had been acquired by many of the candidates, I was distressed to find how far the knowledge gained seemed to depend on the text books of construction, as if the height of a carpenter's ambition were to know how to frame a queen-post roof or a stud partition, or to form a matched board dado with a skirting and a capping, or to make a pair of French casements that would keep out the wet but would be fit for nothing better than a Margate lodging-house. These things are well enough in their way, but they are only the beginnings of what a carpenter ought to know; they are as it were the learning to write, but afterwards comes the question of what to write. And I look forward with confident hope to the time when you carpenters will be men able to design your work in a capable way as well as to make it so well. I suppose there never was a time when one could get the work itself so well done as now, but all the same the average carpenter knows nothing worth talking about as to the design of his work so as to make it interesting in appearance and comparable with the work of the past.

Now a carpenter ought easily to become a good designer, because he has the stimulus that is given by handling the actual material—a stimulus that is the greatest want of the architect who designs on paper. The material of work offers at once certain possibilities and limitations which are a very material help in design. A mason who was given an odd lot of stones and bricks and flints or pebbles with which to lay the pavement of a court-yard would produce a far more interesting result than if he had made a plan on paper, knowing that he would then be supplied with the material to carry it out.

Mr. Whall considers, quite rightly no doubt, that a great part of the interest in mediæval stained glass windows depends on the fact that glass was costly and every little bit had to be used up. This fact stimulated the designer, and kept his work from getting dull and monotonous.

If you give a mere savage a handful of beads with which to decorate a belt he will proceed to sort them into sizes and shapes and colours until he sees exactly which ones can be used for spots and which for lines and borders, and which for filling up, and he will then work them out into a pattern that will be properly disposed over the surface to be ornamented, and will use up every single bead and will be a beautiful thing when it is done.

I think the design of very much of the old timber work, say in the roofs of churches, depended very much on this kind of limitation and selection. Everyone has wondered at the fact that the roofs of old churches so often fail to fit the divisions of the stonework below them, and it is generally explained by pointing out that they belong to a later date—which always seems to me a very lame and inadequate explanation. I think it is more probably due to the use of particular materials. The roof of St. John's Church at Leeds has the principals spaced quite irrespective of the stone piers and arches below, and yet this church, which was erected about the year 1634, was carried out completely at one time.

I believe the reason in this case was that the roof is panelled throughout with most beautiful plaster panels which are all of one size and which seem to have been taken as the unit of measurement controlling the divisions of the roof.

In the old days the cutting up of timber was a difficult

* A lecture delivered at Carpenters' Hall on March 1. Sixth of the Series on "The Arts Connected with Building."

and costly matter, and the quantity of suitable stuff available in one place was limited. There would be a certain number of pieces suitable in size and length for tie beams, a certain number that would make good purlins, some suitable for brackets, some that would have done for rafters if they had been longer, but were good for spurs or struts and so forth, and it is easy to see that these considerations would at once settle the kind of roof that could be made, the number of trusses, whether or not there should be smaller trusses between the main ones; how the trusses should be built up, whether the purlins should be near together or far apart, whether they should be strengthened by brackets or not, and so forth. I do not suggest that I am indicating the whole secret of the beauty and interest of an old timber roof, but I am quite sure that a great deal of it depended on the fact that the designer was the man who was handling the stuff and studying to make the most suitable and economical use of every piece.

Of course the great part of the secret lay in the fact that the men who made these wonderful roofs that we see in Suffolk and Somerset and other places had been taught their business as designers and not merely as workmen; they

ALTAR, ST. STEPHEN'S, WALBROOK, LONDON.

worked in the traditional way and did the things that their fathers had taught them with such improvement as their skill and imagination led them to.

If you look in Evelyn's Diary you will find an entry, dated 1668, in which he says:—"Was launched at Deptford that goodly ship the 'Charles.' She is larger than the 'Sovereign,' and carries 110 brass cannon; she was built by old Shish, a plain, honest carpenter, master-builder of this dock; but one who can give very little account of his art by discourse, and is hardly capable of reading. The family have been ship carpenters in this yard about 300 years." Here is probably the finest ship that had ever been built up to that time—a big British man-of-war—built by a plain, honest carpenter who could hardly make shift to write his own name.

It is worth while to go to Greenwich Hospital and see the models of some of these old seventeenth and eighteenth century ships and to marvel, not only at the skill and judgment shown in their construction, but at the beauty of the lines and the charm of the purely ornamental parts. You notice at once the judgment with which the timbers are

spaced to give the greatest strength where most of the strain comes—almost solid wood on the bottom, a reduction of material higher up, and an increase again between wind and water as a special protection at that dangerous point. The timbering of the decks framed everywhere into short lengths so as to give the utmost strength and support to the sides of the ship. The curving in of the upper part of the hull to help to keep the enemy from boarding the ship, and perhaps to reduce the danger from large quantities of water washing into the upper deck in a rough sea. The beautifully moulded curves fore and aft where the bulwarks rise to the upper decks. The wonderfully built out prow from which the bowsprit starts; the keel brought up with a fine curve and continued right out to the very extreme point to carry a carved figure of a king or saint or even of a man on horseback; the picturesque cabins projecting out like bay windows and built up high at the back and covered with curved roofs finished with ornamental lanterns or carved figures. Then the astounding masts and yards built up of innumerable timbers, stayed in every direction and yet with nothing in the way of the free movement of the sails. The contrivances to give the shrouds a direct pull on the main timbers of the hull. From keel to cap everything arranged to have due support itself and to carry the support on to some other part. I suppose that anything more like the structure of a living creature than these old wooden ships was never contrived, and all done by "old Shish, a plain, honest carpenter." It is a thing that is worth some consideration.

I might show you the same thing by taking one of those extraordinary models of Japanese temples or pagodas shown at Shepherd's Bush last summer. Beautiful things with fine curves, good proportions, and well-designed ornament, but a careful examination of them shows that nearly all their beauty arises out of the skilful way in which the timbers are put together to meet the requirements of the building.

Precisely the same thing has obtained in this country, for I never saw here a piece of old building in wood that was not interesting. From the Guildhall at Lavenham to a humble mill or warehouse, our timber buildings show good proportion, beauty of detail, and many other characteristics of good sound architecture.

In every one of the applied arts, the designer who is, or has been, also a practical workman has a very great advantage over the mere studio man, and I am perfectly sure that those of my audience who are accustomed to bench work and carpentry have already taken an important step in the necessary course to make them competent designers of beautiful work.

Now in talking about this to a man whose knowledge and judgment I think highly of, he said: "What is the good of it all? What is it going to lead to? A modern carpenter is little more than a fitter of parts already prepared by machines, and he has less and less opportunity for the exercise of his knowledge and skill. In fact, his only chance of expansion is by becoming something other than a carpenter—say a builder or a joinery manufacturer, or something of that kind." Well, I do not know that it is my concern now to indicate what commercial outlook there is for such skill and knowledge as I would have you acquire, but I may say briefly on that point that I cannot conceive of such skill and knowledge not adding to a man's value in the market. Apart from this consideration, however, is the fact that no craft that man ever put his hand to begins and ends in mere workmanship; there is always an imaginative or intellectual side, full of interest and pleasure, and which is worth a vast amount of study and consideration for its own sake, and the craft of the woodworker possesses this aspect in a most unusual degree. The work of a joiner to-day is dull and uninteresting and very limited in comparison with that of past times, when a man was actively engaged in design and contrivance during the whole time that he was at work. But whether or not you are able to use your knowledge in the course of your daily occupation, you may get infinite pleasure and interest out of the study of fine examples of the work of past generations of carpenters. I believe, however, that you may look forward to far more than this pleasure. If I want a beautiful plaster vault or ceiling, or an artistic piece of metal work, it may be far beyond my power to express on paper what I desire, but I know of many men whom I can visit in their workshops and by discussion of models of what we find there, by sketches, by consideration of odd photographs and so forth, we may arrive at a mutual understanding of what is to be done, and I can leave the matter in their hands knowing that what is done will be a delightful work of art, and that it will meet all the conditions of the case in a satisfactory way. Why should I not be able to

find a worker in wood who will do the same thing for me if I have, say, a few yards of old panelling to be used in a room and to be extended and altered to cover the whole surface of the walls—so that the architraves and pediments, the window-linings and the parquetry shall be harmonious and suitable and that the room when finished shall be a pleasure to all who come into it; so that, if an inscription is to be cut anywhere, the lettering shall be well shaped and spaced, and suitable in character to agree with all the rest? It ought to be quite possible. One of the most interesting things to me in the South Kensington Museum is an oak beam with a long motto carved on it in raised letters that might quite well be done by a clever joiner if he had some sense of beauty and had given some study to the artistic side of his craft.

My friend, of whom I spoke just now, says that what a joiner should aim at acquiring is (a) a thorough knowledge of every detail of construction, including staircasing, dome and shaped roof work, &c., and (b) an artistic knowledge of style of all dates. And he adds that more knowledge of construction and proper balance of design is gained by making working drawings of actual examples than by all the rules, photographs or formulas yet printed. Now here I agree with him entirely, and my purpose in coming here this evening is to show you what there is near to your hand in the square mile of the City lying immediately around this building, or close about it, for your study and profit.

Things nearest to us are often the least noticed, and you may be surprised to find what endless good examples of woodwork there are near here.

It must be mostly in joinery work, because since Crosby Hall is gone, there is little or nothing left in the way of artistic carpentry in the City.

The hall of the Charterhouse shows the kind of roof that succeeded the fully developed open timber roof.

For other open timber roofs built before the Fire of London you may go to Gray's Inn, the Middle Temple Hall, or the Hall at Lambeth.

Carpentry as an artistic craft practically died with the advent of the English Renaissance, as we call it, under Inigo Jones and Wren.

There are many, many churches built by Wren in this city, but not one of them has an open timber roof. So that in this respect I cannot help you much, but I ought to point out that many of these roofs in Wren's churches are marvels of scientific and workmanlike construction as carpentry pure and simple. Not even the tie beams were allowed to show inside the church, and yet these roofs are built successfully over fully pitched vaulted ceilings and domes in a way that calls for the warmest admiration and the most careful study on your part. You may find drawings of many of them in Clayton's great book on the parish churches of Sir Christopher Wren, published in 1849, but the roofs themselves are in existence for you to go to see and to measure and examine for yourselves, and I commend to all of you as a useful exercise to go and find out how the dome of St. Stephen's, Walbrook, is made, for it is only a few inches thick between the plaster inside and the lead outside from base to apex.

The lead covered spires of many of these churches are remarkable pieces of timber construction.

While the English Renaissance in the seventeenth century put an end to artistic carpentry, it gave a tremendous impulse to joinery, not only by the alteration of its character, but by giving it a more responsible position in the treatment of architectural interiors. You probably know very well that in the time of Henry VIII. and Elizabeth English joinery work in staircases, mantel fronts, screens and panelling reached a very high level of excellence both as handiwork and as a matter of artistic handling. But it was accessory to architectural design rather than a part of it. The detail of it was small and complex, and it was used, as Professor Blomfield very correctly points out, in the manner of the tapestry and colour decoration of earlier times, although with admirable skill and truth.

In the seventeenth century a marked change appears; the panelling on walls receives careful consideration as an element in the proportion of the building; doorways and screens present well-marked architectural features, correct in section and proportion, according—as Benvenuto Cellini would have said—to the "rules of art." The organ became a general adjunct of a church, and the case for it offered a remarkable opportunity for the exercise of the joiner's art. The wooden reredos became the accepted feature of the east end of a church. Church galleries became almost universal, and their fronts were another very interesting instance of

skilful treatment in wood. Pews took the place of benches and in many cases they were beautifully carved and panelled.

At the same time staircases took on a very different method of treatment both in construction and design, and through the seventeenth and eighteenth centuries they were important and beautiful features in the artistic treatment of houses and churches.

Now I want to show you how admirably this new aspect of joinery work is exemplified in all directions within a few hundred yards from this building, and if I can induce you to seek out these examples for yourselves and give them careful and patient study, I shall have done you a greater service than perhaps you, at present, realise. You might go and look at the old gates forming the entrance to Staple Inn; they are simple enough, but they are admirably satisfying and suitable for their purpose, and as they have stood well for some 300 years, it will be worth your while to find out how they are made. The diagonal boarding at the back of the panels appears to have acted successfully in preventing the gates from sagging. There are methods of using boarding found in old gates that are little used in the present

ENTRANCE DOOR, CHURCH OF ST. HELEN'S, BISHOPSGATE, LONDON.

day, but are generally sound and good constructionally, interesting in appearance, and well worth noting and remembering.

The gates to the entrance of the Brewers' Hall are good examples of well-designed panelled and carved gates, with wrought-iron cresting on the top of them, and there are a great many gates to the old churches in the City that are well worth studying.

Then there are a good many very nice old doorways near here with columns or pilasters and pediments in various forms, and in some cases with elaborately carved brackets and shell canopies. I might show you a large number of them if I were not confining myself as much as possible to existing examples, for unhappily many have been removed or destroyed even within my memory—an additional reason for making careful drawings of the remaining ones while they do remain.

At No. 25 Crutched Friars is a doorway that for a simple, homely piece of Classic detail is one of the most delightful examples that I know of. You will find, if you make a measured drawing, that the design of it will fix itself on your memory so well that you could redraw it from memory quite a long while afterwards, and you will learn, a great

deal at the same time about the uses and forms of mouldings and carved capitals and a good many other things.

Before leaving the subject of doorways, however, there are others that are worth notice, to be found in many places—mostly in retired nooks and corners and unfrequented back streets.

One at No. 33 Mark Lane—in an inner courtyard—is a particularly rich and beautifully detailed one, executed about 1690. It must be a remarkable specimen of the joiner's art to hold together so well for 200 years, in spite of being built up of a multitude of separate pieces. It would seem very likely that Grinling Gibbons was concerned in the carving of this doorway, for the cherubs' heads are quite in the character of his work and very much like those in St. Paul's.

The whole house is an interesting piece of domestic architecture. The front is a fine example of design in brickwork, and there is a back entrance door that was probably as fine as this front one, originally, if one may judge by the portions that remain, but the pediment is gone. At the rear of the building there is an unusually elaborate wooden eaves cornice with large carved modillions and rich mouldings. And there is also a very richly carved attic cornice that is a model of good scale and proportion.

The staircase is a well-known example, and is, I think, the best of its kind that I have seen. There is a very great deal of inlaid work; the very treads and landings are inlaid in patterns, as are also the panels of the dado and other portions. In one respect the treatment of the stairs is very unusual. The end of each tread forms an oblong block

DOORHEAD, 6 FEATHERSTONE BUILDINGS, LONDON.
From a Photograph by Mr. F. R. TAYLOR.

ornamented with vertical bands of inlay and the usual carved scroll, which in this case is very beautifully carved, occurs under the oblong block at the end of the next step, with the moulded nosing running along to form a cap to it. There are most remarkable diversities in the carved and twisted balusters, and I think some of them must be due to alterations made from time to time when broken balusters were reinstated. There is a fine carved and fluted doorway in the staircase hall, and there is also standing in a corner a big leaden female figure that once formed an ornament in the garden of the house.

There are a great many other old doorways to be found, and generally of very good detail. The well-known one at St. Helen's Church belonging to the Jacobean time. A doorway, now destroyed, at Queenhill, was a very sound example. A simple one, but still well detailed, stands at 4 College Hill. One at 6 Featherstone Buildings is of very common type, but of exceedingly beautiful design, and as it combines a hood with a doorway it is a very sound example.

Then there are the two remarkable doorways in Laurence Pountney Hill—too richly detailed to be as effective as they should be, but showing a good treatment of a big carved wave moulding up the jambs.

The interior doorway in Sir Christopher Wren's house in

Love Lane—lately pulled down—was quite a well-designed piece of simple detail. The exterior doorway of this house, which had a boldly projecting cove over it, was another instance of a very good effect obtained by very simple treatment. It was approached sideways by a small flight of steps—always a picturesque treatment of an entrance. A staircase to be found at the Charterhouse may be looked at at the same time.

I am not prepared to say that all the examples you will find are sound and satisfactory as examples of design in woodwork. I feel a good deal of hesitation in accepting some examples which are quite delightful in form, because they possess characteristics that do not agree with the material they are made of. The art of the woodworker has been open to this criticism from very early times, and I think more in Gothic times than in the centuries of the Renaissance. The reason for it is, of course, that stone-masons have taken the lead and carpenters have tried to imitate in wood the forms that are suitable only for such a material as stone. So that we find arches and tracery, buttresses and even flying buttresses, pinnacles and other features that are sound and right when formed of stone, but quite unsuitable for wood. This defect is seen more in early Gothic woodwork than in late, and even in early work it is generally associated with such beautiful carving that the weakness of it is easily pardoned.

The wonderful canopied stalls at Winchester, dating from the fourteenth century, show what I am speaking of, and it has occurred to me to contrast them with a piece of modern work at Westminster Cathedral designed by Mr. J. A. Marshall, which seems to me to show a very right method of treatment.

Of course tracery is quite right in woodwork when it is merely a pierced pattern cut out in a board and suggested by, but not imitative of, the stone windows and other tracery about it, but when it is treated with curved moulded ribs and with shafts provided with capitals and bases it is wrong in principle and can never be really satisfying in appearance.

There are many forms that are just as suitable to wood as to stone, and therefore properly decorative—as, for instance, the sunk joints often seen in old weather boarding. These were probably derived from stone rusticated joints, but they are constructionally right in wood because they serve to keep water from getting into the tongued joints.

Some of the best joinery work to be seen anywhere is to be found in the Halls of the City Companies—buildings full of character and charm, but comparatively little known except to the chosen few who are privileged to be members of the Companies or guests at their entertainments. They are hidden away in back lying places, but all of them are interesting and full of characteristic charm, and they are not difficult to gain admission to for inspection of their halls and court rooms.

One of the less known of the City Companies' Halls is that of the Stationers' Company behind St. Martin's, Ludgate Hill. A quaint old-world place in its external appearance and full of old associations. The Company used to hold the monopoly of printing the Bible, and the Bible is carved in many places on the fireplaces and other fittings; in fact, the arms of the Company consist of the Bible, the Glory, and the Dove, with the motto "Verbum Domini manet in eternum," and I believe that every apprentice bound at the Hall still receives a Bible and Prayer Book from the Company according to ancient usage.

The garden on the west of the Hall is the place where heretical books seized by the ecclesiastical authorities used to be burnt. Many of the meetings of the Revisers, when the Authorised Version of the Bible was compiled in the seventeenth century, were held at Stationers' Hall. The building possesses some of the most interesting joinery work of the seventeenth century that is to be seen in London, or, for that matter, anywhere else. Screen, panelling, fireplaces, doors, all carried out at the same time—in 1671—a few years after the Fire.

The woodwork in the Hall and Stockroom was made by Stephen College, "the Protestant Joiner" (in 1671), who, ten years later, was tried for sedition and hanged at Oxford.

"Brave College is hanged, the chief of our hopes,
For putting down Bishops and making new Popes."

The Stockroom was enlarged in 1887, but all the old panelling was re-used. The chairs in the Hall, made by Chippendale for the Company, are a very fine set.

Another Hall which is full of beautiful joinery work, is that of the Brewers' Company in Addle Street. The whole building is full of charm and old-world flavour. A fine

gateway entrance from the street with a great coat-of-arms over the door; a large old-fashioned court-yard with an external stone staircase leading up to the Hall on the upper floor.

The Hall screen is so curiously reminiscent of the one at Stationers' Hall that the same man must surely have been concerned with it, and as the dates of both are within a year or two of each other, this may quite probably be the case, although I believe someone named Wm. Whiteing was the person who actually received payment for it from the Company, or at any rate, for the work in the Court Room. There is a fine old inlaid table in the Hall that formerly belonged to the State Barge of the Company and a beautiful lead cistern in the kitchen. The Court Room has a very fine carved and inscribed fireplace, and most excellent panelling—more architectural in its design than is usual. There are carved divisions between the wide panels forming a kind of pilasters, and extremely well managed at the top so as to form an effective finish to the carving.

There are many other Halls that are well worth a visit and careful study—in fact, they form a most remarkable series of buildings, and are full of interesting pictures, wonderful plate, good furniture, and fine old embroidered hearse cloths.

If Sir Christopher Wren's remarkable plan for rebuilding London had been carried out, these Halls would have been placed as isolated buildings along a great quay by the side of the river, and they would have had an uncommonly fine appearance there.

Undoubtedly, however, the finest joinery work of all is to be found in the churches, and here it will be seen how important a part it played in the architectural design; it forms the gallery fronts, the wall panelling, the casing of the piers and bases, the reredoses, the great pulpits which are always such a point of interest in Renaissance churches; the entrance screens, the organ cases, the font covers, the pews: all are of oak and quite commonly of very rich and beautiful detail.

Such a thing, for instance, as the font cover at St. Stephen's, Walbrook, with its charmingly designed little wooden figures at the eight angles, is a perfect jewel of refined and delicate work in wood. Or the one at St. Nicholas Cole Abbey.

Font covers in all periods are among the best pieces of ornamental work in our churches, but it would not be easy to find any more skilfully designed than these. Is it not worth while to spend a Saturday afternoon or two in making carefully studied drawings of such things and learning something of the secret of their beauty?

The magnificent choir stalls and bishop's throne at St. Paul's, together with the organ and much else in the way of woodwork there, are beyond the scope of my present subject; they are among the finest things of their class in all Europe; we will glance at them and pass on to other matters more within our compass.

There are a great many fine organ cases in the churches of this City—in fact, very few that are not fine and interesting. One hardly knows whether to give one's attention more to the design of them or to the execution of the work. Both are admirable. The great rounded or pointed pediments and cornices, the brackets or corbels under the projecting turrets, the beautiful bands of pierced carving—but, above all, the fine proportion and the well-balanced composition of the various parts—all combine to make these organ fronts a most remarkable collection. They are very distinctive of this City and they are works that the City may well be proud to possess.

One of the finest is that at St. Lawrence Jewry, the church which is the official "parish church" of the Lord Mayor, and which possesses some of the most elaborate woodwork in London, but many others are very large and of fine proportion and beauty of detail, St. Stephen's, for instance, or St. Bride's, in both cases forming practically the west end of the church. These organs are in most cases at the west end, in the gallery over the entrance lobby, but sometimes they are found standing free on the floor of the church—never boxed in—in an organ chamber.

There are very few things in a church that give better opportunity for the exercise of design in connection with joinery work than an organ case, and as the actual construction of the woodwork from the workman's point of view is complex and interesting, I commend these organs to you for careful study.

There is another fine one at St. Nicholas Cole Abbey, which comes in as part of the general design of the west end with the doorways and other features.

Closely connected with the organ fronts are the vestibule screens that are found in most of the larger churches, and they are generally very well treated; sometimes they have fine fluted columns with well carved caps; sometimes there are iron standards connected with them (St. Clement's, Eastcheap). The doors in them have fine pediments over them; there are often coats of arms or panels giving the names of benefactors of the church or parish, and the glass sashes have the bars arranged in patterns. Often there are

CABINET IN HALL OF THE STATIONERS' COMPANY.

richly carved pews attached to the screens. There is a good example at St. Mary-at-Hill, by Billingsgate Market, where practically all the woodwork in the church is of a fine description.

The screen has carved posts projecting from it to carry the gallery, in which is a fine organ case. The gallery front itself is elaborately carved with rich panels and coats of arms. Some of the most beautiful iron sword-rests in the City are here, and the pulpit is of quite uncommon richness and completed with a fine staircase up to it, and an elaborate canopy. Balancing the pulpit, on the other side is a rounded reading-desk—again with a good stair up to it, furnished with carved handrails and twisted balusters.

There is a finely designed reredos of very large size and altogether more architectural in character than many others—well composed and large in scale—with very fine Corinthian columns, and the altar rail is of beautiful design, with wide carved standards and twisted balusters. The font cover is small, but well-designed, and the whole of the architectural treatment of the church is interesting and sound.

Even the smell of fish that pervades the church from the neighbouring market cannot destroy one's pleasure in the beauty of the building and its furniture. The bracket clock that projects from the east end of the church, high up and standing out boldly on a carved beam and pierced strut, is very well known, and is a fine model for a clock in almost any position, except where the L.C.C. imposes its idiotic limit of five feet in projection.

Close by this church is the old Gothic church of All Hallows Barking, which happily escaped the Fire of London, and which is full of charming seventeenth and eighteenth century woodwork. The carved pews at the west end with their pierced panels are a very striking feature. They are raised above the others and the backs are carried up to a great height to shut off the draught from the vestibule.

The same kind of pierced panelling runs across at the east end to form a kind of chancel screen, and it has thin, boldly projecting buttresses standing out at intervals to stiffen it. These have carved scroll tops of a very good pattern, and the screen forms a very interesting feature in the church. The pulpit and its great sounding-board are quite of the best kind, and the organ case, probably later in date than the other fittings, is very elaborately carved on the brackets and the cross fillings that enclose the pipes. These are in the characteristic pierced work, but on the curved cornice or pediment above are two large recumbent figures bearing musical instruments. There are square and round turrets of pipes, finished with fine, bold cornices, and the whole thing is a superb example of the joiner's art. There is a fine bold reredos, good in general effect and beautifully detailed throughout; the small panels, containing the Creed and Lord's Prayer, are charming pieces of detail. There is a most wonderful font cover and a good staircase to the gallery with thick, comfortable-looking balusters.

At St. Margaret Pattens, close to this church, there are two interesting raised pews adjoining the vestibule screen; not only are they richly carved, but they are furnished with flat canopies standing on brass standards, and giving them a very quaint and interesting appearance, and of course making them look very important. This church has a very fine oak reredos with gilded mouldings and carving.

Another good example of a vestibule screen is found in the charming little church of St. Mildred, Bread Street—a church which, like the last, is beautifully detailed. The woodwork and plaster work are most interesting, but there is also some good metal work, including a very fine brass chandelier.

There are only two of Sir Christopher Wren's churches that have chancel screens after the fashion adopted in Gothic churches, but one of them is a remarkably interesting specimen. It is now in St. Margaret's, Lothbury, but it originally belonged to All Hallows, Thames Street, and was presented to that church by Jacob Jacobsen, of Hamburg, probably a descendant of the German merchants who, under charter, formerly lived in that parish. At any rate, the eagle over the central opening is the emblem of the Hanseatic League, so that the giver of the screen evidently wanted to mark the connection of the church with the Hansa Union.

A very curious detail in this screen is the double spiral forming the mullions of it—a thing common enough in old candlesticks, but I do not know of any other example of its use on a large scale.

The other church with a chancel screen is St. Peter's, Cornhill, and here again the detail of the work is good, but not so uncommon as in the last instance.

While we are at the east end of the churches we may look at one or two reredoses, and in these, as in the organ fronts, we find extremely elaborate detail and often very fine workmanship.

Examples are at St. Martin's Church on Ludgate Hill, at St. Anne and St. Agnes, Gresham Street, and at St. Nicholas Cole Abbey.

In many of these reredoses there are good instances of the use of gold in decorating woodwork. Here in the City it is most valuable by reason of the prevailing gloom which makes it difficult to see the detail of the oak work in the present day. If it is used with judgment, sufficiently distributed, and yet not so slight as to be showy and vulgar, it helps the design very materially and gives it character and

quality. In some of the churches gold is used on the plaster work of the ceiling with most admirable effect, particularly, perhaps, in the case of St. Bride's Church—but there are other cases where it is merely tawdry and meretricious.

We might spend a long time in looking at all the woodwork that these City churches of ours possess in such profusion, but we will glance at a few of them without stopping for much description.

At St. Andrew's Wardrobe there are a fine west organ and a good gallery front and pews. St. Mildred's is a beautiful little church in which practically everything from the plate and the chandelier up to the vaulting and dome is charming, but the joinery work is particularly well designed and well made.

St. Nicholas', carving; St. Stephen's, carving; Christ Church, Newgate, carving. There are some big carved panels in this church that are, I believe, by Grinling Gibbons. They are very much like his work in the altar rails at Winchester. There is also a very beautiful litany desk. Good examples of panelling, internal doors, chimney pieces, and other fittings are to be found in abundance—many of them in the churches, many that I have not referred to in the halls of the companies, and many in offices and warehouses that were once private houses.

The vestry of St. Lawrence Jewry has some of the most costly and elaborate work of this kind to be found in this country. Not only is the carving so fine, but the framing and the mouldings are among the best examples in existence. The modelled work of the ceiling, too, is very good, and the painted decoration of the flat part of the ceiling is an excellent example of the class of work prevalent in the time of the Stuarts.

A few slides showing the woodwork in a house lately destroyed in Hatton Garden will illustrate very well the doors and other fittings that are characteristic of the work in London, and anyone who wants to measure such work can find in the South Kensington Museum the entire lining of a very fine room taken from Clifford's Inn. It is of the very best type of detail, and of course easily accessible.

The fireplace in the cedar room at the Skinners' Hall in Dowgate Hill is a very remarkable example. This room, or at any rate the wood for it, was provided by the old East India Company in recognition of the joint use they made of the hall. A good deal of gilding has been used with good effect, and some of the more elaborate carved work is done in mahogany. There is a great deal more of beautiful woodwork in this building, a fine oak staircase with balustrades on both sides; two or three well panelled rooms and another particularly fine fireplace. There are also four very good lead cisterns ornamented with figures representing the seasons.

I have two or three odd slides that you may care to see, although I have not time to allude to them in detail.

I might go on for a long while showing you pictures, but we have had enough for the present purpose. What I wanted to bring home to you was the extreme beauty of the woodwork to be found immediately around this spot; the great pleasure, and probably profit, to be gained by designing as well as making such things as I have shown you, and at any rate the great desirability of men who follow the craft of the woodworker making a close and careful study of such works as these. It is best done by measuring and drawing them to scale, and while you make a correct record of what is before you, you will be learning a good deal about how to design such work for yourselves, and to be far more useful to your generation than carpenters alone. You are already good workmen, but I hope you will become good craftsmen with a thorough knowledge of your trade, apt at arrangement and contrivance, and worthy followers of "Old Shish" who built the great ship in Charles II.'s reign.

ILLUSTRATIONS.

ORIENT LINE S.S. "ORVIETO."

WE this week have the pleasure of publishing views of another steamship which has been fitted up from the designs of Mr. A. N. Prentice, F.R.I.B.A., the "Orvioto" of the Orient Line.

COMPETITION DESIGN FOR THE USHER HALL, EDINBURGH.

WE illustrate the perspective view of the design submitted in the Usher Hall competition by Mr. Arthur J. Gale, F.R.I.B.A.

MOOR COT, BEN RHYDDING.

THIS is an architect's home, the house having been designed by Mr. W. H. Marten for his own occupation.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Architectural Association was held on Monday last at Tufton Street, Mr. Arthur Keen, resident, in the chair. The election took place of Mr. J. W. Brown, Bloomsbury Square, W.C., and Mr. E. H. Smith, New Southgate, N. The Hon. Secretary announced that the Fourth Spring Visit will take place on Saturday, March 18, when members are to meet at the offices of the General Accident Fire and Life Assurance Co., Aldwych (Mr. J. J. Burnet, architect). It was also announced that members' smoking evening has been arranged for March 24. A collection of drawings executed by English students in French ateliers and in l'Ecole des Beaux-Arts will be on exhibition.

Mr. A. R. Jemmett then read the following paper, entitled:

The Functional Application of the Orders to Modern Buildings.

Mr. President and Gentlemen,—The subject on which I have the honour to address you this evening is not one that I would have ventured to have chosen for myself, for it provides too many opportunities for so ill-informed a person as myself to give himself away most completely.

I should have thought that, as this subject has a certain scholastic or academic flavour, it might have been better handled by someone who has had the advantage of our recently-improved system of education, or by one associated with the initiation or carrying out of that system, or, failing either of these, by the person who is responsible for suggesting the title. As, however, the duty has fallen on me, I will do the best I can, hoping that the discussion will bring out ideas and information of more permanent value from those better qualified to speak.

On thinking over the wording of the title—"The Functional Application of the Orders to Modern Buildings"—it seemed evident to me that the accent should be placed on the word "functional"—the application of the Orders in such a way as to fulfil a function.

Now, Sir, we are all aware that some people may question the legitimacy of the whole proceeding; may contend, with much show of reason, that you cannot rationally apply the Orders to modern buildings—whether functionally or otherwise—particularly in this country, where Classic architecture is only an imported plant. Such people may well hold that the Orders, as perfected by the Greeks, were a natural production of the time and circumstance; that they were suitable to that time and those circumstances only; that they were applied by the Romans indiscriminately and without any real understanding—sometimes rationally, sometimes irrationally; that where they applied them functionally it was as much a matter of accident as of design; that the same remarks apply to the period of the Renaissance, which, as a matter of fact, was a fundamental mistake turning architecture from the true path of progress and keeping it there ever since.

This is a point of view for which I have the greatest respect, but it is not the subject for discussion this evening. Obviously, also, it would be most inconvenient to admit it here, as the admission would bring this inquiry to an abrupt termination. I will merely refer those who hold it to the dictum attributed to M. Duc, Grand Prix de Rome, and architect of the Salle des Pas Perdus of the Palais de Justice at Paris: "There is no architecture without the Orders"—just to remind them of another point of view, and leave them to make what they can of it.

It seems necessary for our purpose to consider Classic architecture as much an acclimatised or naturalised citizen as a Lombardy poplar, a French partridge, or a Jersey cow; as much a home product as a Brussels carpet or a French casement; and to grant the legitimacy of the application of the Orders, provided they are applied in such a way as to perform a function. What are these functions? And how may the Orders be best applied so as to fulfil them? These seem to be the questions before us to-night.

It is, I suppose, the orthodox standpoint that, as architecture is a structural art, the chief function of each individual feature is a structural one. It is, I believe, contended that no feature has a right to exist except in discharge of some structural necessity, and that its value as architecture depends on the degree of success with which it exactly fulfils that function.

Far be it from me to deny this, but I venture to suggest it is true only as far as it goes. The truth perhaps, but not the whole truth.

If we consider for a moment the use of the Orders as elaborated by the Romans, and again by the later Italians,

we must admit that they often applied them in a way that was not strictly structural—as, for instance, in the Coliseum, with its concrete structure faced with superimposed tiers of applied Orders in stone—or in any colonnade with its intercolumniation too wide for the depth of its architrave.

Here we get features which are not exactly structural. The architrave, for instance, does not bear as a lintel from column to column as it would have us believe, but either includes the frieze in the same stone to get depth for the bearing, or else is jointed like an arch. When we remember that such features are to be found in most of the buildings since the time of the Greeks, where the Orders have been applied, we realise that, if we are to adopt the standpoint that the function of every feature is structural and structural only—if we take a strict view and refuse to admit any feature that is not an absolute structural necessity—it is evident that our use of the Orders will be extremely limited, and that there is very little scope for their application to modern buildings.

I would venture, then, to put forward the point of view that, although the chief function of every feature may be structural, yet it may perform other functions equally necessary to the completion of the building as a work of art. For we must remember that the structure of a building has not only to serve a practical purpose, but also to express that purpose in its general appearance. That although this purpose may be—indeed must be—to some extent expressed in the general lay-out and grouping of its structural masses, yet this expression is not complete. These masses have to be shaped, modelled, and decorated, to draw out, heighten, and complete that expression. For although the general arrangement and structure of the building may, after examination and critical analysis, prove satisfactory to the mind, yet it has to appeal through the heart to those not capable of this analysis; and to those who are capable it has to make its appeal with a swiftness that does not allow time for conscious analysis—an instantaneous, instinctive, emotional appeal which subsequent critical analysis should only confirm.

If this be so, then the features employed in this process of drawing out and accentuating the expression already inherent in the general lay-out and structural grouping, to obtain this instantaneous emotional appeal, are performing a function, not altogether structural perhaps, but none the less necessary. If we use the Orders for this purpose we may, I think, be said to be applying them functionally. It is in this way that they were used by the Romans and the architects of the Renaissance.

If we endeavour to elaborate and illustrate this point of view we perceive that the Orders may be applied in many ways, all more or less functional; that it is possible for an Order to fulfil a structural function without necessarily fulfilling an expressive one; or an expressive but not a functional one, or both, or neither, and that their value varies accordingly.

For example, the main entrance to a large public building may need a porch or outside shelter, and for this purpose an open portico with columns and pediment may be erected. Here the Order may be so constructed as to fulfil its structural function, while at the same time the whole portico may serve to express and accentuate the entrance, and this expression may be more exactly obtained by the treatment of the detail and decoration of the Order in harmony with the purpose and character of the building.

In this case the Order seems to serve the functions both of structure and expression, but if the same portico is taken from the entrance and placed at random against some other part of the building where it serves no practical purpose, the Order, no doubt, may still be so constructed as to serve its structural function of supporting its own roof, but it no longer fulfils the function of expressing the arrangement and purpose of the building. In fact, it has become a misleading feature, confusing the expression, however structurally perfect it might be in itself.

Again, we all know the usual arrangement of a small group of municipal offices. Offices on the ground floor with a central entrance, Council-chamber on the first floor over the entrance, with smaller committee-rooms on either side. Where the Council-chamber and committee-rooms are given a height in proportion to their relative sizes, we get a structure which by its arrangement and its general grouping and outline expresses up to a certain point, simply by these means, the character and nature of the building.

If, then, it is proposed to intensify and complete this expression by the application of an Order to the Council-chamber, and perhaps a secondary one to the committee-rooms forming the wings, so as to emphasise the fact that

these are the important rooms, the Orders seem to perform a function of expression, and therefore to be legitimate, even though they are not required structurally. If, however, the actual columns or pilasters are not just applied to a wall already sufficiently strong, but form part of the wall itself, and are actually necessary for the support of the roof, being so spaced as to take the roof principals, they seem to perform a structural function also, and have a greater value still as a means of expression, for they tell us more of the nature of the building. Arranged irrespective of the construction they tell us something, and so have a certain value; arranged to express the construction, they tell us more, and so have a greater value.

But the point I wish to emphasise is that even if they perform no actual structural function they may be used as means of expression in places where they are not a structural necessity provided they are used in conformity with the laws of architectural expression.

This seems to be the important point. The first thing necessary is to put the Order in its right place in the composition, where it expresses the right thing. If it is also structurally applied, so much the better, but this is a secondary consideration. An Order performing a structural function applied in the wrong place, where it emphasises the wrong thing, confuses the expression of the building as a whole, and is worse than useless. In such a case its structural application does not interest us much. If on approaching a public museum we see a grand portico with pediment, and, taking this for the main entrance, we mount the flight of steps only to find ourselves confronted with a blank wall, or with a small door marked "Private" leading to the offices, it is no comfort to us to reflect that the Order has been applied to fulfil the structural function of carrying its own roof. As we wander round the building in search of the entrance we are in no mood to admire its structural perfection. All we feel is that we have been taken in shamefully, and that we want the front door. Later on we may find time to reflect that even structural perfection itself is no good in the wrong place, and that the whole thing is a false idea and just a waste of so much good stone and honest craftsmanship.

The use of the colossal Order rising through two or more floors, a treatment which is just now so popular, is rather a difficult matter to handle. You can look at it in so many ways. As a method of expression it looks utterly false at first glance, but, after all, there is something in it. There are other things to express besides the obvious physical fact that the building is divided into several storeys.

Suppose you have to supply an acre of accommodation for some commercial purpose, the whole of the accommodation being of the same character throughout; and suppose the most convenient way would be to arrange it all on one floor. If the site is large enough you would do this, but if it is only a third of an acre you have to divide it into three and place three floors one over the other.

Now you do not do this because it makes a better or more convenient arrangement; quite the contrary. You do not do it because you want to, but because you have to. It is not the strong point, but the weak point of the design; you therefore do not want to say too much about it. It is a fact to be frankly recognised but not unduly emphasised; you do not want to make a song about it. If, then, instead of emphasising each floor with a small Order you include them all in one large one and express the floors with the windows and other subordinate features, you get obvious facts frankly recognised without undue emphasis, while the large Order, by its scale and treatment, seems to convey a truer suggestion of the unity of the building as a whole, and the nature and relative importance of the commercial concern of which it is the expression.

If, however, the three-floor treatment is a vital necessity of the arrangement—a characteristic feature of this class of building—it would then be proper to duly emphasise the fact by boldly marking the three floors. To do this with an Order for each floor would perhaps be logical, but as a method of expression it seems rather crude and a needless elaboration of the obvious.

If we use this large Order, let us take care that we mean something by it, that it is suggested by the nature of the building, and not by the present tendency to bigness of scale. Rightly used, it seems to be a most flexible medium by which we can draw out from the building the most subtle shades of expression; wrongly used, nothing can be more misleading or better adapted for confusing expression.

Imagine a building of four storeys all of the same character and importance, where there is no reason for accentuating one rather than another. To treat the ground floor

as a basement to an Order rising through the first and second, and then to put the third in the attic, may produce a pleasing but most misleading effect. But if the different floors have each a separate and distinct character—say the different departments of a Government office—and there is something in the nature of the first and second to suggest that they be coupled together and emphasised, there seems no reason why this should not be done with an Order.

There are many other points, such as the expression by means of a large Order of a hall set back from the front and masked by several floors of small rooms, which it would be interesting to examine if the time at our disposal permitted.

As this paper is not intended to be a study in architectural expression, I will content myself with the suggestion that the principal value of the application of the Orders to modern buildings, taking into consideration our rapidly changing methods of construction and complicated practical requirements, is chiefly as a means of artistic expression; that used in this way they fulfil a function.

The principle that seems to guide us in their application is that they must in all cases obey the laws of architectural expression, and that a right method of expression is the essential thing. If in so doing they can also fulfil a structural function so much the better, as the expression becomes more complete. They cannot, however, be applied to serve a structural function in defiance of the laws of expression—for the expression, not the construction, is the essential thing.

Perfection of mechanical structure is satisfying only to the mechanic. If it satisfies us, why use the Orders at all? The expression inherent in the structural masses of the building, before the Orders were applied, should be sufficient.

After all what is it we would be at? We are artists, not mechanics. Our aim is not perfection of structure, but perfection of expression. We may need one to obtain the other, but if we strive for perfection of structure it is not for its own sake, but simply as a means to perfection of expression.

I am well aware that in recognising the application of the Orders as an added decoration not structurally required I have laid myself open to the charge of holding the now discredited theory that building and architecture are separate things—that architecture is the decoration you apply to a building, or, as I have lately seen it expressed building + ornament = architecture.

If I repudiate the suggestion now it is not so much from the desire to forestall criticism as to direct the discussion to more profitable issues.

But, after all there is something in this point of view—there generally is in every point of view—even, I trust, in mine. To me this old, unhappy, far-off heresy, which I treated to-day with so much contempt by our superior persons, was but a superficial way of expressing a partially comprehended truth.

The artistic expression that is inherent in the lay-out and grouping of the structure not being recognised or understood it was natural that the whole of the expression in the finished building should be thought to be entirely due to the shaping or decorating of the structure which takes place when we proceed to intensify and complete an otherwise imperfect expression. The Orders which we may happen to use for this purpose are not in themselves the architecture. They do not create the artistic effect, they only serve to perfect it, and in so doing they seem to me to fulfil a function.

The following notes by Mr. R. Phené Spiers on Mr. A. R. Jemmett's paper were then read:—

The subject which was suggested to Mr. Jemmett to take up is much too vast to be discussed properly in one evening, and I propose to take up two points only in this paper. Firstly the dictum attributed to Monsieur Louis Duc, "There is no architect without the Orders." I do not know where he said it or what the preamble was, but I do not think that the students in England recognise the extent to which the study of the Greek and Roman Orders is pursued in the Ecole des Beaux-Arts. It used to be the custom when I was studying in Paris in 1860, and it may still be continued, to give once a year what was called the "*Projet de l'Ordre*." This consisted of some subject for design, in which one or more of the classical Orders was to be applied. I say, or more, because I recollect that the first subject I had to take up was a design for two bays of the courtyard of some Government offices, in which the superposition of the Doric and Ionic Orders, with arcades between, were to be embodied. Two months were given to work out the design, and I remember that I made myself acquainted with every example known, from the Theatre of Marcellus and the Colosseum to the numerous courtyards in the Italian palaces. The second subject in the

Following year was for an Odeon or music hall, with a peristyle round the exterior and a portico on the front to be of the Greek Ionic Order. Here, again, I made a profound study of every Greek temple of which diagrams had been published, and as parts of the building rose above the peristyle and portico, these had to be designed in accordance with the style, which necessitated a rough research into the various accessory buildings of the sacred enclosure, in order to find "motifs" for my design. It was probably to this purpose of study that Monsieur Duc referred, and his view was that a student should make himself the master of the Orders instead of remaining their slave.

The other point in Mr. Jemmett's paper is the reference made to the use of the colossal Order rising through two or three floors: generally speaking, the problem is solved by stipulating the masonry of the ground storey, so that it makes a solid and suitable base to carry the large Order above; if, crowning this, there is either an attic storey, or, as in Somerset House, a lofty balustrade, the relative heights of these three sub-divisions give scale one to the other; one of the chief difficulties to be met with in this combination is the undue height of the entablature of the great Order, which would be a quarter of the height of the complete scheme—viz., including capital and base. This great height tends to interfere with the lintel of the second or upper floor window and the cill of the attic window, and there are some buildings in London in which the architect has cut through the architrave with a window, and utilised the frieze as the supporting member of the cornice. This is a mistake; the architrave is the correct supporting member, but the frieze is only a decorative feature which might be omitted.

There was no frieze in the Ionic temples of Ionia, but when the Attic Greeks introduced the Order into the Eretheion they omitted the Ionian dentil bed-mould, and in order to get sufficient height for the ceiling beams of the east and north porticoes were obliged to introduce a frieze, and this was necessarily carried round the whole temple; they omitted the frieze, however, in the entablature of the Caryatide portico. The omission of a frieze when a colossal Order is employed would lessen by about one-third the depth of the entablature.

There is still another treatment of the subject which was employed by Mr. R. Norman Shaw in the New Zealand Chambers in Leadenhall Street. Now, Mr. Norman Shaw is the grand master of fenestration, and when he was called on to design this building, he recognised at once that in this comparatively narrow street more light could be obtained up and down the street than from the side opposite. He therefore applied for permission to project some oriel bow windows. He was told, however, this was not possible, but if he liked to set back his front then he could project his bow windows. This his clients objected to, so he asked that proportion of the whole front would have to be in solid brickwork. I think he was told one-third. This he contrived in four great piers, and a part of the ground storey, and between these piers, and about 2 feet to 2 feet 6 inches back—viz., the required projection for his bow windows—he sketched in these features and took his design again to the Metropolitan Board of Works, and obtained permission, provided the woodwork of the windows was kept $4\frac{1}{2}$ inches behind the front of the piers. This regulation is now given up, but in 1873, when this building was erected, all window frames had to be set back $4\frac{1}{2}$ inches and in recessed jambs, because sometimes when in a Queen Anne building, where the frames were flush with the wall, if a fire took place they fell out and injured the firemen. These various inquiries led to the design of the New Zealand Chambers, which are not only the best lighted premises in the City, but the grandest and most impressive in design of any of Mr. Norman Shaw's works. These great piers rising from the ground to the main cornice have the same dignified aspect as that which is given by the employment of the colossal Order, but at all events in this case, Mr. Jemmett's statement that it results in a "pleasing but most misleading effect," certainly does not apply. I would suggest therefore that our students should make a point of going down to Leadenhall Street, now that I have told the story of the conception of these New Zealand Chambers, to see how certain regulations and requirements may sometimes result, in the hands of a master, in an original treatment of the whole subject. As a matter of fact, I believe the bow windows are not in wood, but in iron, so there is no fear of their falling on anybody's head.

Mr. ALAN SNOW, in proposing a vote of thanks, described Mr. Jemmett's paper as a particularly interesting one, inasmuch as it dealt with a question which required to be ventilated at the present day. In two Roman Orders the

arch should be included in the Order because the entablature was designed in conjunction with the arch. Mr. Jemmett rather seemed to think the application of the Orders as the only possible method of emphasising portions of a building. But not every one would agree with that view. In considering the subject it was extremely necessary to get fixed in one's mind what is an Order and what is the function of an Order. To his own mind an Order was not a structural feature at all, but rather the clothing of that structure, the expressing in a true and beautiful form of the function of a structure.

Mr. HERBERT A. HALL remarked that what was useful for them to discuss was the application of the Orders to modern buildings. Two interesting examples of their use in different ways by Mr. J. J. Burnet were in the British Museum additions and in the offices of the General Accident Fire and Life Assurance Company, Ltd., in Aldwych. But the application of the Orders got people who attempted it into all sorts of trouble. Unless one could use them in a rather noble way it seemed better to leave them out altogether, though there were obvious occasions for introducing them to advantage. For instance, where a lot of floors were one above the other the Order employed on the facade rested the eye, pulled the whole front together, and indicated that the top floor was as good nowadays as the bottom. In conclusion Mr. Hall spoke of the value of such a paper in affording those present an opportunity to air the troubles they came across every day in the offices and also to see if they were thinking about things on a little higher level than they were actually working on.

Mr. CURTIS GREEN referred to Mr. Spiers' saying that architects ought to be masters of the Orders and not their slaves. It seemed to him the dictum attributed to Monsieur Duc would read better as "There is no architect without the Orders." All the men doing good work to-day were undoubtedly masters of the Orders. He thought a great mistake would be made if they gave up drilling themselves in them at that time of their life when they ought to be drilling themselves in something. It might, however, be advantageous if there was a dictator in art who would lay down a rule that no three-quarter columns and no pilasters should be used for ten years.

Mr. A. G. R. MACKENZIE thought that if an architect could always remember that a piece of architecture was like a piece of poetry, and that the architect had the same license as the poet to emphasise those parts to which he wants attention drawn, then he would not go far wrong in their proper use. If, on the other hand, he employs an Order without thinking of the expression, then it is much easier to go wrong. There could be no doubt that nothing emphasised any part of a building so much as the introduction of columns.

Mr. R. JONES thought that the whole subject of town architecture resolved itself into a question of fenestration, for it was by the grouping of the windows that the character of the building is expressed. The Order, being a very rich and precious member, should not be used indiscriminately, but rather kept for some important post such as emphasising a doorway. Then there was a danger of, so to speak, repeating an Order "ad nauseam," for by duplicating it one loses its value. It was a pity that so many men nowadays are making use of the unsuitable colossal column for London street architecture. If greater attention were paid to the grouping of windows, especially where the materials are not very costly, there would be much finer results.

Messrs. V. R. TALVAKER, ALAN L. SNOW, and D. A. FORSTER also joined in the discussion.

Mr. ARTHUR KEEN, the president, in conclusion, said he wished to propose a joint vote of thanks to Mr. Jemmett and to Mr. Phene Spiers, the former for his paper and the latter for his notes and for the loan of the drawings hanging on the screen. He for his part had always wondered what the Greeks would think and say if they came back to earth and saw how their Orders were used. They would probably be entirely non-plussed. The Greek use of them seems the only way that is sound, though we have got accustomed to the modern way. It was difficult to see how it could be right to apply columns to a wall and make them part of it. Mr. Jemmett in his paper had treated the Orders as if it was a matter for æsthetic expression and not for construction at all; and that was the only way their use can be defended.

Mr. A. R. JEMMETT, in replying to some of the points raised, said that we have to have structural perfection for its own sake. It is something that a builder may do and is not architecture. The building begins to be architecture when it is so arranged as to express human emotion. A row

of columns is not architecture and means nothing. The mere arrangement on plan is the first method of expression. When that arrangement expresses the idea desired, then comes the decoration. If expression were not the one thing architects were after they would cease to exist as such, for they would all be engineers. There were undoubtedly many other ways of giving expression to a building besides the use of the Orders. The point was that if an architect uses them he ought to do so in a way that expresses something of the character of the building. If the Orders are put into a London shop front they give it too much importance, for they ought to be reserved for public buildings or special sites like the intersection of streets. Finally architects should remember that as impersonal artists it is their duty to express not their own character, but the character of the building.

The next meeting of the Association will be on March 20 (combined meeting with the Camera Sketch and Debate Club), when Mr. A. N. Price will read a paper entitled "The Legal Authority of the Architect as an Agent."

ROYAL ACADEMY LECTURES ON ARCHITECTURE.

THE third of the course of lectures at the Royal Academy by Professor Reginald Blomfield, A.R.A., was delivered on Monday, February 27, when he dealt with "Church Building in France in the sixteenth century, the end of Gothic Architecture."

Neo-Classic architecture in France established its predominance in civil and domestic architecture much quicker than in the churches. The attitude of church builders, said Mr. Blomfield, was one of strong and tenacious conservatism. Long after the details of Gothic had been abandoned the traditional plan and even construction was adhered to. That there was no real life in it is shown by the gross and irrational details into which it ultimately degenerated; but its survival was so general throughout France in the sixteenth century that no account of the architecture of that period would be complete without some reference to this last flicker of mediævalism.

New churches were comparatively rare. Just outside the south-eastern corner of France an entirely new church and monastery was built early in the sixteenth century, viz., the very remarkable church of Brou, near Bourg, in the south-eastern corner of Burgundy. In 1513 Margaret of Austria made an agreement with Louis van Boghem, of Malines, to design the masonry of a memorial church to her husband and to superintend its construction at a salary of 500 livres a year. The work was completed about 1530. Van Boghem put in a claim for 4,034 livres as arrears, but he only received 1,500 livres. He was evidently the designer as well as the builder. Both in general design and in details he adhered strictly to late Flemish Gothic of a rather peculiar kind, for the design is curiously unequal. The west facade is about as bad an example of Gothic as it is possible to find. The interior is well lit, quiet and dignified, and the choir is extraordinarily attractive in the spacious simplicity of the general treatment, acting as a foil to the exquisite delicacy of its detail. The important figure work in the three famous tombs was executed by a sculptor of Brussels who was partly but imperfectly Italianised.

The church at Brou was perhaps the last complete effort of pure Gothic in France and its borders; though a great number of additions were made to older buildings. Throughout this century there were two currents of thought, sometimes combining in imperfect fusion, more often directly antagonistic. The master builders were by no means disposed to abandon their familiar methods in favour of the new ideas introduced by the Italians and strenuously advocated by the new generation of architects. Where no architect such as De l'Orme was employed the tendency was always to slip back to the older manner. Political conditions were undoubtedly against the spread of the new manner in church building. The Huguenots were mainly iconoclastic, and the Catholics clung to the architecture that had for centuries given expression to their ideals. In fact, it was not till the return of the Jesuits in 1603 that an entirely fresh factor came into play.

The church-building of this sixteenth century falls into three main categories: (1) Churches, such as St. Gervais at Gisors, where designs for the facade on a comprehensive scale were attempted; (2) survivals such as Carnac, which curiously suggests the Laudian Gothic of certain Northamp-

tonshire churches; and (3) churches such as St. Eustache and St. Etienne du Mont at Paris, where, though all the detail is Renaissance of a sort, the informing spirit is still unmistakably Gothic. The cathedral or church of St. Gervais at Gisors is a most difficult problem. Not only is the work of the interior of different dates, but outside three separate and distinct attempts to remodel the whole west facade were made. The survivals of Gothic in France are even more curious than they are in England. The church of Carnac, for example, is an extraordinary mixture of styles, and is a typical instance of what was habitual in provinces remote from Paris. There are many others scattered about Brittany, which show the invincible tenacity with which the Bretons clung to the tradition of their forefathers and a curious barbaric instinct in design utterly alien to the temperament of the Frenchman of the northern centre.

There are churches of some historical though no great architectural importance, in which the old and the new meet with curious results. Renaissance detail of a sort is used throughout, and yet in the general treatment there is a throw-back to the motives of much earlier work. The new manner was used for details, but had in no sort of way penetrated into the heart of the design. In the church of St. Pierre at Auxerre there is not a single mediæval moulding, and yet the plan and organic idea of a church is so faithfully followed that the impression at first sight is that of a rather fine Romanesque church with later additions. When the elder Gabriel built the west front and the south transept to the Cathedral of Orleans, in 1706, he adhered to the main lines and general forms of Gothic, though totally ignorant of the mouldings, detail and whole spirit of Gothic architecture.

Of the churches where the detail is neo-Classic but the whole conception is Gothic, St. Eustache at Paris is the most famous example. It shares with Brou the distinction of being the only important church built "de novo" in the sixteenth century. Pierre Lemercier, who began it in 1552, evidently intended to show what could be done with a church in the new manner; but he never got within the fringe of the subject, and in fact produced an immense Gothic church in spite of the lavish details and ornament with which he covered his building. St. Eustache is impressive by its size, but it is an unsatisfactory building inside and out. Lemercier had little or no idea of organic design. St. Etienne du Mont at Paris has many of the defects of St. Eustache, but the interior is light and cheerful, and the church is generally more attractive, possibly because it was less ambitious. It is typical of what that composite person the mason-sculptor-architect could do at the end of the sixteenth century. All that is good in it belonged to the last of the mediæval tradition, the rest was mere groping after a new manner of thought and expression not really understood by the workman and still repugnant to his instincts. It is wrong to treat such men as Lemercier, the Le Breton or the Grappins of Gisors as architects at all. The results of their ignorant experiments were very much what a builder left to his own devices might produce at the present day. They trusted almost entirely to detail, but the detail was shot into their buildings without any consideration or even consciousness of its architectural value. In both cases tradition is as yet wanting and in both cases is the reason why architecture has gone so lamentably astray. Moreover architecture no longer expressed the ideals of the time. I failed, said Mr. Blomfield in conclusion, to provide the right background and environment for those complex conceptions of life and religion and that new point of view which carried a new manner with it in inevitable consequence.

MANCHESTER SOCIETY OF ARCHITECTS.

ON Wednesday, March 1, Mr. W. A. Forsyth, F.R.I.B.A., read a paper which was entitled "Notes on the Preservation of Ancient Buildings." The lecturer opened by remarking that the preservation and restoration of old buildings is an important subject for the attention of architects. When the opportunity occurs, architects must not always be ready or skilled in the treatment of the problem. Conservative methods are at all times necessary, imported material always unhappy, and native material invariably satisfying.

Mr. Forsyth then proceeded to speak of the principle that should be observed in the renovation of an average village church or manor house. First, as to what should be preserved. All that is fit and sound, apart from con-

derations of taste and fashion and often of convenience could be retained. It is always possible to make full use of a mediæval church for purposes of worship, and it is no hardship to adapt one's mode of living to an old house. The Town Planning Act respects ancient monuments, even if a good scheme is interfered with by the position of an historic building.

Second, as to the means of carrying out the actual works, restoration should have enduring qualities. It is pathetic to see the Victorian restoration of an historic London church renewed at this early date. All works should be given ample time in execution. Accurate drawings of the building should be made, showing all the irregularities. And he advocated the use of freehand drawings. A ruled plan cannot be accurate. The specification should be complete in every detail, and photographic records are valuable. Orders should be avoided. He knew of no more satisfactory method than a 10 per cent. profit arrangement.

Coming to the actual operations, Mr. Forsyth dealt in turn with each part of the work. Rubble walls, he said, are largely misunderstood to-day. It is usual to point them, but as a rule no pointing is required, except in the dire extremity of the solid materials having become loose. The difficulty of making either plastering or pointing adhere to rubble is not realised. There are three distinct schools in the preservation of stonework to-day. The first might be called the "lime-washers." There is strong sentiment amongst them against attempting to repair in the actual form and material of the original; if a stone mullion is crumbling, it is repaired with brick or tiles, and the place smeared over with mortar. They are anxious that their patching should reveal itself for all time. To a certain extent this school is justified by the glaring results of the second, the "replacers," whose entire creed is to "cut out and replace with new to match." The third school is that of the "fakers," whose delight is to deceive, and to remove all evidence of renovation. It is difficult to say which process is the most desirable. Mr. Forsyth proceeded to give instances of each method. At Westminster, a great work of "lime-washing" is being carried out by Professor Bethaby, the decay of the stone being arrested by the application of limewash; some colouring is utilised to assimilate the applied material to its environment.

The use of the same methods of construction as obtained in the original building was advocated, such as the cutting of the mouldings on groin ribs in situ. After dealing exhaustively with the use of wrought iron tie rods, and warning architects against the use of metal in association with stone, concrete, or brickwork, Mr. Forsyth spoke of the treatment of roofs. Machine made tiles should be entirely excluded. English oak, he said, is the only timber. In repairing old roofs, all work should be done in position to avoid the taking down of old rafters, tie-beams, and girders. Old seasoned material should always be employed. In plastering, slow setting limes should be used.

UNIVERSITY OF LONDON LECTURES ON ARCHITECTURE.

The subjects of Mr. Banister Fletcher's lecture at the British Museum on Tuesday, February 21, were the palaces of the Roman Emperors, the houses of the Romans and Pompeian Art.

Augustus built his palace, with the Greek and Latin libraries to the south of the Palatine Hill, the former site of the ancient Royal palace. After the time of Theodoric the Goth, the "House of Augustus" fell into ruins and became the property of the Church. The first excavations on the Palatine Hill were made during the laying out of the Farnese Gardens by Pope Paul III. in 1534-1550.

In 1721 to 1730 further excavations brought to light many works of art which were removed to Naples and Parma. In 1861, under Napoleon III., who bought the Farnese Gardens, the work was undertaken systematically by the architect Pietro Rosa, and continued later by the Italian Government when they acquired the Gardens in 1870. The digging revealed a group of magnificent palaces which had been planned on axial lines producing beautiful vistas; hemicycles and columns cleverly disguised any irregularities caused by additions made at various times, bringing the whole into symmetry and harmony, a system which is frequently adopted in modern architecture.

In the year A.D. 14 Titus had built another palace north-west of the Palace of Augustus. Caligula enlarged this building considerably and Titus and Domitian re-erected

State apartments to the south-east. Septimius Severus added the portion south-east of the Stadium of Domitian, of which remains exist.

The Golden House of Nero was not built on the Palatine, but on that portion of the Esquiline Hill where the Colosseum and the Baths of Titus were erected by the Flavian Emperors as an offering to the people to atone for the theft of land made by Nero in order to build his palace, which was a mile in length and one of the most gorgeous buildings ever known. It contained works of art from Greece, Asia Minor and Egypt. It was built after the Great Fire of Rome in 65 A.D., which lasted for nine days.

The interior was decorated in the most lavish way with gold, precious stones and ivory, and the banqueting-room, which was circular, had walls made to revolve by machinery in imitation of the heavens. The palace was destroyed by Vespasian and Titus as a matter of policy, and the buildings mentioned above erected on its site.

But with the destruction of Nero's Golden House, the want no doubt was felt for State apartments which the Palace of Domitian supplied. This palace was on the Palatine Hill, reached by the roadway from the Arch of Titus. A flight of steps led to a portico of Cipolino columns.

The throne room or tablinum is to the north of the central peristyle; it was 150 feet long by 120 wide (40 feet wider than the nave of St. Peter's), and covered with an intersecting vault. An apse for the Emperor's throne faced the entrance and two other openings from the peristyle flanked it on either side.

The lalarium, which contained the altar and statues of the household gods was east of the tablinum, to the west was the basilica, with aisles in two storeys, and a semi-circular apse having marble seats and crowned with a coffered semi-dome. The church of St. Agnese Fuori le Mura is very similar to this basilica. The peristyle is 175 feet square, surrounded with marble columns.

The triclinium or dining-room is to the south, with a nymphaeum adjoining, the walls of which are lined with marble and the central oval fountain still in situ. It probably had a central opening for light and contained flowers, fountains and running water, forming a delightful arrangement for a State banqueting-room.

The Palace of Diocletian at Spalato was next described by the lecturer. The Emperor Diocletian was born at Salona, four miles from Spalato. He was made Emperor A.D. 284, and in the following year he began to build the Palatium, from which Spalato takes its name. In 305 A.D. Diocletian abdicated and resided at Spalato until his death in 313 A.D. From 313 to 639 the place remained unoccupied save by refugees from Salona who had been driven out by the Goths and Croats.

In 649 Pope Martin appointed Giovanni di Ravenna as first Bishop of Spalato, and the Temple of Jupiter (or Mausoleum) was converted into a cathedral. From 806 to 1812, when finally the town became Austrian property, it was occupied successively by the Franks, Venetians, Hungarians, Neapolitans, Croats and Turks.

A great portico or gallery, 524 feet long and 24 feet wide, extends the whole length of the south front of the palace, which faces the Adriatic Sea. The whole covers an area of 9½ acres, measuring 592 feet to the south, 570 to the north, and 698 east and west. There are three entrances guarded by octagonal towers and leading to two colonnaded streets which divide the whole area into four parts as a Roman camp; the two northern parts were devoted to the courtiers and women's quarters, and the southern part formed the Imperial residence.

The principal entrance is by the north or Porta Aurea (the Golden Gateway), the eastern entrance is by the Porta Ænea or Brazen Gateway, and the western entrance by the Porta Ferrea or Iron Gateway.

The palace consisted of the Imperial residence, the vestibule, atrium, basilica, baths, private apartments, Temple of Æsculapius, and Temple of Jupiter, thought to have been the Mausoleum of Diocletian.

This building is one of the first examples of the decay of Roman art, as a square-headed flat arch covers the opening of the Porta Aurea, over which the entablature is bent round in the form of an arch, thus losing its structural significance. The wall surface externally is arcaded with semi-circular arches supported by small granite columns having Corinthian capitals. The columns are supported on corbels and the arches spring direct from the columns, suggestive of the Gothic principle of later years.

Hadrian's palace, near Tivoli, the House of the Vestals, and examples at Pompeii were also discussed.

ARCHITECTURAL CRAFTSMEN'S SOCIETY, GLASGOW TECHNICAL COLLEGE.

At a meeting of the Glasgow Technical College Architectural Craftsmen's Society, held in the College on March 3, Mr. James S. Boyd, Licentiate R.I.B.A., read a paper entitled "A Study of French Architectural Masonry." The organisation of the workmen in and the management of a first-class masons' yard in Paris was described and compared with similar yards in this country. Over one hundred photographic slides, showing the construction of domes, vaults, skew-bridges, &c., in Paris, Versailles and Rouen, were exhibited. The speaker stated that the boldness in French masonry construction was traditional, just as caution or lack of boldness was traditional in British work. In concluding, the opinion was expressed that architects in Britain should be trained to thoroughly master the practical application of geometry to building work, so that they (as master-craftsmen) may assist the actual workman in solving any intricate constructive problem that may arise in the carrying out of the design of the master-mind.

GLOUCESTERSHIRE ARCHITECTURAL ASSOCIATION.

The President (Mr. Walter B. Wood) occupied the chair at a meeting of the Gloucestershire Architectural Association held at the Northgate Mansions on Thursday, February 23, when Mr. L. Richardson (Hon. Fellow) gave an instructive lecture on "Brick Earths and Brick-making in Gloucestershire."

Mr. Richardson, in the course of his lecture, described the various ways in which bricks might be made, either by the slop process, semi-plastic or plastic processes. The slop process was that which was adopted in the Severn-side brick-yards; the semi-plastic at Robinswood Hill; while the plastic was that most generally used in Gloucestershire. He next described the various brick earths available in the county, and said that a loam was the best natural earth. It, of course, was composed of sand and clay, but very excellent bricks could be made by mixing and grinding together sand and "strong" clay. This was done at the Battledown Works. The sandy beds that crop out in the lower portion of the slopes of the Cotswolds afford the best natural brick earth in East Gloucestershire, and the beds could always be detected by their attendant growth of gorse bushes. The Stonehouse, Robinswood Hill, Pifford, and Aston Magna pits were all in this deposit. The Greet Potteries obtained their raw material from the same beds. Views of the extensive Cattybrook Works were shown on the screen. Here bricks are made of coal-measure shales, as is also the case at Shortwood, near Mangotsfield. At Stoke Gifford the red (Keuper) marls are ground up for brick-making purposes, and it was pointed out that this rock was largely used in the Midlands for this purpose. The lecturer emphasised the necessity of exercising great care in opening a brickyard. Suitable "earth," a site near a railway or proximity to a likely market were essential desiderata. Brick-making seemed quiet in some parts of the county. The brick earth was there, but the want of a reliable market was the defect.

A discussion followed, in which a number of members and visitors took part, and the meeting closed with a hearty vote of thanks to the lecturer.

ENGINEERING PLANT IN INSTITUTIONS.

(Concluded from page 132.)

The Laundry.

The essential equipment of an institution power laundry consists of washing machines for washing, boiling and rinsing clothes, hydro-extractors for wringing or, more properly speaking, extracting the water; drying horses, or closets for drying the clothes; mangling machines, or ironing machines for pressing. Added to these are auxiliary apparatus, either for increasing the capacity of the plant, or for adapting it to the needs of any particular institution.

Tanks are also fixed in the laundry, variously for the purpose of soaking or rinsing. Boiling tanks are also occasionally added, but more frequently boiling is now carried out in the washing machines. Insane asylums have additional washing machines for fouled linen, which is cleansed, washed and dealt with without requiring to be touched by hand.

In workhouses and infirmaries, and infectious hospitals, disinfecting machines are added, and in the first-mentioned institutions a hand-power plant is sometimes installed as a source of employment for the inmates.

Hospital and school laundries are also further equipped with certain refinements in the way of special apparatus for dealing with body linen and starched apparel.

Washing machines may be described, briefly, as a stouter case provided with a brass inner cage, which turns on a shaft. This inner cage is provided with perforations to allow the water which is turned into the outer cage to enter upon the linen. Various makers have specialities in the design of these cases, all with the intention of introducing the water into the cage with greater force, since the washing depends upon what may be described as a thorough splashing of the linen into the water. Washing machines are provided with an automatic reversing gear, by which the machines are made to run a certain number of revolutions, alternately, in either direction to avoid "roping" the clothes. The outer case of the machine is fitted with a cold-water and a hot-water inlet valve, and a perforated steam-spray pipe, which is fixed along the bottom. Many machines are (and should be) fitted with an appliance making it impossible to start the machine while the outer case is open. Many of the fingers and hands which have been sacrificed on account of the absence of this arrangement.

When washing of the clothes is complete they are transferred to the hydro-extractor. This machine had its genesis in the sugar refinery, and was first—and still is—used for extracting the syrup from the sugar. It consists of an outer cage of cast iron or steel, and an inner basket which revolves on a central spindle at a speed of about 1,500 revolutions per minute, and the water is forced out of the clothes through the perforations of the cage by centrifugal force into the outer case, and from thence to a drain. This is, beyond question, the most thorough method of extracting the water, and in many cases it is only necessary to pass the clothes through the ironing machine to finally dry and finish them. It is said that the hydro-extractor will extract 85 per cent. of the moisture from linen, against 30 per cent. with the best wringing machine.

If the clothes are not to be ironed they are taken from the hydro-extractor to the drying chamber. This chamber is sometimes fitted with a series of "horses," or rails, upon which the clothes are hung, the continuous line of the frames of the horses forming one side of the chamber, or, as is now more general, the closet is entered by a door and hung with lines of galvanised steel wire. It was formerly the practice to construct a furnace under the floor of the chamber, or to fix in the same position a quantity of steam-heated pipes, to dry the clothes suspended in the chamber, but it is now becoming more generally recognised that heat is of little use without air, and that a large quantity of air at a comparatively low temperature is of far more service in drying than a scorching heat with little air.

Very few drying plants are now installed without a fan for forcing in fresh air over heated surfaces, and it has also become more generally recognised that the heating surface is necessary for heating the air, when a fan is employed, is much less than under the old system of letting the air supply take care of itself. Although the temperatures of these chambers frequently do not exceed 140° to 150° with a plentiful air supply, they are far more efficient than the old chambers were at 180° with a restricted air supply. While it is quite true that the capacity of the air for taking up moisture increases with its temperature there is a point reached at all temperatures, known as the "dew point," at which air can take up no more moisture, and before this point is reached in a drying-room the air should be cleared out of the room.

It has often been debated whether it is best for the air to enter at the upper or lower part of the drying chamber, and both positions have their adherents.

On the one hand it is said that the natural tendency of heated air is to rise, and should, therefore, be extracted from the top of the chamber, and on the other hand it is asserted that if the air is driven upward, as it picks up moisture on its way the moisture may condense on the roof of the chamber and fall back on the clothes. The writer personally has an open mind on the subject.

It was mentioned a little way back that where the clothes were finished in an ironing machine the drying closet was often unnecessary. Time does not permit us to discuss the matter in detail, but mention may be made of the best known machine, viz., the Decoudun. This machine is of French origin, and is also sometimes known as a calender. It consists of a fixed hollow concave polished cast-iron bed, in which steam is admitted at a pressure of 40 lbs. per square

MODERN EUROPEAN ARCHITECTURE.
FRANCE.

PREMIATED FACADE, PARIS, 1909.—No. 42 COURS-LA-REINE AND PLACE DE L'ALMA.—MM. NAVILLE & CHANQUET, Architects.

ch, and a temperature of about 235° . In the hollow of is bed revolves a cast-iron cylinder of large diameter, which also heated with steam at a lower pressure. This latter is encased in felt, and its function is to engage the article to be ironed, and pass it, with a slow rubbing motion, over the concave heated bed, which not only imparts a finish to the article, but also dries it. These machines are also fitted with levers for raising the rollers off the bed, and they should also always be fitted with finger guards, as accidents are, unfortunately, not at all uncommon with these machines.

Having described some of the principal machines to be found in the institution laundry, we can only regret that

time does not permit of the description of others, as we must pass on to the method of driving.

The machines are, of course, driven from a line of shafting, which is driven by either an electric motor or a steam engine. The latter is, of course, the more economical arrangement, as it will usually be found that the heat contained in the exhaust steam from the engine will generate all the hot water required for the laundry purposes, and also heat the air-heating coils for the drying-room.

The writer's invariable speed for the shafting of a laundry is 200 revolutions per minute, which makes not too small a pulley for a washing machine, and not too large an one for the hydro-extractor. A slower speed is usually

adopted for the ironing-room, however, as almost all mangling and ironing machinery is of a slow-running nature.

Before turning the exhaust steam from the laundry engine into the hot-water heater and the air-heating coils, it is necessary to free the exhaust steam from its suspended grease particles as much as possible. In a previous passage it has been pointed out that grease is a very poor heat conductor, and it is fatal to heat efficiency to permit the inner surfaces of such heaters to become coated with it. Before using the steam it should be passed through a good type of grease separator, which is in construction very similar to the steam dryer, which has been already described.

The greasy deposit should be removed as soon as deposited in the separator, and discharged to the drain, together with the condense water from the heater and air-heating coils, and the interior frequently cleansed.

The separator should be fixed on a by-pass connection from the exhaust pipe of the engine, and the exhaust pipe continued to atmosphere as usual. In order, however, to induce the steam to pass to the heaters the exhaust pipe should be fitted with a weighted valve loaded to not more than 8 ozs. per square inch. It is not a good practice to increase this back pressure, since it should be remembered that such back pressure is not a reduction of the initial pressure but of the mean effective pressure, and the power of the engine suffers, as a glance at any indicator diagram will show.

The last appliance which shall be mentioned in this review of the engineering appliances is the disinfecter, and its principle is as interesting as most of them. This machine is usually built into the partition wall, dividing the disinfecting building into two divisions. The disinfecting machine has an oval section about 7 or 8 feet long and about 4 feet high, fitted with an outer steam jacket and a door at each end of the machine, one door being on the "infected" side of the partition referred to, and the other door being situated in the "disinfected" chamber. A travelling cradle is made to run in and out of the machine, and is sufficiently large to contain a bed. A vacuum apparatus, consisting of a steam air ejector, completes the equipment of the disinfecter. It has been found by experiment that nothing but a moist temperature, exceeding boiling point, is successful in destroying germ life and the eggs of vermin, and that a dry temperature, high even to the point of damage to the articles under treatment, is practically useless for the purpose. The operation of the disinfecting machine is, therefore, as follows:—

After the articles are placed in the machine, and the covers made perfectly air-tight, steam is turned on to the air ejector and all the air is removed from the inner chamber, and from all the minute air-containing cells of the articles under treatment. Steam is then admitted to the outer jacket, and secondly to the inner chamber, the steam in the outer jacket, being at the same temperature, preventing condensation of the inner steam. The steam in the inner chamber condenses on the colder clothing, and wets it through with the hot water and destroys all life. When the operation is complete the inner steam is shut off, and the resulting vacuum vaporises the remaining moisture out of the clothes; warmed air is then admitted to complete the drying process.

Since it is far easier to exhaust our time than the material at our disposal, we must take leave of a very interesting subject, and the writer's regret is that it has been impossible to give it more than general treatment, and in consequence feels that the whole paper is very cursory; but although you, perhaps, have heard nothing which you do not already know, it may make material for profitable debate.

OUR CONTEMPORARIES FROM OVERSEAS.

THE *American Architect* (New York) has gathered a series of illustrations from the twenty-sixth Annual Exhibition of the Architectural League of New York, which includes examples not only of the latest buildings designed by American architects, but also of garden architecture and of painting and sculpture in connection with architecture.

Der Architekt (Vienna) gives several illustrations of the work of Professor Josef Hoffmann in modern domestic architecture, a toy shop at Buda-Pest by Laszlo and Josef Vago and a design for a bathing establishment by Rudolf Perco, a student of the Wagner School.

Arkitektur og Dekorativ Kunst (Christiania) illustrates some of the plans, including those premiated in the competition for the revision and addition of the town plan of Trondhjem. The first premiated design is by Albert Lillienberg and Sigfrid Ericsson, of Göteborg.

La Construction Moderne (Paris) illustrates the Oceanographic Institute recently erected in the Rue Saint Jacques at Paris, at the expense of Prince Albert of Monaco, from the designs of Mons. Nénot.

Stone (New York) has an interesting account of a new departure in the use of slate for roofing on flat surface which is worthy of attention, though no comparison is made of the cost of the new method with older ones.

Construction (Toronto) devotes the greater part of its space to the description and illustration of competitive designs for the proposed new Knox College, Toronto, for which Messrs. Chapman and McGiffin have obtained the first place. The designs are in various phases of Gothic, mostly Norman, though the winning design is based more or less on Tudor work.

Engineering Record (New York) contains an account of the testing of the foundations of the new 40-storey municipal building at New York.

COMPETITION NEWS.

HENLEY.—About fifteen architects have signified their intention of submitting plans for the proposed Grammar school at Henley.

PENRITH.—The Governors of Queen Elizabeth's Grammar School, Penrith, recently invited competitive designs for the erection of a secondary school, accommodating 200 students with provision for the conduct of technical and evening classes. The premiums offered to competing architects were first 50*l.*; second, 25*l.*; third, 10*l.*, and have been awarded as follows: 1, Messrs. Harrison & Ash, Pilgrim Street, Newcastle-on-Tyne; 2, Mr. W. P. Schofield, Leeds; 3, Mr. Theodore Halliday, Manchester. About 200 architects applied for particulars. The school will cost probably from 10,000*l.* to 12,000*l.*

WALLSEND.—The conditions of the competition for the proposed new school buildings, Wallsend, have been considered by the Council of the Northern Architectural Association, and they point out that the promoters do not state that an architectural assessor will be appointed to make the award, nor is any pledge given that the author of the design placed first will be employed to carry out the work (unless there is some valid objection to his employment). In these respects the conditions are a distinct violation of the regulations issued by the R.I.B.A., and members of the Association have been asked not to compete unless the conditions are modified.

[The Editor will not be responsible for the opinions expressed by Correspondents.]

Statues and Sanitary Conveniences.

SIR,—To what are we drifting, we English nation of shopkeepers? Our notions of fitness are so pitifully severed from an intellectual appreciation of art.

It is now some years since my attention was first attracted to a statue of George III. set up in the quadrangle of Somerset House. I will say nothing as to the merits of the group, my sole desire here being to deprecate the conjunction of statuary and a sanitary convenience.

But now—now, Sir, this degrading treatment of art has been repeated, and with exaggerated emphasis, at the Royal Exchange. The pleasing equestrian Wellington group, which has hitherto stood solidly on the footway, entirely dissociated from any practical or social convenience, now rises to all appearance from an unsubstantial glazed ventilator—and, ye gods! a ventilator to a sanitary convenience.

Cannot the City Fathers make further use of the Iron Duke by rigging up a weather-vane at the summit of the group? The inappropriateness as a simile need not prove deterrent, when the desire for knowing which way the wind stirs our pulses,—Faithfully yours,

prove exceedingly useful to other authorities. Ruislip-Northwood may, indeed, be taken for the present as the leading case on town planning in practice.

THE USE OF GLASS IN BUILDING.*

By MR. NOEL HEATON, B.Sc., F.C.S.

(Official Report.)

AT Carpenters' Hall, on Wednesday, March 9, Mr. N. Heaton gave a lecture on "The Use of Glass in Building," illustrating his remarks with a series of lantern slides.

Mr. Heaton said he understood the object of the series of technical lectures which were being given at Carpenters' Hall was to emphasise the treatment of design rather than to discuss actual building materials as such. The trouble with

this for him was that he was quite incompetent to speak on any question of design. In fact, he was a hopeless materialist, and his study was the technology of materials, and all he could do that night therefore was to discuss with them the subject of the use of glass in building as a material. When they came to think of it, the use of glass in building was primarily determined by practical rather than æsthetic considerations, and with it perhaps more than with any other material design was dominated by the limitations of glass as a material. They would probably all agree that the design of the windows of a house was a most important feature of its architecture, for in this country at any rate glass windows were as necessary to the house as was the roof. The success of the house from the point of view of the dweller in it depended on their planning, as did to a large extent also the beauty of the elevation, and consequently its success from the point of view of the man in the street. He proposed that night, therefore, to try and point out the possibilities and limitations of glass as a material for building and to indicate a few of the troubles as regarded its use.

The most interesting way in which he could bring the matter before them was to review the history of the use of this material as applied to houses. Of course they all knew that glass as a material dated back for many centuries. At least they knew all about how it was used as far back as 1600 B.C., but at that time its use was confined to the manufacture of vases and objects of art and so forth, and it was not till considerably later, almost at the dawn of the Christian era, that they found it applied in any shape or form to buildings. When the Roman Empire developed northwards, and particularly when it extended to such countries as Britain, the Romans were forcibly reminded of the fact that it was necessary to find some material to put into their windows, which would admit light, but exclude air and cold. So long as civilisation was confined

to such places as Egypt and the neighbourhood of the Mediterranean, there was no crying necessity for such a thing, but when the Romans came to this country it became a very serious problem. The Romans were skilled glass-makers, and they were not long in realising that glass was a material eminently adapted for this purpose, and so we find that glass was first used for windows by the Romans.

He would put on the screen illustrations of three fragments of typical window glass used by the Romans. The first piece came from Switzerland, the second was a piece he picked up himself at Pompeii last summer, and the third was a piece found at Silchester. It was made by just pouring the molten glass on to a slab of stone. They could tell this by the nature of the surface. The Romans made it in sheets about 12 inches by 18. It did not answer to their ideas of window glass, for it was not perfectly transparent; it was merely intended to exclude air and admit light, and they did not hope to see through it. As regarded the material, however, it was very good indeed, and was very durable. Essentially glass consisted of sand, which was fused with soda or potash and also some such material as lime or magnesia. Roman glass would contain about 70 per cent. of silica or sand, 15 per cent. of soda, and 15 per cent. of lime. These materials were fused together in a furnace, and the resultant glass was poured out on to a slab as he had described. Until recently it was supposed that this was the highest height reached by the Romans in making glass for the purpose of windows, but now they had discovered the Romans knew all about the use of the blow-pipe, and by means of the blow-pipe they could make glass of much superior character to that just described. As a matter of fact it was only within the last few years that it had been shown that the Romans were the first discoverers of the several processes of making window-glass by the aid of the blow-pipe which were in use at the present day.

He would try and describe briefly the various processes in vogue of making glass by the aid of the blow-pipe. In the first illustration they saw a man taking the glass from the crucible of molten glass. He took a mass of viscid glass on the end of his blow-pipe and rolled it on the surface of a slab, the object being to round the glass so that he could blow it in an even and regular manner. He then took the lump of glass which he had rolled out on the marver and blew air into the centre and then by successive stages he blew the glass out until it took the shape of a long cylindrical flask. By further manipulation the ends of this flask were opened out, resulting in the production of an open cylinder—similar to a lady's muff, hence the name "muff glass" commonly applied to this process.

The cylinders thus formed were converted into flat sheets by slitting them along their length with a diamond and then unrolling them, so to speak, this operation being conducted in a special furnace.

There was another process of getting glass into sheets, and that was by means of spinning. The started in exactly the same way by blowing a small flask but subsequently the glass was rapidly revolved in front of the opening to the furnace, when by the influence of centrifugal force it opened out until finally they got a flat disc

* An illustrated lecture delivered at Carpenters' Hall on March 8. Seventh of the Series on "The Arts Connected with Building."

with a lump in the centre. The Romans knew all about how to make glass in this way, and were by no means confined to the crude method of rolling it on a slab. He would show a photograph of a specimen of glass found at Silchester, and which was now in the Reading Museum. It must have been made towards the end of the Roman occupation, for similar glass had been found nowhere else except in England. It was a much more perfect glass than the earlier specimens he had shown of cast glass, and much more transparent.

Window glass was fairly well developed by the Romans, but with the fall of that Empire it suffered a period of decline. Window glass was quite common in Roman times, but after that it became almost extinct until getting on towards the eleventh century, when it was revived again in connection with the art of stained glass. At this time they found both the methods which he had described of making glass by means of a blow-pipe in use—e., the muff glass and the spun glass, although the muff

a great display of stained glass, and all throughout the mediæval period the use of glass as a building material was practically confined to this craft.

Much as there was to say on this important branch of the subject, he would leave it with this cursory reference, because his purpose that night was to deal with the more prosaic use of glass as a building material, and they did not find it used to any very great extent in that connection until getting on towards the end of the sixteenth century. They got a connecting link between stained glass used in church building and its more common use as a building material in the fine domestic stained glass, as it was called, which was particularly characteristic of Swiss work. They put little panels of painted glass in their doors, which was very fine work of its kind. It was not exactly stained glass, but they must give it a tribute of admiration. Mr. Heaton exhibited a photograph of the building which is now the Training College on the west side of the Cathedral Close at Salisbury, and pointed out how, owing to the fact that glass could only be obtained in small pieces at the time the house was built, the windows were divided up by stone mullions. The lecturer proceeded to show other views, including one of a window in the Jerusalem Chamber of Westminster Abbey, to illustrate the use of glass at the period. A very interesting example was the window recently discovered at the Guildhall, a photograph of which he was able to exhibit by the courtesy of the City Surveyor. The Guildhall was built in 1411, but they knew that in 1643 the stained glass was turned out as being idolatrous.

There was a considerable suppression of stained glass at the time of the Reformation, and where discovered it was turned out; and they knew that in 1643 the window at the Guildhall was reglazed with plain glass. At some time or other that window was filled in with lath and plaster, and there it remained hidden away until last year, when Mr. Perks discovered it and revealed it, and it was quite certain that a great deal of the existing glass was that which was originally put in in 1643. They knew that the window could not have been wholly blocked up at the beginning of last century, because there were one or two panes of glass of a type not introduced until then, but all the rest was what was known as broad glass made by the muff process and characteristic of the seventeenth century. Mr. Heaton next showed two windows of a charming old house at Ipswich, the glass of which was of about the same period as that in the Guildhall window. He was at Ipswich last week, and observed that the majority of the glass in the house was put in during the reign of James I. or Charles I. The window was surmounted with the arms of Charles II., but that he thought was added

ROMAN GLASS.

glass was then called broad glass. The old cast glass of the Romans had entirely disappeared, and they did not see anything of it again till quite modern times. The mediæval window glass was not what the builder of the present day would call good glass; it was very imperfect from the practical point of view, but very beautiful to look at. Owing to the very crude method in which it was made, it had a lot of peculiar markings, due particularly to the process of flattening and the rubbing of the hot iron along the surface. It would certainly not have done for making lantern slides, but it gave a beautiful effect to anything seen through it. It was this peculiar quality which gave the beauty to the mediæval stained glass so much used in the Gothic period. Spun glass was also used at that time, and this they could tell by the "reaminess" of the glass and the circular line formed during the process of spinning. Glass in those days could only be made in very small pieces, and as a consequence they got the idea introduced of joining the pieces of glass by means of strips of lead, so characteristic of stained glass. It was only by means of this lead-work that they could fill the large spaces of church windows.

He had told them that the Roman window glass was very perfect in composition, but as they went on through the mediæval period it steadily deteriorated. They could dig up Roman glass 1500 years old practically untouched, when mediæval glass under the same conditions would be destroyed. Up to a certain point that was an advantage, because the decomposition of the surface of the glass added very considerably to its beauty; but that of course was only within limits, and when they got to the point that the glass almost disappeared it was going too far. As time went on they got worse and worse in this respect. At this period window glass was not used very much for domestic purposes, but was almost entirely confined to use in connection with the art of stained glass for church windows. Stained glass was of course an extremely important feature of mediæval work, and had a great influence on the development of Gothic architecture. He showed an autochrome slide representing the celebrated "Five Sisters" window at York Minster. York, amongst other churches, was distinctly built in order to gain

later. All the windows he had shown were simple diamond panes, but sometimes more elaborate windows were employed, and as early as 1615 a man wrote a book giving various designs for the use of glaziers. Besides broad glass, sometimes spun glass was used for domestic windows, and this style of glazing was often known as German round glass. The effect was very delightful altogether.

Mr. Heaton exhibited a view of the Stonegate in York to give an idea of the way the windows fitted in with the

general architecture of the period; and also a view of what used to be Nols Coffeehouse in the Cathedral Yard of Exeter with seventeenth century windows. He thought they would all agree that the charm these quarry windows had was the way they broke up the surfaces. But, as he had pointed out, this method of glazing came about by the limitations of the material, and they could not give the builders the credit of having done it for effect. If they could have got large sheets, no doubt they would have used them; but that was difficult, and so they got the delightful method of glazing they had seen. But as civilisation, so to speak, progressed, there arose a great demand for larger sheets of glass. They were not satisfied with these quarries, and wanted larger sheets with less colour and "imperfections." People set to work, and towards the end of the seventeenth century chemistry and science began to be organised, and especially they got to discover how to make soda direct from salt, which gave an immense impetus to the manufacture of

glass. They also began to get organised effort in the development of mechanical skill, and, putting everything together, they gradually got away from those limitations of the material which resulted in the invariable use of small quarries in glazing.

About the end of the seventeenth century a new method of making spun glass was introduced on the Continent and brought over here, the first factory being set up at Newcastle, which turned out what was known as Crown glass. They were able to get larger panes by this process and make them more cheaply, and in consequence broad glass was very soon entirely superseded by Crown. Many of the old houses turned out their diamond panes and put in sashes filled with Crown glass. They went on developing and constantly increasing the size of the discs or "tables" until they got to the limit of practicability by the process. The largest Crown table he had ever seen was 52 inches in diameter. Theoretically the largest sheet they could get from that was 31 inches by 18 inches, but in practice they did not get anything like it, and the largest square of Crown glass he had ever seen measured 19½ inches by 17. Although the Crown glass was far superior to broad glass, yet it was still expensive, because there was so much waste. They had to cut away the centre unless they were content to have the bull's-eye in the sheet. In the old days they objected to these bull's-eyes and threw them away, but now there was rather a craze for them. The most economical pane of glass they could get by the Crown process was about 16 inches by 12, and they found that from the end of the 17th to the beginning of the 19th centuries the characteristic window pane was about that size. Generally they were arranged with the longest side upwards, but not always. A good idea of the effect of Crown glass was seen in the High Street, Exeter, and here some of the panes were put the other way about.

People, however, were still not satisfied, and wanted more light and larger panes, and attempts were constantly being made to get rid of the limitations imposed by Crown glass. The first quarter of the nineteenth century saw a reintroduction of the muffle process in an improved form. It was made on the Continent, and introduced into this country about 1826 by Mr. Hetley, of Soho Square, whose firm still existed as glass

merchants. Shortly afterwards its manufacture was taken up by Messrs. Chance, of Birmingham, who became the principal manufacturers of Crown glass. This improved method gave enormous advantages as regarded the size of the sheet obtainable, and also as regarded the price, and it rapidly superseded Crown glass until at the present day Crown glass was almost obsolete. Crown glass was not quite obsolete, however, and was still made to-day: he particularly mentioned this, because he was being constantly told that Crown glass was not being manufactured to-day, but that was a mistake. For all practical purposes, however, this muffle glass, made with various mechanical appliances and improved out of all recognition from the earliest made as regards details, but still in its main outlines the same process, was the glazing material of to-day. Somewhat earlier in date to the improved muffle glass there was introduced another method of getting rid of the limitation of Crown glass, which was the method used by the very earliest of window makers, the Romans, viz., the pouring of the glass out on to a slab and rolling it and casting it.

The Roman cast glass had been forgotten, but in its essential particulars the process of making plate glass was the same. The resulting product was, however, quite a different thing owing to the enormously improved method of manufacture. The funny thing was that not only was it the same process in the rough, but at the time glass-makers reverted to practically the same composition for their glass as was used by the Romans. They found that the Romans, by their empirical methods, arrived at a composition for their glass which was identical with that arrived at by the researches of modern chemists. If they merely took their glass and rolled it on a slab they had a material which was not perfectly transparent, as was necessary for their windows, but it was more or less translucent. It was no good for ordinary windows, but was used nowadays for such purposes as roofing and skylights. It was made very cheaply, and used, of course, to an enormous extent, and various kinds were made. He need not go into the different qualities, but there was one detail he would like to mention.

Nowadays the glass was cast on a huge iron table and rolled into shape by means of a ponderous roller: if the roller and the rolling-bed were plain, a sheet of glass smooth on both sides would be obtained. But by engraving either the roller or the table with a design (and in practice, for motives of economy, the former course was generally adopted) what was known as figured-rolled plate was produced. This glass was a wonderful production considered from the

mechanical standpoint, and was largely used for so-called decorative purposes, although in the lecturer's opinion its merits from this point of view were absolutely non-existent. One of the most wonderful achievements in modern window-glass making was wire-wove or armoured glass. A great disadvantage to the use of glass for roofing purposes was the consequences if it was fractured, and in case of fire especially, it might lead to considerable damage. Consequently, modern skill had tried to invent a sheet of

glass which would not collapse, and as a result they had this wonderful wire-wove glass. Iron netting was stretched across the table, and the molten glass was poured over the table so as to enclose the netting within its surface. He would not go into all the technical difficulties which cropped up in connection with the process, but at first sight it seemed impossible owing to the great difference in expansion between metal and glass; but these difficulties had been got over, and now this was a very important fire-resisting material. There were some splendid examples of wire-woven glass in the lights of the Hall in which they were assembled. By the plate-glass process which he had described it was impossible to make the glass quite transparent, owing to the glass which came in contact with the rollers getting chilled, and also it got an irregularity of surface from contact with the rollers and the table. It was possible, however, to convert it into a perfectly transparent sheet by grinding away the rough surface, and by doing this they got that wonderful material which they knew as polished plate. The sheet was first ground by means of machinery with sand, which removed all the real irregularities and reduced it to a plain surface, but dull and rough. Then in another machine it was subjected to further grinding with very fine emery-powder, which took away the rough surface and planed it to a true surface; and then, finally, it was taken to another machine, where, under the action of felt rubbers, it attained its final brilliant polish.

They would see, therefore, that there were two types of window glass available at the present time—the plate glass made by casting, and that made by the aid of the blow-pipe. Of the latter they again had two varieties—the muff glass, known in the trade as sheet (although, of course, this term really applied to all varieties), and the Crown. Which of these glasses they used in building was determined by various practical considerations. They had to consider the quality and texture, the sizes available, and what was most important, the cost. They should, or might, also consider the durability of it. The chief quality of plate glass was that it was absolutely featureless—its function was to entirely obliterate itself; it was purely utilitarian; it was a means to an end, and nothing more. But one of its chief points was that it could be obtained in very large sizes: sheets had been produced measuring 25 feet by 15 feet. He had not seen a sheet quite so large as that, but he had seen one very near to it. For the covering of large surfaces in one sheet one was absolutely limited to plate glass. It could be obtained in various thicknesses, from $\frac{1}{4}$ inch up to over 1 inch, although that generally used was about $\frac{1}{2}$ inch. For special purposes, such as ship and port-hole lights, it was made of an inch thickness, but they could not get anything like such huge sheets with that thickness. As to its durability, owing to the fact that the natural surface was removed, the polished surface was not so hard as the natural surface got with the blown glass. If it were only possible to use it as it came from the rollers, without polishing, it would be a wonderful material, because the natural chilled surface was much harder and more resistant to scratching and decay than the interior of the glass, which was exposed by the action of polishing. Therefore, it had always to be remembered that glass which was polished to a true surface was easier damaged and scratched in the operation of cleaning and so on.

As to cost, polished plate glass could be obtained in three qualities. Although constant improvement in mechanical skill and modern devices had pretty well obliterated faults, still, there were always imperfections cropping up which could not be entirely got rid of, and so the plates as they were made were subjected to sorting, and were generally divided into three grades—the ordinary quality, the best quality, and the very best quality, the latter being chiefly used for mirrors. Price varied considerably, according to the quality of the glass and to the size of the sheet, for it was much more difficult to make a large sheet, and also more difficult to get a large sheet absolutely perfect. Very often a large sheet of polished glass when finished would be found to have an imperfection in the centre, and it had then to be cut into small sheets. The ordinary price would run from somewhere about 1s. a foot in the small sizes to getting on to 5s. a foot and often more in the very large sizes. It was a wonderful thing that it could be made for anything like this price, and prices had come down enormously as time had gone on. Up till 100 years ago a sheet containing 100 square feet was looked upon as a masterpiece. If they took a sheet 12 feet by 8, which would contain 96 square feet, it would not have been possible to have made such a

thing until about 100 years ago, and some time after that the cost would be about 200l., whereas to-day such a sheet could be obtained for less than 50l. It was a marvellous tribute to the skill of modern civilisation that such sheets could be produced, and it was hard for anyone not familiar with glass working to realise the enormous difficulties which had to be overcome in the manufacture. The more they knew about glass the more they would marvel that such things as these huge polished sheets of plate glass should be possible.

Although in a rough outline the process of making sheet glass was exactly the same to-day as in mediæval times, yet in the details it was very different. All sorts of elaborate contrivances had been introduced for getting rid of reaminess, removing all traces of colour, and getting the sheets perfectly flat and plain; but the best sheet glass which was ever made never entirely eliminated these defects, and there was always in batches of sheets a number not perfectly even in thickness, or not perfectly flat, or with air bubbles, and so on. So as with plate glass, it had to be sorted into qualities. What were known as "thirds" and "fourths" were used for glazing generally, although sometimes the best builders used "seconds." The "best" quality was almost exclusively used for picture framing, and above that they had the "best polished." They had a still further quality, which was practically a variety of plate glass—it was ground down and polished like plate glass, and was known as "patent plate." It was blown glass, but had all the virtues and defects of plate glass. As to size, they could get sheet glass 90 inches by 30, which was the largest he had ever seen. About 3 feet square represented the average limit. The great point of this sheet glass was its very low price, but, of course, the cost varied greatly according to quality. A good many people did not seem to realise that, and only the other day an architect was telling him that he had great difficulty in getting good sheet glass. What usually happened was that the architect said he wanted the best, and then put in his specification a price which was rather a fine cut for "thirds," and so the builder supplied "fourths." The "patent plate" was about as expensive as ordinary plate glass, and "polished best" was about as expensive as Crown glass.

The "imperfections" of the ordinary sheet glass used in glazing gave it a certain distinctive character which was not, however, altogether pleasing, and whilst it was greatly superior to plate glass from this point of view it was much inferior to Crown.

The charm of Crown glass was its wonderful texture. It was not perfectly flat, and that caused a peculiar distortion when the light was reflected from it which was much more pleasant than that got from sheet glass. He had attempted in the slides shown to illustrate the difference between the various types of window glass as regarded their texture, but had found it difficult to do this satisfactorily; anyone who cared to do so could, however, readily verify his statements by comparing the effect of the windows in old and modern houses. Houses retaining their original Crown glass could be seen in all old towns and in many parts of London.

They also got a brilliancy by the process of spinning glass which could not be approached by the artificial process of polishing, and they obtained a hardness. Whilst he did not suggest it should be used in ordinary houses, yet he did suggest that in the repair of old houses one should think whether it would not be advisable to revert to the use of Crown glass, especially when it was a case of restoring a building where such glass still existed. He was looking at Mr. Perks' wonderful restoration at the Guildhall, and pointed out that the only thing required to make it perfect was the use of Crown glass in the new portion.

It seemed to him that one of the greatest difficulties an architect had to face was how he was to carry off the effect of the huge, gaping voids filled with plate glass, and he must say the success of modern architects in doing this was most wonderful. But they must all feel the need there was as regarded windows for breaking up the surfaces so as not to conflict with the elevation of the remainder of the house, and of late years there had been a tendency amongst architects to revert to the old quarries and to try and induce their clients to have windows with leaded lights; and some exceedingly fine things had been done in that way. But there were a lot of difficulties in this use of leaded lights in modern work. The cement gave way, and the lights buckled and got out of shape, although in recent years that had been largely overcome by the use of lead with a bar of steel in the centre; but this was not entirely satisfactory.

There was also the great tendency for draughts with these leaded lights, and the great difficulty from the housekeeper's point of view of keeping them clean. The fact of the matter was that they had friction between beauty and convenience. It seemed to him these leaded lights were only practical under rather abnormal conditions, although he admitted they were exceedingly beautiful. Personally, he suggested that the divided sash offered a compromise—the sort of window they had in the eighteenth century, with squares about 16 inches by 12. This broke up the surface sufficiently, and at the same time they were practical, and large enough to be easily cleaned and had none of the disadvantages of leaded lights; whilst if their appreciation of beauty ran to paying 10*s*. a foot instead of 2*d*. they could get Crown glass to render the windows perfectly satisfactory and beautiful.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Royal Institute was held on Monday, the 13th inst., at Conduit Street, Mr. Leonard Stokes, President, in the chair. Mr. H. T. Hare, the Honorary Secretary, announced the death of Mr. Arthur Basil Cottam, Associate, elected 1883. Also of Mr. John Merven Carrere, the distinguished American architect, who met his death in a street accident last week. Mr. Carrere was to have read a paper before the Institute this session, but finding that he could not be in England at the date arranged the paper was postponed till next session. Mr. Carrere's nomination as hon. corresponding member of the Institute was on the Council agenda for consideration at that day's meeting, and his untimely death has deprived the Institute of the honour of numbering among their members an architect so gifted and distinguished. A vote of condolence was passed to the relatives of Mr. Carrere.

Mr. J. A. GORCH, F.S.A., then read a paper, of which we give an abstract, on

The Burlington-Devonshire Collection of Drawings.

At a general meeting of the Royal Institute on June 27, 1892, this collection of drawings was first exhibited, and on December 17, 1894, they were by a declaration of trust placed in the custody of the Institute. To Mr. J. D. Crace is owed this valuable addition to the library. His own account of how the permanent loan of them came about is as follows:—

"On the death of the seventh duke (December, 1891) it fell to me to value the works of art in the several mansions; and in February, 1892, I was so engaged at Chiswick House, where was this collection. It was kept in four mahogany boxes; and when I came to examine them I found the drawings all mixed promiscuously in utter disorder.

"Lady Louisa Egerton, the late duke's daughter . . . invited me to say how they could be rendered more really serviceable, and I then told her quite frankly that I thought that such a collection in the keeping of the Royal Institute of British Architects could be made accessible to those to whom they were really of great interest.

"She undertook to talk the matter over with her brother (the new Duke). The result was that his Grace consented to make the architectural drawings a 'gift in trust' to the Institute (without power of disposal), reserving to himself Inigo Jones's drawings for scenery for the 'masques' of Charles I. These last are now at Chatsworth; but I believe that a few remain in the R.I.B.A. collection."

Attached to the declaration of trust is a schedule which enumerates 17 bound volumes of drawings, mostly by Palladio; and two boxes of miscellaneous drawings in number about 295. Mr. Crace concludes his remarks on these loose drawings by saying, "These boxes require careful sorting before any satisfactory list of the contents can be made."

It is these unsorted drawings which are the subject of the present paper. They have now all been sorted and arranged in an intelligible manner.

They are of very great interest, being connected largely with our own Inigo Jones, and his relative and assistant, John Webb. They throw some curious and, perhaps, unexpected light upon the relations of the two men.

The two most important collections associated with the name of Inigo Jones are those at the Royal Institute and those at Worcester College, Oxford. It is a curious fact that a careful investigation of both collections goes to show that they are both more closely connected with John Webb than with Inigo Jones. It is highly probable that they are the two halves of the same original collection.

The original Webb collection, which (if these conjectures are right) was thus divided, consisted mainly of Webb's own drawings, but among them were a certain number made by his venerated master.

The Institute's own collection illustrates in a most interesting manner the changes which had come over the methods of house-design as compared with what is to be found in the Thorpe and Smithson collections. But more important still is the light thrown upon three other highly interesting points:—

1. The draughtsmanship of Inigo Jones.
2. His relations with John Webb.
3. The authorship of the design of the second portion of Greenwich Palace, known as King Charles's block.

There are not many drawings left which are actually signed by Inigo Jones. In the Burlington-Devonshire collection there are five, all architectural subjects. But there are others bearing his handwriting, and these may safely be attributed to him. A study of these goes to show that neat architectural draughtsmanship was not his strong point. There are three, indeed (a porch signed "Inigo Jones fecit 1616," a certain house signed "Inigo Jones," and the west front of St. Paul's Cathedral, unsigned), which are surprisingly poor stuff for so great a man to have produced.

It is curious that of the five signed drawings two should give so inadequate an idea of the master's power. Two of the other signed drawings give the details of a gateway for Lord Lincoln at Weybridge. There is a certain amount of freehand drawing in one of these; and in those which follow it is still more in evidence, and the conclusion to which all these drawings point is that Jones was much more at home with his pencil and pen than he was with his tee-square and compasses. He was at his best in his sketches for carving, and particularly in those of the human figure.

We now come to the relations of Inigo Jones and John Webb. Jones was the uncle of Webb, and took the lad into his office in 1628, when he was seventeen years old. It is probable that Webb remained working with his uncle until the latter's death in 1652. Webb became a very excellent architectural draughtsman: and if the estimate of Jones's powers in this direction suggested by these drawings be correct, Webb must have been his right hand. Webb has always been regarded as a pale shadow of Jones. He himself had an unbounded admiration for his master. Evelyn speaks of him as "Mr. Webb (Inigo Jones's man)." But an unprejudiced examination of the Institute drawings and those at Worcester College leads to the conclusion that a little reputation ought to be added to Webb's stock, and, perhaps, a corresponding little deducted from that of Inigo Jones.

In speaking of the architects in the reign of George II., Horace Walpole says, "It was in this reign that architecture resumed all her rights. Noble publications of Palladio, Jones, and the antique, recalled her to true principles and correct taste."

The works of Jones to which Walpole refers were, no doubt, those comprised in the two volumes of Kent, entitled "The designs of Inigo Jones, consisting of Plans and Elevations for Publick and Private Buildings. Published by William Kent, with some additional designs, 1727." The first volume contains seventy-three plates, of which the first fifty-two are devoted to the great palace at Whitehall.

The second volume consists of sixty-three plates, of which the first fifty are of houses and palaces attributed to Jones. Then follow three of Lord Burlington's work. Then three of the west front of St. Paul's. The last seven are of a church attributed to Palladio.

The plates representing Jones's work are inscribed at the foot, in the left-hand corner, "I. Jones, architectus"; in the middle, "H. Flitcroft, delin."; and in the right-hand corner "H. Hulsbergh, sculp." Hulsbergh, therefore, engraved them about the year 1727 from drawings made by Flitcroft. But where did Flitcroft get his particulars from? Jones had been dead seventy-five years. Fortunately, we are able to answer this question, for we have not only Flitcroft's carefully-finished drawings, but also, in nearly every case, the original drawings which he transcribed.

Here comes the interesting point. None of the latter drawings are signed; many have no writing upon them. A few, however, have notes—dimensions, calculations, notes as to the proportions of the rooms and of the columns. The general impression conveyed by the drawings is that they were being designed by the draughtsman as he worked. Who, then, was the draughtsman? So far as the evidence of the writing and drawing goes it was not Inigo Jones but John Webb. Except one drawing of a house there is nothing among these drawings to suggest that Jones inspired Webb in any

GENERAL POST OFFICE, LONDON.—DETAIL OF ENTRANCE.

sort of way. A much more obvious source of inspiration is Palladio's "Architecture," wherein are many plans and elevations.

We now come to the question of King Charles's block at Greenwich, upon which the Burlington-Devonshire drawings throw much interesting light.

Those who are acquainted with the great hospital at Greenwich will remember that the main buildings comprise five principal blocks. Starting from the river, there are, first, two blocks (called after King Charles and Queen Anne), end-on to the river front, with a vast court between them. Beyond these are two other blocks with colonnades, each having a dome at one angle. Beyond these, again, on the main axial line, but at some distance, is the fifth block, called the Queen's House. This house was the first part to be built, and it has always been attributed, no doubt correctly, to Inigo Jones. It was finished in 1635 for Queen Henrietta Maria, wife of Charles I.

There is no evidence that any complete scheme for a large new palace was prepared by Jones or anyone else during his life-time, although some writers have assumed that there was such a scheme.

At the time of the outbreak of the Civil War, therefore, the palace of Greenwich consisted of the old building near

the river, and the new Queen's House at some distance from it. Ten years after Inigo Jones's death, Charles II. built the first half of the present block called by his name. The plans and elevations of the building itself and drawings of chimney-pieces, doorways, and ceilings are in the Institute collection, and they are all drawn by Webb. There is nothing connected with this block that can be assigned to Jones.

It is, however, a curious fact that the design of this building has always been attributed to Jones, although it was said that Webb carried it out from his master's designs. But in view of the evidence furnished by these drawings it is an idea extremely difficult to entertain.

In the first place there is no evidence that Jones had prepared a large scheme, reaching from the Queen's House to the river, for Charles I. There is a plan entitled "Mr. Webb's design for the Palace at Greenwich," which shows a building which was to consist of King Charles II.'s block, balanced by a similar block at some distance, and connected by a third of even greater extent, thus forming three sides of a vast court, of which the fourth was the river. This arrangement would have cut off the Queen's House from the direct sight of the Thames, but would have left it as a conspicuous object on the axial line of the new Palace.

As a matter of fact, the only portion of this design which was actually carried out was the one wing afterwards known as King Charles's block.

If we judge by what we see, and exclude hearsay, the credit for the design of King Charles's block at Greenwich must be transferred from Jones to Webb; unless, indeed, we feel ultimately compelled to re-transfer it to Palladio.

When an examination of these drawings and those of the sister collection at Worcester College has rendered one familiar with them it is not difficult to distinguish between the draughtsmanship and writing of Jones and those of Webb, and the conclusion forced upon the mind is that even in the present day much that is really Webb's has been attributed to Jones.

It is only right that the evidence of these drawings should be carefully weighed, and one result must be the conclusion that John Webb was not merely a pale shadow of Jones, but that he was a man of remarkable independent ability. King Charles's block has been highly extolled. "There is no doubt," one critic says of it, "that this was one of Jones's most successful and beautiful designs." We may still agree with the sentiment, but we must give the credit to Webb. And not only so, but Wren, too, it would seem, must share some of his fame with his less celebrated predecessor. Other authorities have agreed in bestowing the highest praise upon Wren for the magnificent disposition of the Greenwich buildings, some for the vast forecourt, still more for the masterly way in which the space between the next two blocks is contracted, thus enhancing the value of the vista leading up to the Queen's House. According to Webb's general plan, King Charles's block was to be balanced by a similar one across a vast courtyard. Curiously enough, there is also a rough block plan, showing King Charles's block (in ink) already built, another block to correspond on the opposite side of the forecourt (in red pencil), and then beyond them are indications of further blocks drawn nearer together, much in the way which Wren finally adopted. If this plan is Webb's then he adumbrated the very idea for which Wren is justly extolled.

(To be concluded.)

LIVING ARCHITECTS: NO. 40.—SIR HENRY TANNER, I.S.O.
NO. 41.—MR. HENRY TANNER, F.R.I.B.A.

SIR HENRY TANNER, as all the world knows, is the principal architect to H.M. Office of Works, but it is not yet forgotten that he made his mark as winner of the Tite prize in the year 1878, and that he was a prominent member of the Architectural Association in his younger days. His works as a Government architect are many and distributed over the whole country, but his chief achievement is the new General Post Office, known as "King Edward's Building," of which we give several illustrations in this issue. Mr. Henry Tanner, a son of Sir Henry, has used well several opportunities of displaying his skill as an architect, both in London and out of it, Oceanic House, in Pall Mall East, being perhaps his most conspicuous work. He has also quite recently served his term of office as a highly-popular President of the Architectural Association.

THE GENERAL POST OFFICE.

IN the views we present of this great work we have elected rather to illustrate the architectural, we may say artistic aspect, of the building, although it will ever be remembered as the first important application of reinforced concrete construction in this country. Sir Henry Tanner has always had a penchant for the scientific side of architecture, and it is strictly in accordance with his character that he should boldly essay the introduction of reinforced concrete as a method of construction in a public building of the first importance, recognising the advantages that this method offers in such a structure as a General Post Office. The fronts to King Edward Street and Newgate Street are faced with Portland stone and granite. The interior of the public office and the entrance halls have been more lavishly treated than usual, as befits the principal post office of the British Empire. The walls are lined with Arni Alto, a veined Italian marble approaching white, with panels, dado, and door architraves of Irish green, while the caps, bases, and key blocks to the window arches are of kupronised plaster. The counter-front is also of Irish green marble with bronze panel mouldings and kupronised consoles. The telegraph writing-tables are constructed of bronze with plate glass writing-slabs and panels, while the ordinary writing-tables and the

counter have bronze moulded edges. The woodwork generally is of wainscot, oiled and well rubbed. The whole of the sashes to the two lower floors and to the sorting office block, with a few exceptions, are of steel, and those to the Newgate Street windows and to the ground floor of the public office are of gunmetal. Experiments were made with various plastering materials for internal work and as a result a rendering of Portland cement and sand, finished with Keene's, was used. The floors generally are of maple blocks, but those of the lavatories are laid with Ruabon tiles and the public office with white marble mosaic with bands of Irish green. The lifts, fourteen in number, are actuated by electricity, and their equipment was described in *The Architect* of January 6 (Supplement 2, page 17). The heating is effected by means of radiators, through which cold fresh air is carried and warmed as it enters the building. Hot water is conducted to the radiators by means of pipes from six calorifier centres, to which steam is taken from four Lancashire boilers. All the condensed water from the calorifiers is carried back to a large cast-iron receiver, and re-used for feeding the boilers. The hot-water services to the building generally are supplied from one large steam storage calorifier fixed in the basement. Patent automatic control arrangements are fitted to each calorifier, so that only just the actual necessary steam is used to keep the various apparatus working, thus avoiding waste. Kettles worked by means of live steam are fitted in the various dining-rooms on the top floor, giving a constant supply of boiling water. The fire main service consists of a 6 inch ring main fixed completely round the basement, with smaller branch pipes taken from same and carried up through the building, with fire extinguishing appliances attached ready for immediate use at several points on each floor. About 81,000 feet super of mastic asphalt were laid as roofing, skirting, &c., and about 18,000 feet super of compressed asphalt for the carriage ways, using from 600 to 700 tons of material. The interesting process of manufacturing Limmer mastic asphalt is as follows:—The pieces of raw mineral rock, weighing from a quarter to half a cwt. each, are put first into an asphalt crusher, where they are broken to the size of walnuts, and then through the disintegrator. The asphalt, being then ground to a very fine powder, is boiled in special cauldrons, worked by agitators, with a certain proportion of the very best bitumen (as flux), and when heated to about 400° Fahr. a proportion of 10 per cent. to 20 per cent. of fine Bridport grit is added to make gritted mastic. It is next turned out into iron moulds, and made into blocks, weighing half a cwt. each. On arrival at the job these blocks are broken up, put into small cauldrons with just sufficient bitumen (as flux), and when properly heated the mastic asphalt is spread over the concrete surface and rubbed with fine sand by hand floats. The following are the names of the contractors for the various classes of work:—Messrs. Holloway Bros., excavations, ferro-concrete and drains, stonework, plastering, plumbing, joinery, &c.; the Crittall Manufacturing Co., steel sashes, lanterns, &c.; Messrs. Henry Hope & Sons, steel sashes, brass and bronze finger plates; Mr. A. W. Elwood, railings to churchyard; Mr. W. S. Frith, stone carving; Messrs. Cash & Co., heating installation, steam mains, hot-water services and fire mains throughout; Messrs. Geo. Wragge, Ltd., gunmetal sashes, bronze beads for marble, bronze grille, and name plates; Messrs. H. H. Martyn & Co., plaster modelling, gates and railings, King Edward Street, public office counter, wood carving; the Acme Flooring and Paving Co., block flooring; Messrs. Tonks, Ltd., brass divisions to sorting tables, writing shelves in public office, grille in enquiry office, bronze telegram-form boxes, bronze ink stands; Messrs. Lee Bros., marble work; Messrs. R. A. Main & Co., cooking apparatus; Messrs. Diespeker & Co., mosaic and terrazzo paving; the French Asphalt Co., west yard; the Limmer Asphalt Co., roof and east yard; Standard Plating and Kupron Works, kupronised caps and bases, public office, kupronised trusses, &c., to counters, public office, kupronised spring shoes and pencil holders; the Bromsgrove Guild, electric street lamps, bronze electric light fittings, public office, posting boxes; Messrs. Waygood & Co., lifts; Messrs. J. & E. Bates & Sons, bag frames and rack, grip handles and plates, steel channels and spring cutters, steel enclosures; Messrs. Jones & Willis, gates and railings, Giltspur Street; Messrs. Foster & Dicksee, public office fittings; the Educational Supply Association, Messrs. Galbraith Bros., Mr. James Elder, Messrs. W. E. Blake & Co., Messrs. Ripper Bros., Messrs. King & Scarborough, Messrs. Russell & Sons, Messrs. Geo. Hammer & Co., Messrs. Siemens Bros., sorting office fittings.

THE ILLUMINATION OF INTERIORS.
By Professor J. T. MORRIS, M.I.E.E.
(Continued from page 50.)

PART II.
ARTIFICIAL ILLUMINATION.
COAL-GAS AS AN ILLUMINANT.

THERE are at the present time three methods of utilising coal-gas as an illuminant* :—

- (a) Flat flame, batswing, &c.
- (b) Incandescent mantle; low pressure.
- (c) Incandescent mantle; high-pressure systems.

The first of these is recognised to be wasteful, and is in a fair way to become obsolete except in special cases, while the last is undoubtedly a highly efficient means of illumination. A number of experiments on the Keith high-pressure burner were carried out at the East London College. It is not proposed to discuss at any great length in this article the relative efficiency of means of illumination; the reader is referred to the published results of these experiments, which appeared in the *Illuminating Engineer* for September 1908. The author is of opinion that, while improvements have been made in the durability of mantles since that time, the results there given can be taken as standard results obtained under strictly scientific conditions, as far as efficiency is concerned.

There is one point to which the author particularly desires to call attention at this juncture; that is, the relation between the efficiency of gas illumination and the calorific value of the gas employed. If we take an electric incandescent lamp and use it on any electric supply whatever, providing the voltage applied to its terminals is the same in each case, we shall get absolutely identical results both as to light and consumption of power. This is by no means the case with coal-gas. In the tests referred to above, a Keith high-pressure lamp was tested first at the East London College and then in North London. The candle-powers obtained were 425. and 680. respectively. It may be added that in both cases the lamp was adjusted by an expert; most of this difference was therefore due to the difference in quality of the gas supplied. Seeing that practically all coal-gas is now used for its calorific value, whether it be in incandescent burners, gas-stoves, or gas-engines, it seems only right that the consumer should expect uniformity of supply. The now obsolete "illuminating power of the gas" as specified by the Board of Trade should be discarded and a heat basis substituted.

ELECTRIC LAMPS.

Coming to electric lamps, the following table gives the relative consumption of different methods of using electrical energy as an illuminant :—

TABLE VII.

Type of Lamp.	Watts per C.p.	C.p. per Watt.
Carbon	3.5	0.29
Tantalum	1.9	0.53
Tungsten	1.3	0.77
Helion	1.1	0.90
Arc (open)	1.0	1.0
Flame arc (globe on)	0.4	2.5
Flame arc (globe off)	0.26	3.8

The great increase of efficiency obtained by the use of metallic-filament lamps will be observed, and also the very considerable loss of efficiency brought about by the globe which is necessary with such lamps as flame arcs.

A lamp which really conforms to the criterion for proper illumination given previously (*i.e.*, an illumination in which the source is entirely shielded from the eye) is the inverted arc lamp. Where this lamp is used it is particularly necessary that the ceiling above it should be white. When used in workshops it is desirable to place light boarding above the lamp and to see that this reflect-

* The subject of the use of petrol as an illuminant is dealt with by Professor O. A. Smith in this Series.

ing screen is whitewashed fairly often; it pays to keep it perfectly white.
A lamp which calls for particular comment at the

FIG. 7.

present time is the Moore vacuum tube. In this lamp an electric discharge is obtained through a long vacuous tube passing right round the room. The very high voltage

necessary is obtained by means of a small transformer. It is well known that when a vacuum tube has been in use for some time the small quantity of gas contained in it tends to become absorbed. In the Moore vacuum tube an ingenious contrivance automatically supplies small bubbles of carbon dioxide to the tube to make up for the loss caused by this phenomenon.

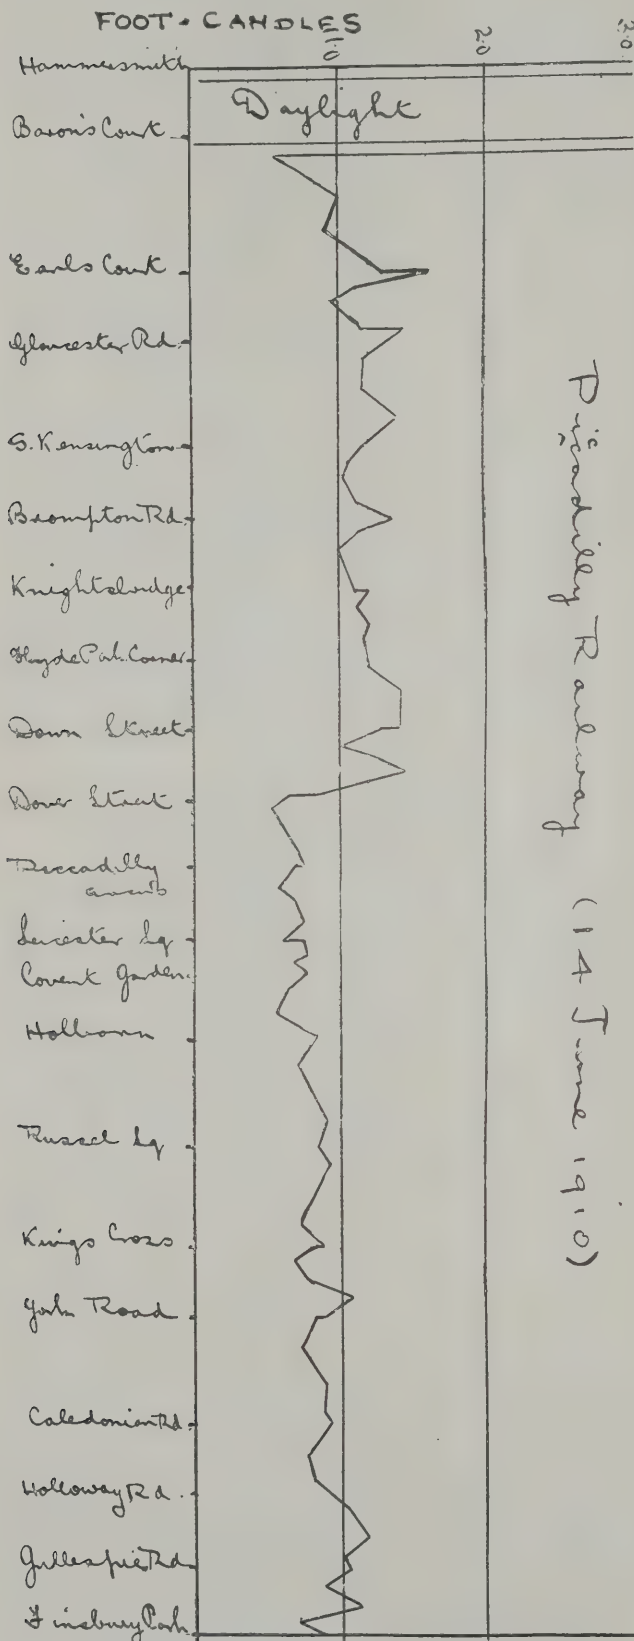

FIG. 8.

The only reason for mentioning this particular lamp is that it has not the dazzling effect met with in other sources of light. There is probably less strain in looking at these tubes when working than in looking out of the window.

We often speak of some lights as "dazzling," and of

others as "soft." The chief determining factor which decides this point is what is known as the "intrinsic

FIG. 9.

brilliance" or the candle-power per unit area of source. The following figures show the comparison between the various sources on this basis:—

TABLE VIII.

Sun	100,000	c.p. per sq. cm.
Arc	16,000	" "
Tungsten lamp	150	" "
Tantalum lamp	67	" "
High-pressure gas	25	" "
Carbon filament lamp	16	" "
Flame arc (with 10-inch globe)	3	" "
Low-pressure incandescent gas	3	" "
Flat-flame gas	1	" "
Kerosene lamp	0.5	" "

If we look at a lighted Tungsten lamp for a short time, when we turn away we can still see a kind of image of the filament on the field of vision. Such a phenomenon is very annoying, and a light which causes it should certainly be provided with a shade. Probably all lamps having an intrinsic brilliancy exceeding about ten to twenty candle-power per square centimetre come under this category. On this basis, although the high-pressure gas lamp is better than the metallic filament lamp, the author is firmly convinced that these should be shaded

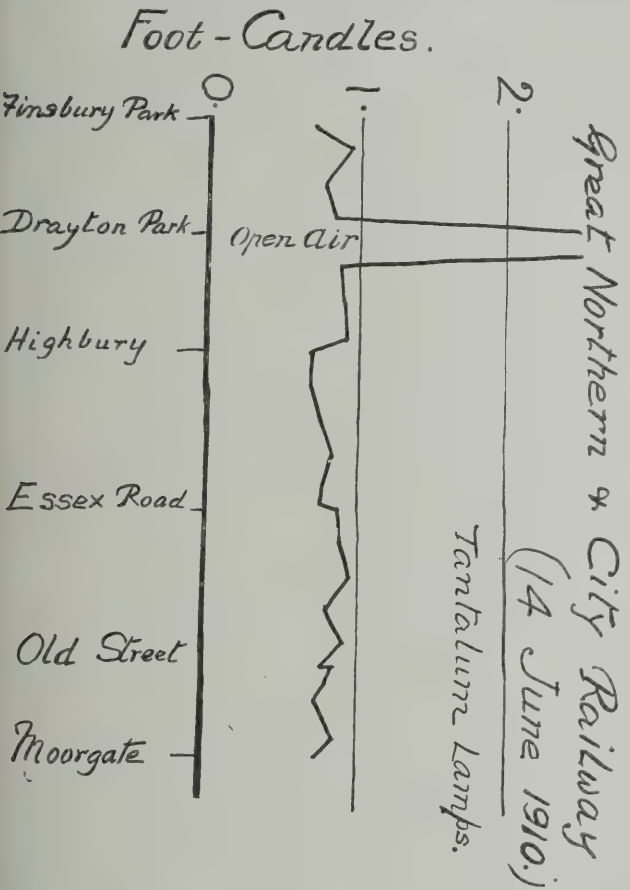

FIG. 10.

and possibly even carbon filament lamps also. Up to the present it has been the practice for gas engineers to have high-pressure gas lamps, when used for street illumination, provided with clear glass lanterns.

FLUCTUATION OF ILLUMINANTS.
The next question to be considered in connection with efficient illumination is that of fluctuation. Anyone who has had to read by an unsteady or flickering flame or by the light obtained from an electric generator driven by a badly governed water-wheel, internal-combustion engine, or other prime mover of which the speed varies to any considerable extent, will have noticed how annoying the changes of light become.

FLUCTUATIONS OF LIGHT ON ELECTRIC RAILWAYS.
With the object of ascertaining to what extent the light varies on electric railways and tramways the author took a series of journeys with one of his students to assist him on some of the principal routes in London. In each case the Trotter photometer was used, and the screen was held at about the height at which a newspaper

would ordinarily be held when being read in the train. Figs. 7 to 11 show the results of these experiments. The illumination in foot-candles is plotted on a distance base as far as could be judged by the positions of the stations.

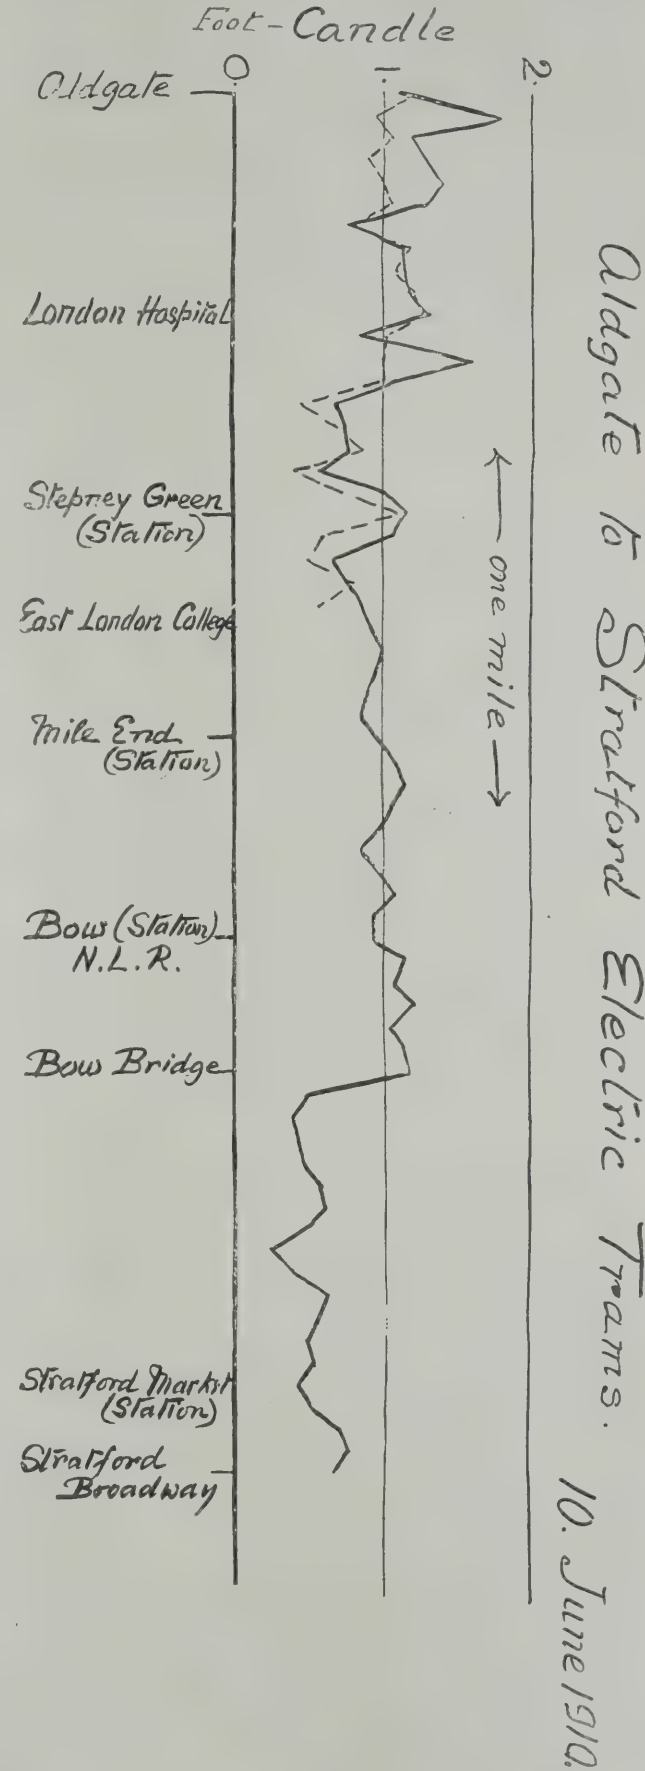

FIG. 11.

Here again the wide fluctuations will come as a surprise to many, as, excepting the very sudden changes brought about when the train starts from rest, one is not conscious of very marked variations in the light. It will be observed that, roughly speaking, the illumin-

ation in an electric train varies between one and two foot-candles. The Piccadilly Railway on the occasion of the test showed the least fluctuation, and here the average illumination was 0.9 foot-candles. Similarly it was noticed on the Central London Railway that where the illumination approached two foot-candles there was an impression of rather brilliant lighting. It can be taken, therefore, that for train lighting, provided the fluctuations are within reason, an average illumination of one foot-candle is good.

The next point to notice is the greatly reduced fluctuation where metallic filament lamps are used. The reason for this is that, whereas a variation of 1 per cent. in the voltage on a metallic filament lamp causes a variation in the light of from 4 to 5 per cent., a similar variation in the voltage applied to a carbon filament lamp causes a variation of from 6 to 7 per cent. in the light.

Some results obtained from these tests are collected in Table IX.

TABLE IX.

Magnitude of Lighting Fluctuations in Trains and Trams.

Route.	Fig.	Type of Lamp.	Illumination in Foot-candles.		
			Maximum.	Minimum.	Average.
Piccadilly Railway	8	carbon	1.7	0.55	1.0
Gt. Northern and City Ry. .	10	tantalum	0.95	0.65	0.8
Central London Railway—	9				
Eastern half	—	tantalum	1.7	0.85	1.0
Western half	—	carbon	1.8	1.3	1.6
Metropolitan District Ry .	7	carbon	2.0	1.05	1.6
Metropolitan Ry.	7	carbon	2.6	0.6	1.6
Aldgate to Stratford trams	11	carbon	1.75	0.28	1.0

The curve obtained on the Aldgate to Stratford trams shows much greater light variations than are experienced on the railways. East of Bow Bridge it will be noticed that there is an unusually large drop in the light. This is probably due to the feeding system being somewhat at fault; the author understands that this is to be remedied in the near future. In passing it may be mentioned that while the lighting at this portion of the line is certainly poor, it is by no means so bad as is tolerated on some American tramways. The author recalls how on the occasion of the International Exhibition at St. Louis the service of cars was so frequent and each car overloaded to such an extent that the lighting fell to a point where the striking of a match would have made a marked improvement.

(To be concluded.)

ROYAL ACADEMY LECTURES ON ARCHITECTURE.

THE fourth and last of the course of architectural lectures at the Royal Academy by Professor Reginald Blomfield, A.R.A., was delivered on Thursday, March 2, when the subject was "Henri IV."

The result of the civil wars had been, said Mr. Blomfield, to reduce France to a condition of unparalleled exhaustion. The nobles were impoverished, and it was reckoned in 1605 that half the properties of the kingdom had changed hands, many of them passing into the possession of the sons of wealthy tradesmen. In addition, the aristocracy no longer felt the old interest in the homes of their fathers. The architects had to reckon with the taste of a lower rank of society; of people without any particular ambition for magnificent building. The curious provincialism of French architecture at the beginning of the seventeenth century was probably due as much to this lower standard of taste as to actual impoverishment. Henri IV. and his ministers were at their wits' end to find money. Yet in the few years before his assassination the King's genius evolved those conceptions of civic architecture and of the training of artists which ultimately enabled France to establish its ascendancy over the civilised world.

Henri IV.'s first great undertaking was the completion of the gallery connecting the Louvre within the city walls with the Tuileries outside the walls. The preliminary step was to complete the little gallery, which appears to have been done in 1600. Its internal decoration was carried out under the direction of Antoine de Laval, a geographer who banished the heathen mythology of Primaticcio and his

fellows in favour of "the whole apparatus of architectural ornament, the effigies of the sixty-three kings of France, lodged each in a different portico," between the windows. Louis Metezeau is one of the four claimants to the honour of having designed part of the Grande Galerie, but it is more likely that Du Pérac was the architect. The two other names given are Plain and Fournier, but these were only builders. Du Pérac really belonged to the generation of De l'Orme, and this would explain the curious character of the design of the first part of the Grande Galerie. It is learned and scholarly, but it is trifling in scale and, compared with the works done by Bullant and De l'Orme, seems a throwback of two generations. The second part was almost certainly designed by Jacques Androuet du Cerceau the second, and he turned his back on Du Pérac's design. He used an order twice the size of that of the earlier designs, and produced work that was more attractive and even more reasonable than anything yet done at either the Louvre or the Tuileries. Despite faults, there was a largeness of treatment which carried on the tradition of Jean Bullant. Du Cerceau helped to bridge over the gap between the generation of De l'Orme and that of Lemercier and the able architects who were to make the great advance.

Not only did Henri IV. complete this gallery, but he contemplated a vast scheme for uniting the two palaces on the north side also—a scheme not carried out till the time of Napoleon III. It is a striking testimony to his genius and to the progress of French architecture made in his reign that such a conception as this "grande cour admirable" should have been possible. Henri IV. was no mere building amateur, for he built with a purpose as definite and statesmanlike as that of Augustus Caesar when he reorganised Rome in the early days of the Empire. The words of the letters patent of 1608-9 confirming the privileges of the artists of the Louvre prove that the King was deliberately endeavouring to re-establish the arts in France by collecting a number of the best workmen and most competent masters, "not only for our own use," he says, "but also that they may serve as a nursery of craftsmen who may spread the knowledge of the arts throughout our kingdom." Moreover, Henri IV. employed French artists in preference to foreigners. All his architects were Frenchmen; so too were the sculptors, except Franguevillé and Bordoni. In fact nearly all the ideas under which the modern tradition of French art has been built up originated not with Louis XIV. but with Henri IV.

The same far-seeing policy is to be traced in his various schemes for the improvement of Paris. His first object was to find work for the people whose trade had been completely disorganised by the civil wars. His second was to make Paris not only healthier and more convenient, but also the national centre of France. In the year 1600 the city's condition must have been deplorable. The streets were so narrow that even hand-carts could hardly pass between the overhanging wood and plaster houses. There were only some five or six insignificant public squares and two bridges. Every ten years there was a plague of some sort or another. Paris, says Poirson, "was little better than a common sewer" when Henri IV. took it in hand. Henri IV. was in fact the founder of France's great tradition of civic planning.

In 1600 and again in 1608 an ordinance was issued for the enlargement, alignment and paving of streets and forbidding over-hanging storeys. The Pont Neuf, with its *place* and the Samaritaine, formed the first great scheme. The present Place des Vosges was the next undertaking. The King's object was to let in light and air to the Quartier St. Antoine. The "Place Dauphine" was begun in 1607, and was intended to form a change and meeting place for merchants in the centre of the city.

The last, and on the whole the most comprehensive, enterprise was the memorable scheme of the "Porte et Place de France," whereby the national unity was to be embodied. The Place, which was entered from the north by the imposing gateway, was to consist of a semi-circular space 480 feet wide at the base, and set out with a radius of 240 feet. Round this space were set seven separate blocks of buildings of brick and stone, each divided from its neighbour by streets 36 feet wide. At a distance of 240 feet from the buildings was a street laid out concentrically with the semi-circle of the Place. The new streets were to be carried right away through Paris from north to south. Sully, the surveyor-general, started the work in 1609; but after the King's assassination it was dropped. The only record of it left is the birdseye view by Poinsart engraved in 1640.

The importance of what Henri IV. did to advance French

architecture has, said Mr. Blomfield in conclusion, been much under-rated. He was the first French King after Francois I. to take any genuine interest in the arts, and it was due to his impulse that French architecture began to recover its tone and regain its place in the line of genuine development. In the largeness of his conceptions and the statesmanlike patriotism of his aims Henri IV. was far ahead of his time.

NOTTINGHAM ARCHITECTURAL SOCIETY.

A MEETING of this Society was held on Tuesday, February 28, at 64 St. James Street, at which there was a record attendance.

In order to give members an opportunity of social intercourse Mr. A. N. Bromley, a past president, invited the members to tea, and a large number accepted his hospitality. A general meeting afterwards took place under the chairmanship of the President (Mr. Robt. Evans, junr.), and Messrs. W. Bond, L. L. Bright, E. H. Child, F. W. Gregory, F. E. Littler, and W. H. Taylor were elected members, and Messrs. H. E. Crossland and E. A. Smith were elected as associates. Other business having been disposed of, Mr. A. N. Bromley then read the following paper, entitled "Water Colour as an Aid to Architecture":—

My reason for reading a paper on this subject is to try and impress upon this Society the importance of the study of colour in conjunction with other studies necessary for the development of that art which we are proud to follow as a profession.

It may be said that an architect has so much study that it is impossible for him to become proficient in water-colour drawing as well as in other duties which he is called upon to perform, and that it is impossible for him to find time for everything.

It is somewhat difficult to reply to this statement when such subjects as construction, various styles of architecture, the study of planning of various descriptions, and a certain amount of engineering, surveying, and building law are essential. My suggestion is, therefore, that water-colours should be taken up as "a pleasure," and if this is done it will be found that not only will it become an enjoyable recreation, but it will add considerably to an architect's resources. Now I should like to point out that half the difficulty of water-colour is surmounted by good drawing, and this should be already accomplished by the architectural student. Good drawing is a serious difficulty which the ordinary student has to face, but this being already mastered by the architectural student the colour portion should soon become, without serious difficulty, both a pleasure and useful accomplishment.

Now most artists will tell you that good drawing, down to the very smallest detail, is essential to produce a good picture, and I can speak from experience that this is so, and that half the failures I have made, where muddy, unsatisfactory efforts have been produced, have been the outcome of careless drawing and from not understanding the meaning of the construction of the subject I was delineating.

Take, for instance, such things as trees and shrubs. Failure will seldom result if the tree is understood and carefully drawn.

The student is often led astray by seeing a few clever touches introduced by a master hand, which gives a better effect than even days of his own laborious work, but there should be no misunderstanding on this point. These simple touches, which are so effective, are the outcome of perfect drawing and great experience and a thorough knowledge of the subject delineated. Possibly only a shadow may be given, but behind it all is the perfect outline, which may not even be seen. I cannot, therefore, impress this too strongly, that to make a success a perfect outline must be secured, down to the very stones at your feet in the foreground, and even the weeds which may constitute a portion of it. I think one of the reasons why water-colour is not popular with architects is due to the fact that they are inclined to colour their own designs, whether they are suitable subjects or not.

It should be remembered that such subjects as public buildings and buildings of street frontages require a master hand to make them really successful, and even then only half-tones are more usually attempted. The reason of this difficulty, I think, is the fact that little variety in colour can be obtained, and the surroundings are often restricted and wanting in colour. This does not apply to country subjects where the surroundings are more congenial and are

more suitable as water-colour subjects. I am afraid our lady clients do not attach much importance to architects as colourists, and seldom consult them when it comes to the selection of delicate colours; they consider that they only should be consulted. Now, I must admit that some ladies are exceedingly clever with colour, and often produce very pleasing effects in drawing-rooms, &c. They are constantly matching colours and studying effects in dress and in the house, and they are quite at home in making delicate combinations of colour; but when it comes to the general decoration of the building the architect ought to be the director of the general scheme of colour in relation to his materials, and if he is thoroughly conversant with colour combinations he is more likely to be consulted with deference, and better results will undoubtedly be obtained. Now, my contention is that a study of water colours will prove an undoubted help in assisting the architect, not only in the completion of the interior of his buildings but also in the selection of his materials for his external work. There is every prospect that this question of colour will in the near future be a matter for much greater consideration than at the present time. The buildings in our towns at present are so disfigured by the accumulation of soot and dirt that an architect is to be excused if he gives less consideration to colour than he otherwise would; but the day is not far distant, in my opinion, when, with the rapid strides now being made with electricity, all this will be done away with, and the next generation will, I trust, look upon a new world when soot and dirt will have become a thing of the past and good architecture where colour is a feature will have an opportunity of being better appreciated. It is therefore more than ever necessary for the young student to study colour. Apart from the business side of the subject, the extra enjoyment one derives from the study is undoubtedly great.

The ever-changing beauties of nature can be almost doubly appreciated, and colour and contrasts will be noticed which have been passed over by a student who has not hitherto taken up this engrossing subject.

I am much too modest a performer myself to show you *how* to do it, but I may at least tell you *what* to avoid. It would, of course, be advisable for the student to put himself in the hands of a first-class teacher, if he can be found; if not he must then work out his own salvation.

I will give you a few suggestions as to the best way of making a start:

Good materials are not expensive, and the difference between good and bad paper may influence the student considerably. If the student makes a failure of a certain portion of the picture he may, with the aid of good thick paper, retrieve the whole situation. In the first place, he should put the drawing away for a few days, and he may come back to it with quite an inspiration for improvement. He may try first repeated washings blotted off each time with clean blotting paper, and if this fails to remedy the defect I would strongly advise the whole unsatisfactory portion of the work being scratched out when dry with a sharp knife. Success will be almost sure to follow, as it will be known exactly what strength and tone of colour is required, and this will be washed in with confidence. The colour being placed on the paper at its full value a successful and perhaps brilliant effect will be secured, and the picture which yesterday was a disappointment may become a real pleasure to-morrow.

I suggest the following moist colours:—Cobalt, indigo, Antwerp blue, yellow ochre, cadmium, aureolin, rose and brown madder, raw and burnt sienna, light red, sepia, Van Dyke brown, and Payne's grey. Brushes of the best—not too small. My strong advice is, therefore, start with the *best* materials, draw the outlines carefully and thoroughly, and never give in.

The student must decide for himself what method of finish he should give to his picture. We all admire a dashing broad style, but I think the beginner should refrain from copying this style, at any rate at first, or carelessness will result. On the other hand, a finicky way may be acquired by introducing too much detail. It is indeed difficult to draw the line.

The beginner should be carefully cautioned against getting into a way of working in a smooth tea-tray style. This is often the outcome of working one colour over the other with too dry a brush, and all texture is lost. It also emanates from want of confidence, and sometimes insufficient drawing. I should therefore strongly recommend a full brush of colour being used; large full decided washes are the best which take a long time to dry. Softening should be avoided, and the sharp end of the colour should be left

where possible. When a tint must be added to, then the very greatest care should be given to placing the second tint upon the first, with the utmost delicacy, or the undertone will be rubbed up and a muddy, unsatisfactory effect will be produced.

The beginner's picture will be almost certain to lack variety, and he will be conscious himself of something dull and insipid. This will be caused by lack of variety. Nature abhors sameness, and even surfaces of colour which appear at first sight to be all one tint are, if carefully examined, full of variety, and it is the real artist who seizes upon these variations and emphasises them to bring them into his picture.

We now come to a very vexed question—namely, as to how much an artist should paint exactly what he sees.

A picture is a somewhat ideal rendering of one's impressions, but there is a great danger of carrying this too far, and if this is done the artist will be justly accused of trickiness. On the other hand, if he paints just what he sees, from foreground to sky, he may just miss making a beautiful picture.

Some pictures, however, are so palpably made up that one detects that they have been made up in the studio to a very large extent, and all interest is lost. I think you will agree, therefore, that the medium course is the best.

The following books will be found very useful to beginners:—A. Penley, Thomas Hatton, Thomas Rowbotham, and John MacWhirter. Many of the combinations of colour suggested by Penley are an undoubted help to a beginner.

Distance colours should be carefully studied, as they assist materially in giving depth to a picture. Colours such as yellow ochre, cobalt and the madders are very useful for distances.

Of all things green pictures are to be avoided, although some clever artists seem to be very successful with them, but they require strong contrasts to make them successful. I should, therefore, recommend the beginner to tone down his greens and bring out the warmer colours in nature to the fullest extent.

The sky will often be a trouble to the beginner, and I should recommend the architectural student to keep the sky quiet and grey in tone, with a little blue between the clouds.

Trees are so associated with architecture that they will be found to be worth studying carefully, and indeed they are almost part of the design of a country building.

Certain trees seem to suit certain styles of architecture.

N. E. Green's book on trees will be found very useful, although I do not agree with adding in the first instance one shade of the same colour over the other; in fact the architectural student should be specially cautioned to avoid this method of working not only in trees but in everything. A shadow is cooler than the high light, and although darker, is of a different colour from that in light. I much prefer Rowbotham's system for trees of mixing the shadows with the high lights of almost the full strength required, the shadows being, of course, cooler than the high lights. The two shades should be run together wet and mingling one with the other often produce very beautiful effects.

A common mistake with the beginner is to colour the tree first and touch in some branches afterwards. This should be reversed, and the delicate taper of the branches should be carefully drawn first, the tree being clothed with foliage afterwards, and the character of the particular leaf delineated, but on no account should too many leaves be indicated.

Foregrounds are frequently neglected, and the picture spoilt in consequence. It should be remembered that the foreground must of necessity take up a large portion of the picture, as a garden does of a house. There is often much wealth of colour in a foreground, and a little care in arranging it is well worth the trouble.

We now come to perhaps the most important detail connected with colour as it relates to an architect and his work, viz., the contrast of colour. If we study nature carefully, it will be found that she provides many beautiful natural contrasts, viz., red and green, yellow and purple, and orange and blue. Hatton points out:—"A sunset on the sea will often light up the sky with a rose colour, and the surface of the sea will show a greenish tone. At sunset yellow lights will also be thrown upon white buildings, which will give purple shadows," and these contrasts I have frequently noticed; but they, if in immediate contact and unless divided by another medium, are not always pleasing. For instance, I myself could never appreciate green windows and doors to a red brick building, but if a door-frame is painted white and the door green the contrast of green with the red at once becomes satisfactory.

I am afraid I have kept you too long, but the subject is a very fascinating one, and if I have done something to interest the members of this Society and persuaded them to give water colour a trial I shall feel then that no apology is necessary.

To illustrate his remarks Mr. Bromley exhibited on the walls a number of his own water-colours, the variety and delicacy of which were much admired; and he also handed round for inspection water-colours by various artists. In the discussion which followed Mr. Wallis, the curator of the Castle Art Museum, strongly condemned the impressionist style of painting as being a bad training for any art student.

Various questions having been answered, Mr. Sutton said they were greatly indebted to Mr. Bromley for his extremely practical and interesting paper. They also greatly appreciated his kindness in asking them to tea, and he offered Mr. Bromley their best thanks. The President, in submitting this to the meeting, remarked that the Nottingham Society had advanced rapidly during the past few years, and he was sure they were all impressed with the excellence of the paper read that evening.

ST. PAUL'S AND THE BRIDGES.

AN illustrated lecture was given on Thursday of last week at Carpenters' Hall by Professor Beresford Pite under the above title. The architectural assets of London were, he said, neither few nor mean; its vast collection of buildings included very many of individual value, and quite a considerable number of them were of supreme interest and decided beauty. London might perhaps be said to resemble the annual summer exhibition of the Royal Academy in that as a collection it is indigestible in quantity and individually uneven in quality. Unlike the Royal Academy, there was no preliminary approval required for the buildings of London providing for only the survival of the fittest. Nevertheless, there were in the midst of the metropolis as fine examples as are possessed by any capital of the world, whether castle for castle, cathedral for cathedral, an abbey of unrivalled beauty, chambers of legislature worthy of a world-wide Empire, and houses of a peculiar charm. All these things only need a separation from the time of their erection in order that their many qualities may be recognised and rightly praised. Let Londoners take heart as they think of such a group of mediæval monuments as Westminster Abbey, Westminster Hall with its glorious roof, the Tower, Temple Church, St. Mary Overbury, Southwark. These afforded enough Gothic art to be worthy of a pilgrimage by a Gothic enthusiast. Of the Renaissance period there are splendid early examples no less than of its late ones.

Liberty-loving Britons need to be taught the artistic blessedness of architectural despotism. The limits of the greatest achievement of modern ideals are the great municipal improvements. The river Thames provides the metropolis with a thoroughfare 1,000 feet in breadth which has scale and grandeur of line. We now hold such a position that without vanity our architectural horns may be lifted up and trumpets of defiance blown to the Continent. The effort of taking stock of the architectural beauties is worth making. It might be asked, "Is there not such an overwhelming amount of bricks and mortar that it would be vain to claim an architectural character for the aggregate?" It would be admitted to be possible for one dominating monument to control and impress a wide area of uninteresting landscape and reduce to breadth and scale an indefinite number of buildings. This is done for London by St. Paul's and the Thames.

What the Acropolis with its temple was to Athens St. Paul's, seated upon the top of Ludgate Hill, is to London. It might be asked again, "Is the scale of the church sufficient for the almost unlimited size of the city; has not the extraordinary development of the metropolis destroyed any possible relation in the scale of a cathedral planned two and a half centuries ago?" The answer is that St. Paul's is on a scale which can still dominate London. No one had ever averred that either the mammoth Crystal Palace or the huge and wonderful shell of St. Pancras Station had displaced the centre of the metropolis or supplanted the majesty of the amazing and simple dome which is worn crown-like upon the forehead of Ludgate Hill. But the greatest proof of the dome of St. Paul's being the embodiment of an ideal is that it exercises a practically universal appeal, and we may well doubt the mental equipment of anyone who is unmoved by it. The present Bishop of London truly said some years ago that the dome preached a greater sermon than

any words preached beneath it. Turner uttered a great truth when he said that St. Paul's was London.

The pilgrim in search of the beautiful may well be advised to ride on the outside of an omnibus going down Fleet Street and view St. Paul's on the ascent of Ludgate Hill. Even the somewhat awkward railway bridge adds a piquancy to the effect as a train steams across it.

Professor Pite then showed on the screen a series of views to suggest the effect of domes and water. Greenwich Hospital has an extraordinarily beautiful combination in the domes and the river. The Custom House at Dublin is one of those many exceedingly fine architectural groups possessed by the city which makes one's mind torn with doubt as to whether Edinburgh is really the most beautiful city of the Empire. The Trinity Bridge, Florence, is remarkable for its considered grace of outline. Other views showed Notre Dame, Paris, Newton Bridge, Cambridge, and Alexander III. Bridge, Paris. In displaying a design for a bridge across the Tiber made by Piranesi in the eighteenth century, Professor Pite suggested that a magnificent bridge of that character would be a worthy memorial to a great Sovereign and worthy of a great Empire and of a great capital. Although ardent mediævalists might wish for a mediæval bridge, one of that character would be impossible.

London possesses at least twenty bridges; of these, fourteen are public road bridges and seven are for railways. All have been erected within the past century, beginning with Waterloo Bridge and concluding with Vauxhall Bridge. The railway bridges belonged to the second half of the century. One could pass the bridges of the world in review without finding a pair of successful rivals to those works of the nineteenth century—to which due recognition had not been afforded—viz., Waterloo Bridge (completed in 1817) and London Bridge (finished in 1831).

In referring to the proposals for the new bridge, Professor Pite said he wanted to suggest how fine it would be to take a photograph of Waterloo Bridge and place it upon a photograph of St. Paul's from the river. There was only one place for such a bridge, only one site, upon which an architecturally noble causeway could be placed, and that was upon the centre of the axis of the cathedral. With the river and the cupola, and with the necessary width of some 80 to 90 feet, London would be in a position to offer a view unequalled by St. Peter's at Rome, and perhaps surpassing the fondest dreams of Wren's imagination. When Wren built St. Paul's old London Bridge was standing, and he planned his city with lines of noble access to the front and flanks of the cathedral. The opportunity had now come with our greater skill to throw a causeway across the river that would dignify the city, glorify St. Paul's, and crown London with a worthy architectural achievement. There was ample warning as well as encouragement in London's bridges. We have a heritage of extraordinary and wonderful architectural wealth to which we should awake, and of which we should entertain a proper appreciation on the highest public grounds. We have a river of extraordinarily beautiful proportions, in its magnificent width, in its grandly-curving plan. We have a cathedral upon a hill in the very arc of this river, and we want a bridge. "May our visions," said Professor Pite, "turn again towards the glories of London and Waterloo Bridges, and place such a grand causeway opposite to and leading up to and completing the scene at St. Paul's Cathedral!"

Professor Beresford Pite concluded by showing a series of photographs on the bridges, commencing with the Tower Bridge and ending with the suspension bridge at Hammer-smith. Each slide was accompanied by historical and critical notes.

MANCHESTER SOCIETY OF ARCHITECTS.

At the meeting held on Wednesday, March 8, Mr. J. H. Sellers read a paper on "The Architect's Use of a Library."

There are some people, Mr. Sellers said, to whom a library is dull and uninspiring. To architects it could be a great inspiration and help. There is no better relaxation than to turn from the drawing-board to one's books—"books," as Gissing said, "gentle and quieting books, noble and inspiring books, that will merit to be pored over not once but many a time." They would point out the true, if narrow, path.

It is doubtful if the old architects understood the history of art as we understand it to-day. If Wren could have studied the folios of Greek work we might have seen St. Stephen's, Walbrook, with the mouldings as refined and

the ornament as delicate as Greek work. Knowledge of history impresses upon us the fact that great styles are based on reason and logical construction, that buildings must fulfil their purpose. To know the history of architecture well we must know the history of the people, their religion, their commerce; we must trace out the intermingling of tribes and nations. Wide reading would bring us to this knowledge, and would aid us in the formation of an artistic character and a power of æsthetic reasoning. Architects should strive after culture in its true sense; not artificial or superficial accomplishment, but the natural and inevitable process by which a man comes into possession of his own nature and into a real and fruitful relation with the world about him; not the possession of information, but the absorption of knowledge such as would enable them to reject the untruthful, and to pass by the trimmings of styles that are dead. Too many books are written on taste, "What is Art?" and so forth. They were unprofitable and wearisome, and often the work of amateurs who do not practice, and are unable to put themselves into the position of the worker, and who read into buildings motives and causes which seldom had any existence.

Students should read great books—the Bible, the works of Shakespeare, Milton, Walter Pater, Ruskin, and Dante. They would lift us above thoughtlessness in our work, till we should "see visions of colour and light, of green fields and broad rivers, of palaces laid with fair colours, and gardens where a place is found for rosemary and rue."

UNIVERSITY OF LONDON LECTURES ON ARCHITECTURE.

EARLY Christian architecture was discussed by Mr. Banister Fletcher, at the British Museum, on Tuesday, February 28, aided by many beautiful views.

Rome was the great centre from which Christianity spread throughout the whole of the civilised world. The Emperor Constantine accorded to Christianity equal rights with other religions in the year 313 A.D., himself professing the Faith ten years later, and causing it to be adopted by the State.

In 324 he removed his capital from Rome to Byzantium; later, in the year 364, the division of the Roman Empire took place, Valentinian becoming Emperor of the West, and his brother Valens Emperor of the East. In 376 the Teutonic invasion of Italy began, but in 379 the Goths were partly driven out and partly subjugated to Rome by the Emperor Theodosius, under whom the Empires of the East and West were once more re-united, Constantinople being the capital.

The relations between the East and West are accountable for the strong influence that Byzantine art had upon early Christian art in general. Ravenna, owing to its situation on the coast and to the fact that it was the seat of the Exarch, or Vicegerent of the Byzantine Roman Emperor, more especially felt its influence, and it is probable that much of the work found here was in many cases executed by Greek workmen brought straight from Constantinople.

The early Christian period is generally taken as lasting from the time of Constantine, A.D. 313, to 1000. In the year 800 Charlemagne was crowned in Rome, the Holy Roman Empire dating from this period and the title being retained until the year 1800.

The temples of the Roman deities were often very small, being built merely as shrines to shelter the statue of a god or goddess, whereas the churches of the early Christians were erected to shelter a congregation, so that although in some instances actual pagan temples were converted to Christian uses, the type of building found to be most suitable to the needs of the new religion was the Roman basilica, or Hall of Justice. The existing buildings were not actually used for religious services, as these naturally were required for the purposes for which they had been built, but new halls, or basilican churches were erected for this special purpose.

The early Christians having been a much persecuted sect had but little money at their command, and when at last they were allowed the free practice of their religion they adapted and used any material at hand; thus we find in their churches old columns with capitals of various design, which had formerly been imported into Rome by thousands from every part of the Empire to adorn the pagan temples, used in a haphazard manner, regardless even of the length of the shaft, deficiencies in this respect being supplied by extra high bases, additional blocks of marble, or the entire omission of the base mouldings if too long. In Rome there

were over thirty early Christian churches, and most of them are still in existence.

In regard to the plan of the basilican church, it is thought by some to have been influenced by the Roman dwelling-house. The church of S. Clemente, Rome, dating originally from the fifth century, but rebuilt in the eleventh, is a typical example. Undoubtedly in early times the Christians would meet together for their services in the houses of their richer brethren, and those features which were found useful would be retained. The peristyle of the Roman house would appear to survive in the atrium surrounded by arcades of the basilican church, with its fountain for ablutions in the centre. The narthex was a covered narrow portion dividing the atrium from the church, and beyond which the catechumens were not admitted.

The church itself was planned exactly like a Roman basilica, having a wide nave, with aisles sometimes double; long rows of closely spaced columns which in the earlier examples supported an entablature; above this was a flat clerestory wall which was generally ornamented with mosaic, above which were the windows admitting light to the interior. In the later examples the columns were placed further apart and supported semi-circular arches which sprang direct from the column.

The early Christian basilican church was usually covered with a timber roof, thus differing from the later vaulted type of the Byzantine period.

At the end of the nave was a semi-circular apse with the bishop's throne in the centre occupying the position of the seat of the prætor in a Roman basilica; on either side, where in the hall of justice the assessors sat, were seats for the presbyters or members of the Council of the early Church. In the centre of the apse where the pagan altar stood was the altar for the Christian service, the priest or bishop officiating from the apse looking towards the nave, a custom retained to this day at St. Peter's in Rome, and all old basilican churches where the Bishop's throne has not been removed to the side but left in the centre of the apse.

Towards the fifth century, instead of facing the nave as hitherto, the priest officiated with his back to the congregation. For many centuries the altar was merely a table covered with a white cloth; the crucifix, a number of candles, and high screen only crept in little by little when the officiating priest no longer faced the congregation. The earliest example of this change of the priest's position is to be found in the church of St. Apollinare Nuovo at Ravenna.

The choir was separated from the nave by low walls or screens called cancelli, from which our own word "chancel" is derived. Within the screens, on either side, the two reading desks were placed, the Epistle ambo and the Gospel ambo; these were brought down from their original position on the immediate right and left of the altar in order that the Holy Scriptures might the better be heard by the faithful. This change also probably took place somewhere about the fifth century, together with the removal of the Bishop's throne from the centre of the apse to the side.

The upper part of the walls was usually lined with brilliantly coloured glass mosaic representing various scenes from the New Testament or lives of the Saints, whose symbolic emblems became quite an important feature in decorative art.

Openings were semi-circular, as seen in the church of S. Maria in Cosmedin (rebuilt 772), where the clerestory windows are round headed, and where the arches in the nave spring direct from the columns. When mouldings were used and designed afresh, they were merely a variation on the old Roman types. The pavement in S. Giovanni in Laterano has a geometrical design in marble; slices of old columns are used as centres, which are surrounded by bands twisted into intricate designs.

To illustrate these various features of early Christian art the lecturer showed views of the following churches with which he dealt in fuller detail than space here permits:—The church of S. Clemente, Rome, originally built in the fifth century and rebuilt in 1108; S. Paolo fuori le Mura, 380, rebuilt nineteenth century; S. Maria in Cosmedin, rebuilt 772; S. Sabina, Rome, 425; S. Maria in Trastevere, rebuilt twelfth century; S. Maria in Dominica, 817; S. Giovanni in Laterano, fourth century; S. Prassede, Rome, 827-24; S. Lorenzo fuori le Mura, 335, rebuilt 1216; the old basilican church of S. Peter's, Rome, erected by Constantine near the site of the martyrdom of S. Peter, which took place in the year 67 in the Circus of Caligula and Nero; S. Maria Maggiore; S. Agnese fuori le Mura, founded by Constantine; S. Maria in Ara Coeli; and S. Giorgio at Velabro.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

AT a general meeting of the Society held on Thursday, 9th inst., when Mr. Sydney D. Kitson, F.R.I.B.A. (president), occupied the chair, Mr. W. H. Ward, A.R.I.B.A., read a paper on "The Renaissance Church Architecture of the Sixteenth Century in France."

It was a commonplace, he said, that the history of architecture was in most countries and ages the history of religious architecture. In the Middle Ages if church architecture were eliminated nothing coherent or, indeed, very important would be left. But at the time of the Renaissance western Europe had largely outgrown the tutelage of the Church, the idea of nationality was developing, and in England, Spain, and France the focus of national life was becoming a strong centralised monarchy.

The architectural expression of this state of affairs was to be found, therefore, in secular buildings and more particularly in the dwellings of the Sovereign and his Court. The architecture of France in the sixteenth century was essentially an architecture of châteaux, of the pleasure houses of a still half-feudal aristocracy.

Thus it was much more difficult to present a picture of church architecture of this period than of contemporary secular architecture, and excepting a short list of approximately complete buildings a history of the style must be compiled chiefly from additions and embellishments to Gothic churches; here a chapel, there a transept, elsewhere a vault or a portal, a tomb, a screen, or a rearedos.

St. Eustache, Paris, begun in 1532, was the largest and completest Renaissance church of the century in France, and although practically identical in plan with Notre Dame, it was designed as a whole from the first as a Renaissance building, its Gothic features being clothed with detail inspired from Italian sources.

The lecturer broadly analysed and compared the various parts of this church with contemporary examples elsewhere, and by means of a series of some sixty slides traced the gradual spread of Renaissance ideas—first in the detail and later in the general design—over the ecclesiastical architecture of France.

At the close, and on the motion of Mr. W. H. Thorp, F.R.I.B.A., seconded by Mr. J. H. Farrar, a hearty vote of thanks was accorded Mr. Ward for his paper.

OUR CONTEMPORARIES FROM OVERSEAS.

THE *American Architect* (New York) reproduces working drawings of some recent buildings by Mr. Donn Barber—the new Mutual Bank building, New York, and the Capital City Club, Atlanta, Ga. Photographic views are also given of the Technical High School, Newton, Mass., by Mr. George F. Newton; of the Dormitory, Pennsylvania College for Women, by Messrs. Alden & Harlow; and of the Shari Zedek Synagogue, Brooklyn, N.Y., by Mr. Eugene Schoen. An interesting illustrated article on "The Modelled Relief in Decoration" shows how sculpture is being associated with architecture in modern American buildings.

The *Architectural Record* (New York) has for its chief items illustrated articles on the United States Post Office, Custom House, and Court House, Cleveland, Ohio, of which Mr. Arnold W. Brunner is the architect; and on recent Philadelphia architecture, divided into two sections, City Buildings and the Suburban Dwelling and Country Villa. Mr. G. A. T. Middleton's series of articles on "The Evolution of Architectural Ornament" is concluded this month.

Berliner Architekturwelt (Berlin) tells a tale of what befell in a suburban competition, strictly limited to residents, which shows that even in Berlin all is not perfection in the competition arena. The two premiated designs for an Oberrealschule at Zehlendorf are illustrated. Two of the smaller new bridges of Berlin, one in stone the other in iron, the Brommy and the Köthener, are very good. Several examples of both town and country houses are illustrated.

La Construction Moderne (Paris) illustrates Felix Charpentier's monumental fountain, "Source Humaine," which was exhibited in last year's Salon des Artistes Français.

Moderne Bauformen (Stuttgart) is this month a monograph of the work of Stadthaurat Professor Hans Erlwein in the city of Dresden, the most important buildings being the new abattoirs and cattle market and a high school for girls. Professor Erlwein's work is notable for its restraint and dignity.

FORTHCOMING EVENTS.

<i>Monday, March 27.</i>
Royal Institute of British Architects : Business Meeting ; Election of Members.
<i>Tuesday, March 28.</i>
Nottingham Architectural Society : Social Evening and Award of Prizes.
<i>Wednesday, March 29.</i>
Carpenters' Company : Professor W. R. Colton, A.R.A., on "The Decorative Uses of Sculpture."
Royal Society of Arts : Mr. G. B. Heming on "Art Education in Jewellery, Goldsmithing and Allied Trades."
Edinburgh Architectural Society : Associate Meeting and Debate.
<i>Thursday, March 30.</i>
Architectural Association : Camera, Sketch and Debate Club Meeting ; Mr. H. W. Wills on "That Socialism means the Extinction of Fine Architecture."
<i>Friday, March 31.</i>
The Leicester and Leicestershire Society of Architects : Students' Evening.

THE ARCHITECTURAL ASSOCIATION SKETCH BOOK.

THE outstanding characteristic of the volume of the Architectural Association Sketch Book for 1910 is its value as a work of reference. A volume which at the price of one guinea contains amongst its seventy-two plates carefully-measured and well-executed drawings of the West Portico and Wellington Monument from St. Paul's Cathedral and the Church of Santa Sophia, Constantinople, is by this alone justified as a valuable work of reference.

But these subjects do not by a long way exhaust the measure of the more than ample return for the money that is presented by the contents of one volume of the A.A. Sketch Book. Work of a wide range of date is included, from the Tomb of Mausolus at Halicarnassos, assigned to B.C. 353, to the nineteenth-century Wellington Monument in St. Paul's Cathedral. Hence, the A.A. Sketch Book maintains its high position as a *répertoire* of information for the student of architecture. The pre-eminence of this position is due very largely to the high proportion of measured drawings compared with sketches that is preserved in the present volume.

A valuable feature in connection with the measured drawings is that the Editors, MESSRS. GERALD C. HORSLEY, THEODORE FYFE, and W. CURTIS GREEN, have not scrupled to devote several plates to the adequate illustration of individual subjects. Thus we find five plates devoted to Borwick Hall, Lancashire; four plates to the entrance gateway of the Abbey of St. Edmund, Bury St. Edmunds, Suffolk; three plates to the Church of St. Peter, Claypole, Lincolnshire; six plates to the Wellington Monument; five plates to the West Portico of St. Paul's Cathedral; five plates to the Church of St. Peter, Peterstone, Monmouth; four plates to Sompting Church, Sussex; five plates to the Hôtel Carnavalet, Paris; three plates to the Church of SS. Sergius and Bacchus, Constantinople; and five plates to Santa Sophia, Constantinople. Each of these buildings is thus placed thoroughly and completely on record. As regards local distribution of the subjects forty-one plates are devoted to English buildings, nine plates to French, nine to Italian, and thirteen to architecture in Turkish lands.

Of the buildings to which considerable space is given, Borwick Hall, measured by Mr. F. H. SWINDELLS, is a typical Lancashire manor house of some importance and of the date A.D. 1560-1650, stone built and retaining much of its internal panelling and other fittings. The Abbey gateway at Bury St. Edmunds is a well-known fourteenth-century work, thoroughly illustrated by Mr. P. D. HEPWORTH. The Church of St. Peter, Claypole, is drawn by Mr. J. L. BERRY, and the date is given as thirteenth to seventeenth century. The plan shows a collegiate type of chancel and curious later extensions of the

north and south aisles of the nave. A finely-proportioned albeit somewhat slender tower and spire is at the west end and the whole church is one well worthy of study. The Church of St. Peter, Peterstone, is described by the author, Mr. W. ARTHUR RUTTER, as Late Decorated and Perpendicular, but the chancel and vestry are modern. This church has the usual western tower, the battlemented parapet of which is a good piece of design. The interesting Saxon church of Sompting, although considerably rebuilt and altered in later times, is well known as one of the most valuable pieces of evidence of the Early Romanesque period in England, and the thanks of antiquarians are due to Mr. F. A. CROUCH for his careful measurements. The Hôtel Carnavalet, by FRANCOIS MANSART, A.D. 1661, has been measured and well drawn by Mr. CYRIL A. FAREY and affords a good opportunity of comparison with the work of WREN at St. Paul's in the same volume. The Byzantine examples of the Church of SS. Sergius and Bacchus and of Santa Sophia, the former drawn by Mr. A. E. HENDERSON and the latter by Mr. J. B. FULTON, are particularly useful for study of the articulation and composition of these salient examples of the domed architecture of the sixth century in Eastern Europe.

The practice of including R.I.B.A. Studentship drawings in the A.A. Sketch Book is the cause of the reproduction of measured drawings of St. Peter's Church, Claypole; St. Peter's Church, Howden; St. Leonard's Chapel, Kirkstead; Rood Screen in Kenton Church, South Devon; the Steeple of St. Bride's Church, London; the Wellington Monument and the West Portico from St. Paul's Cathedral; the Hôtel Carnavalet; and perspectives of the Library of Trinity College, Cambridge, and Santa Maria della Carceri, at Prato, a total of nineteen plates.

The fashion for tinting measured drawings which prevails amongst present-day students, due no doubt to French influence in the representation of Classic and Renaissance architecture, is an unfortunate one from an A.A. Sketch Book point of view, as in the process of reproduction clearness, one of the first essentials of a measured drawing, especially when reduced in size, is sacrificed to a most regrettable extent. Perhaps the drawing above all others, though not a measured drawing, which has suffered in reproduction is Mr. ERNEST GEORGE's water colour of the Rialto bridge, which is now but a collection of meaningless splotches and falsified values. A better result might possibly have been obtained by a happier selection of tint, but the translation of water colour into monochrome is an operation that requires a considerable amount of judgment, knowledge and skill if even a moderate degree of success is to be attained. Plate No. 6 and the drawings of the Wellington Monument are instances in which the value of the measure-

MINARET IN CAIRO.

ment is largely obscured in reproduction by the overpowering insistence of the tinting. Comparison of these with the drawings of St. Peter's Church, Peterstone, attests the indubitable superiority of simple black line for measured drawings that are to be reproduced on a reduced scale. The present volume is less rich in specimens of fine draughtsmanship than have been some of those of preceding years, but Mr. HEPWORTH's pencil study of the Portail des Libraires at Rouen Cathedral and his detail from the Bury St. Edmunds gateway are good, and Mr. F. L. GRIGGS contributes two notable pencil drawings from Cambridge and Ely.

THE SALTING COLLECTION.

THE magnificent collection bequeathed by the late Mr. GEORGE SALTING to the Victoria and Albert Museum has now been arranged in accordance with the testator's wishes—"kept altogether according to the various specialities of my exhibits." The salient characteristic of the collection is the uniformly high standard of the various items included. Therefore, from the standpoint of a student who aims at designing or producing artistic things which he may reasonably hope will to-day find purchasers, the SALTING collection of *objets de luxe* represents rather the unattainable ideal for which he may vainly hope to obtain commissions than examples of the class of work for which he may expect to find a ready market. Only a millionaire could afford to fill his house with furniture and equipment of the quality that is here displayed.

The scope of the collection is an exceedingly wide one and embraces examples of practically the whole of the artistic crafts in every material; metal, wood, stone, pottery, glass, ivory, textiles, all are included, together with miniatures and engravings. And in each department we have the work of the best masters and often specimens of their best work.

Thus in the case of bronzes we have not only several examples of the work of the greatest of the Paduan bronzefounders, ANDREA BRIOSCO (1470-1532), but what is perhaps the finest example of the same master's equestrian groups—a warrior in richly-decorated armour seated bareback on a wonderfully-modelled horse. The Italian

bronzes as a whole are splendid specimens of the best work of the fifteenth and sixteenth centuries. A specialised group of metalcraft of the same period, to which, by the way, Mr. SALTING seems to have devoted especial attention, is that of medal-making, and here the collection is very remarkable. Although the largest portion of the SALTING collection of medals comes from Italian workshops there are sufficient specimens of German and French craftsmanship to afford a fair basis of comparison and study. Somewhat akin to medals are plaquettes, which may indeed be defined as medals of other than purely circular form and intended for incorporation in objects of utility or ornament.

Very interesting from an architectural point of view are some wrought-iron locks, keys, and caskets of fifteenth to seventeenth-century date.

Woodwork is not for the most part in this collection closely related to architecture, being principally illustrated by sumptuous articles of furniture, which we might describe as being too magnificent to live with, splendid examples no doubt of the expenditure of labour and artistic design, but who wants to live with furniture so covered with carving that there is scarcely an inch of plain, honest wood to be seen? We must except from this general criticism a couple of walnut panels from the district of Bresse, near Lyons—French work of the early sixteenth century, which are clearly of ecclesiastical origin and contain some excellent wood-carving both of conventional ornament and of figure-work in angels holding heraldic shields.

There are a few examples of beautiful jewellery work, including ecclesiastical as well as personal adornments; amongst the ivory carvings are some good examples of pastoral staffs, diptychs and other ecclesiastical accessories.

A considerable portion of the space allotted to the SALTING collection is devoted to Chinese and Japanese art, of which there are many examples of pottery, of metal-work, and of carving in wood and ivory, as well as of lacquer. The Chinese bronzes also include examples ranging in age from perhaps as early as a thousand years before the Christian era to the eighteenth century A.D. Of Japanese bronze-work there are also specimens, mostly of the work of the Seimin school, which flourished during the first three-quarters of the nineteenth century.

NOTES AND COMMENTS.

ARCHITECTURE is to receive its usual British treatment in the British Fine Art Palace at the Rome Exhibition this year to celebrate the jubilee of the United Kingdom of Italy. It is placed on an equality with black and white drawing, and is allotted 1,800 feet super. Sculpture has 3,600 feet super and painting 18,000 feet super. And architecture is politely termed the "Mistress Art." On the Continent there is an intelligent appreciation of architecture as an art. What will Europe think of British architecture which is thus relegated to the back-most of back seats?

THIS is the official description of the show of British architecture: "The Architectural Section illustrates the advance that has been made in domestic architecture in the more noteworthy buildings erected throughout the kingdom, and in such attempts at town-planning as have been permitted by an hitherto unenterprising nation." That is a nice epitome of the position of British architecture at the present day. We are thankful to be told that we have made an advance in domestic architecture, but we humbly prefer the advance in other spheres of the art which we fancy has been manifested in the designs for Liverpool Cathedral, the Wesleyan House at Westminster, Cardiff, and a dozen (at least) other municipal buildings. But we are not surprised. We understand that the Chairman of the Royal Commission which has organised the British sections in both Rome and Turin is Lord LYTTON.

THE President of the Royal Institute offers the services of that body to assist the artists who have generously made a proposal to prepare a scheme of decoration for the route of the Coronation procession, and refers to the part taken by INIGO JONES and Sir CHRISTOPHER WREN in designing triumphal arches for the purpose of great Royal processions. Now, a procession that is to be a successful pageant consists of two parts, the *mise-en-scène* and the cavalcade. While we think that architectural advice is desirable for the former, we must recognise that painters are particularly fitted to arrange the latter, but to produce an entirely harmonious effect, both must work together.

A VERY nice little handbook to Oxford has been prepared by EDWARD C. ALDEN, in which the historical, descriptive, and pictorial aspects of the University and City are treated in a manner that is not too abstruse for the amateur and sufficiently informative for the professional visitor, the notes on Oxford architecture being concise and yet critical.

PROBABLY not many of our readers are aware that "sunprints" have hitherto been produced almost wholly on paper "made in Germany," or at any rate of foreign origin. But this is not all. These alien papers are of very indifferent keeping qualities, and the architect who does not use up his paper soon after it is bought finds that he cannot get good prints from old stock. Therefore we are glad to have become acquainted with the Technical Paper Company, who supply paper which they assure us is "all-British," and for which they are ready to give a two years' guarantee. The papers the Company have at present on the market are ferro-prussiate, ferro-gallic, and an aquatone or sepia paper, and they are willing to supply either small or large quantities or to make sunprints.

METAL WORK.*

(Official Report.)

By MR. W. BAINBRIDGE REYNOLDS.

THE subject on which I am to speak to-night, viz. decorative metal work, is so large, that I fear I cannot in the time at our disposal attempt any comprehensive review of the theme, either from the historical point of view, or from that of the principles of design. The purposes to which the various metals lend themselves for decorative treatment are many, and the forms of design employed during the centuries of their use are just as numerous, so that a systematic commentary on the subject could only be kept within the limit of a long treatise.

I propose therefore this evening only to show you a collection of photographs, some of examples of various dates which appear to me to possess those qualities which make for beauty, and some of modern work with which I have myself been connected as designer and maker. With regard to several of the photographs I have made some rather random notes, which I hope may be of some interest.

The construction of supports for lights for artificial illumination has been in all ages confined principally to metal, either in a form suitable for suspension, or for projecting from walls, or for standing on floor, table, or ground. The evolution of lighting media from simple and primitive oil lamps, thence to candles, later to gas, and finally to electric light has involved from time to time new conditions and problems in design and construction.

The design of the supports for the light or lights for internal illumination depends primarily on their position in the space to be lighted, having regard to convenience and appropriateness.

In mediæval times the aim in the artificial lighting of churches was not, as it seems to be to-day, to cause an equal diffusion of light. Churches were then lighted with a view to æsthetic effect rather than to practical illumination. Light was obtained from very few points in the nave so that the shadows were cast in the aisles and transepts, thus giving the air of mystery which was sought by the old builders of churches, and at the same time enhancing the architectural effect. There were, no doubt, small lights in aisles and transepts, and in front of shrines and benediction

crosses. These added to the mystery of the gloom in the shadows. It is true that in those days there were no printed books, and the laity who assembled for worship and praise used a liturgy, psalms, and hymns, more or less well-known by heart, so that the practical illumination of a church was unimportant. It is a question whether in churches of the present day, at any rate those of the Anglicans, Roman Catholics, and Greek Catholics, where the liturgy should be known to the congregation, the modern system of uniform illumination does not make too much sacrifice of the æsthetic emotion, to which the aspect of a church should surely give rise.

The fact that, in the old days, illumination of a church was not aimed at, is shown in such a building as the cathedral at Chartres. Those who have visited that supremely beautiful church must recollect that on entering the western portal in the daytime it takes some minutes for the eye to become accustomed to the dimness, so that at first no detail of the interior can be discerned. This is owing to the fact that the many and vast windows are entirely filled with glass of the deepest and most gorgeous colours. It is obvious that the designers did not regard a church window as a means of illumination, but only as a part of a design conceived to promote the devotional sense.

Some old German churches still retain the old methods of lighting. At Quedlinburg, a church of the basilican type (that is to say, based, though a good deal developed, from the Roman basilica), the lighting is effected by only two candelabra of the small ring type, one in the nave and one in the sanctuary.

The ring candelabrum at Munster Cathedral in the sanctuary is of rather late fourteenth century type. This is perhaps not of very good design, but it illustrates the method of lighting. In this church, however, modern ideas seem to prevail, for there are modern gas standards and brackets in various places with abominable white opal glass shades.

The lighting of Lubeck Cathedral may be described as of the "haphazard" type. There are two candelabra of different sizes, of the kind known as Dutch spiders, i.e. one or more central spheres from which project many thin arms of S shape. In addition, there is a candelabrum of the "spire" or "fountain" type, a form which came into use when the Gothic style having the general lines mainly vertical had evolved from the semi-Classical or basilican form, in which the effect was horizontal. There is also a candle bracket projecting from the pulpit. We may notice in passing the beautiful wrought ironwork on the wood and iron screen which projects from the pulpit. The cresting is of delicate upright twigs of iron joined by a twisted cable, and the vertical bars between the wood pilasters of strands of iron twisted into a loose rope, and very decorative, but very simple.

In the church of St. Martin's, Brunswick, there is another example of the spider candelabrum. In this case it is one of three tiers.

The fine bronze candelabrum of the large ring type at the cathedral of Aix-la-Chapelle is evidently designed to form an intrinsic architectural feature, consonant with the lines and modified basilican form of the church. This example is of very early date—it is said to be of the time of Charlemagne, about the eighth century, and to have been the gift of the Emperor Barbarossa.

The gigantic "corona lucis" at Hildesheim Cathedral is a most interesting specimen of symbolic eleventh century work. It is twenty-two feet in diameter, and is intended to image the heavenly Jerusalem. The massive rim of copper gilt represents the walls of the city, and supports twelve turret lanterns. There were formerly, in the turrets and niches, figures of Old Testament worthies and the Apostles, and also figures representing the Graces and Virtues, but these were destroyed by the ultra-reformers in the sixteenth century.

There is a full-size model of this great work in the Victoria and Albert Museum. Another corona of the same type, but smaller, is in the choir of Hildesheim Cathedral. It should be noted that the church was originally an early basilica, but it has been faced with Renaissance work, so that the present architectural effect is out of harmony with the original corona.

Whilst on the subject of the principles of the lighting of churches I may say that the late Mr. Bentley, the architect of the Roman Catholic Cathedral at Westminster, asked me, before the building was finished, by what method I would propose to light it. It appeared to me that the appropriate method of lighting a church of the basilican type, such as that at Westminster, would be by vast coronæ

* A lecture delivered at Carpenters' Hall on March 15. Eighth the Series on "The Arts Connected with Building."

pendant, one from the centre of each of the saucer domes; in form and detail similar to, but possibly much more simple than those at Hildesheim and Aix-la-Chapelle.

I was interested to hear several years later a paper read by Mr. E. F. Reynolds, an architect who has made exhaustive researches in connection with the basilicas at Constantinople, in which he mentioned that it had been discovered that the ancient artificial lighting of the vast basilica of Santa Sophia at Byzantium, possibly in the days of its founder, Constantine the Great, in the third century, was by means of simple coronæ of varying sizes pendant from the dome; so I discovered that my scheme had been anticipated by many centuries. It is supposed that in the ancient lighting of Santa Sophia the lights were small glass lamps with floating wicks, grouped on circular chandeliers of twenty to two hundred lights each, the chandeliers being suspended from a series of concentric bronze rings suspended by chains from the dome. Single lamps are also suspended from the bronze rings, and some of the large lamps are enclosed in pierced metal balls, so that the light shines through the perforations.

Santa Sophia as at present has lights still arranged on somewhat similar principle, but without the series of bronze

ELECTROLIER, LIVERPOOL CATHEDRAL
(Designed by Mr. W. BAINBRIDGE REYNOLDS in conjunction
with Mr. G. GILBERT SCOTT.)

rings. The actual lamp fittings are comparatively modern. It takes a large staff of men quite an hour to light so many lamps. Even in the present arrangement with fewer lamps, there must be quite fifteen or twenty thousand separate lamps. I imagine that they are, of course, quite dim, similar to the light given by sanctuary lamps, such as *one* sees in churches in Europe. You may think that my view with regard to the correct way of lighting churches in isolated groups of lights was not that of the Byzantines, but you must recollect that their lighting demanded a more or less all-over scheme, because of the extreme dimness of their little oil lamps; whereas in the subsequent mediæval churches candles were in common use, and gave much more light than the small oil lamps of the Byzantine period. Furthermore, the Byzantine architecture being more Classical in tendency than the Romanesque basilicas or the mediæval churches had, in the interiors, less sense of mystery, and the emphasizing of the shadow in the architectural scheme (when artificially lighted) was not deemed to be of so much account or value as it became in those later styles of architecture.

For the lighting of churches I have in some cases suggested pendant electroliers in which are placed lamps in

front of reflectors, so that the light is in all cases reflected towards the east or altar end of the church, whilst the lamps themselves are concealed from the congregation. The lights would be ten or twelve feet above the floor. If it is desired to illuminate the vaulting or roof, which I personally think an utter mistake, subsidiary lights could be arranged above the reflectors concealed by the cresting. Such an arrangement lends itself to architectural treatment, and to decoration by colour and gilding. As an example of the lighting of a modern Gothic church I will take the Lady chapel of the new cathedral in Liverpool. Here it had been suggested that the nearest approach to the equal diffusion of light would be by a large number of single light pendants equally disposed over the entire area. From the purely practical point of view this system would no doubt have been perfect, but, as there would have been no shadows, the architecture of the building would have lost nearly the whole of its artistic interest. The electroliers which I eventually made are six in number, each having twelve 16 c.p. lamps, eight pendant from the cove in the base, and four in the canopy or tabernacle work in the centre of the design. They are tall in proportion to their width (i.e. spire or fountain like in form), to echo the feeling of verticality of the building itself. The basis of the design being square on plan, the tendency to restlessness, due to the rather ornate character of the minor features, is arrested. These electroliers, which are about nine feet in height, are of wrought iron, nearly entirely gilded with gold leaf, quiet in tone, a few of the parts painted with cobalt blue.

To sum up the problems connected with the lighting of churches, we may say first with regard to disposition that a too much diffused light destroys the effect of mystery, so much to be desired in a church, owing to the absence of shadows; and second, with regard to design, that in a basilican or Classical form, having mainly horizontal features, the suspended candelabra of the horizontal ring form, as at Hildesheim, Aix-la-Chapelle, and the ancient method of Santa Sophia, is the most appropriate and harmonious. In a building of the more mediæval type, i.e. the vertical Gothic type, the spire or fountain like form should be chosen, as at Liverpool Cathedral. If you imagine these types transposed you will at once feel the sense of incongruity.

For internal domestic lighting by electricity the problem is no doubt difficult, and it may perhaps be said that it has not been solved with complete satisfaction. One reason is that if the lamps are sufficiently high to prevent an unpleasant glare in the eyes, the illuminating power is seriously diminished. It may be shown scientifically that the illuminating power of lights varies inversely as the square of the distance. For example, a certain light, say two feet away from an object, will illuminate that object to a certain degree. If the light is removed to say six feet away from the object—i.e., three times as far—the degree of illumination will be diminished, not to one-third, but to one-ninth, and so on. Or to put it another way, an object is illuminated to a certain degree by one electric lamp at a distance of two feet. If it is desired to illuminate it to an equal degree by lamps three times as far away, then nine lamps must be used. From this it will be seen how extremely uneconomical it is to use remote lights. It has been sought to prevent the glare by concealing the lamps, and depending on reflection from a white ceiling or other surface for illumination. This method is also wasteful, and a room wholly lighted in this way has a somewhat cheerless appearance, perhaps not unlike that of moonlight. On the whole, it appears to me that lights reasonably near the ground, and covered with a translucent shade of restful tone are the most satisfactory.

[Mr. Reynolds here showed a number of slides illustrating modern fittings for domestic lighting made by himself—one of which appears in our centre plate. These were followed by slides of old and new lamp standards and brackets. Next came some symbolic ornaments for churches, two of which (a silver censer, incense boat and spoon, and the primal cross of the Archbishop of York, both designed and made by Mr. Bainbridge Reynolds) are included in our centre plate. The next group comprised gates, railings and staircases, that is to say examples of the principal uses of wrought-iron applied to decorative design.]

The railing at the Horse Guards is a simple work of the Georgian period which is massive and magnificent. The building is by the architect Kent. The gates are a specimen of double scroll panel gate with piers oblong on plan. It is massive to match the railing. The base, the dado, and the cap mouldings have very bold projections; they are of cast iron, the whole of the rest of the work being wrought. The beautiful "masculine" flavour of the design is admirably

suit to the charming severity of the detail of Kent's building, and in entire harmony and sympathy with it. In spite of their simplicity and breadth, they are somewhat "Regal" in aspect, but with "British" Regality, unlike the Regality of work at Versailles or Nancy which was intended to convey the impression of the Palace of an Emperor rather than that of a King.

The railing at Boodle's Club, St. James's Street, S.W., appears to me one of the most beautiful examples of Adam railing in London. Its severe simplicity is one of its most striking features.

I have always admired the gates of the Inner Temple. They prove that which I always contend, namely, that gates and railing, when placed in large spaces, or against vast trees in a park, demand that the iron, both of the framework and the scrollwork, should be generous in size. In this respect much of the modern work fails, I think. It was erected early in the reign of George II.

The seventeenth-century railing in Lincoln's Inn Fields, on the west side, is absolutely mediæval in character, and the only example of seventeenth century railing in London, put up before Tijou and Huntingdon Shaw, and men of that period. It is a perfectly satisfactory screen of a protective nature, which is easily seen through, and does not obstruct the view of the beautiful house behind it by Inigo Jones. All ironwork previous to Inigo Jones was mediæval in character, and the example proves that even, contemporary with Inigo Jones, architecture was still mediæval in style. It is excellent and very simple in design, and stands between the two well-known immense piers of red brick, surmounted by stone vases. The facade of Inigo Jones's house, seen behind the railing, is of exquisite proportion and quite simple in detail.

One of the most beautiful staircases in London is at Lincoln's Inn Fields. The panel at the head of the stairs has many of the features of the screen at Hampton Court.

Perhaps the finest example of an eighteenth century English staircase railing is at 5 Bloomsbury Square. This has been attributed, with insufficient evidence I think, to Isaac Ware, the architect of Chesterfield House in Mayfair.

The gates and railings at Carshalton Park, Surrey, are well-known to students of metalwork, owing to their unique character in design. They are very distinguished and uncommon looking, and have a certain air of weirdness, if not of sadness, which is rather fascinating. The strong note of horizontality marked by the dado and cornice, combined with a similar minor note in the three gate heads (of scrollwork), in conjunction with the strongly marked arresting point at the square piers at either end, give to the whole ensemble an air of great reposefulness and dignity. They were designed by Giacomo Leoni, born 1686 and died in 1746. They were erected at Carshalton about the year 1723. During recent years they were for sale.

Jean Tijou, the celebrated designer of ironwork in the days of Wren, designed the screens which lead into the north and south aisles of the choir of St. Paul's. Tijou's book of designs for ironwork proves that he was not a designer strictly from the smith's point of view. The designs are, so to say, mere patterns for ironwork. The smith, in executing the work from his design, probably made a rough, but practical, cartoon from it with a "coal," as they termed charcoal in those days. Tijou was, however, an expert designer in another respect, in that in designing his patterns of the scrolls and arabesques, he was careful to design the patterns left by the voids, as well as those of scrolls themselves, so as to make a pleasing combination. This point is one not very often observed in the designs of subsequent periods, and still less perhaps in modern ones. Tijou used forms such as squares, and other shapes more appropriate to materials such as wood or stone. These forms the smiths of previous times would not have dreamed of using, as they do not lend themselves readily to the natural manipulation with hammer and anvil of wrought iron. It is not impossible to make such forms in this material, and Tijou no doubt was content to use these forms, inappropriate to the material, with a view to perfection of design, in order to prevent a feeling of restlessness in the scrollwork, through contrast with these adjacent geometrical forms.

Before leaving the subject of old gates, railings, and screens, I would observe that a study of them shows that the English designers, from the reign of James II. to the end of the Georgian period, were evidently influenced by French feeling. I thought it well to give a fairly large number of examples of the charming old pieces of ironwork still existing in London, so that those who care to do so may go to see them themselves. They ought to be carefully photo-

graphed, drawn, and measured, as there is only too much reason, alas! to suppose that they will now rapidly disappear owing to "so called" improvements, and to rebuilding. A whole series of exquisite balconies (mostly of the geometric type), and many splendid examples of "Adam" type staircase and railings, have already gone from each side of Great George Street, Westminster, during the last two or three years, and one fears that they will not be replaced by anything so beautiful, so characteristic, or so appropriate.

In some respects the very finest metal work which has ever been produced in the history of the world is that of a particular epoch in the Renaissance period in Spain. The metal work, both in silver and gold, and in forged iron, was of the most superb description, both in design and execution, but it is in the latter metal that the Spaniards chiefly excelled, especially in their grilles, which they call Rejas. It is still said, by the bye, in Spain that a Spanish smith can, even now, make a good Reja, but this is, I fear, very doubtful. The finest of these are naturally to be found in the beautiful cathedrals of their charming country.

Most English people have at one time or other visited Westminster Abbey. I mention the Abbey because the arrangement of the choir there in reference to the other parts of the building is the same as it invariably is in a Spanish cathedral, that is to say, that the choir is in the nave, westward of the lantern, or place where the nave, sanctuary and transepts meet. In a Spanish cathedral one of these immensely tall Rejas or screens would be placed where the altar rails are at Westminster, so as to protect quite effectually the precious ornaments and vessels in the sanctuary. Another Reja would be placed at the eastern end of the choir, to guard the valuable books and painted illuminated missals in the choir. In some cases others of similar height are placed north and south of the lantern, to cut off the two transepts, where the lay worshippers were assembled, thus giving a free and uninterrupted passage from the choir to the sanctuary for the clergy.

In other cases, where the two grilles or Rejas cutting off the two transepts are omitted, low railings, about four feet in height, extend from the gates in the Reja at the eastern end of the choir to corresponding gates in the Reja guarding the sanctuary. These low railings are placed so as to be of the same width as the gangway or central aisle of the choir, and serve the purpose of preventing any pressure from crowding during the progress of the clergy from the choir to the sanctuary (especially during the great festivals of the Church).

The western end of the choir, which is in the nave, is separated from the nave, invariably, by a solid stone screen, with a door in the centre of it, precisely similar in type to the one at Westminster Abbey, and in the same position. A Reja (or metal grille) is never placed there in a Spanish church or cathedral.

The particular phase of the Renaissance in Spain on which I remarked just now is called by the Spaniards the Plateresque period (of which the Reja of St. Pablo, Palencia, is a fine example), and is that which gives a particular flavour of its own to the architecture (and especially to the Rejas) of that period. This period lasted roughly from the year 1500 to 1560, and most of these metal grilles were executed more or less during that period. The magnificent specimen of one to the high altar in Seville Cathedral, by Friar Francisco di Salamanca, was executed between the years 1518 and 1533.

There are, of course, all over Spain, wrought iron grilles of the previous Gothic type, such as that in the cloisters of Barcelona. These were usually decorated in colours and with parts gilded. The colours were usually Venetian red, sage green, and sometimes cobalt blue, in conjunction of course with subsidiary colours such as ivory white.

These Gothic Rejas are usually tinged with a strong flavour of Orientalism. One in Burgos Cathedral is almost wholly Oriental in conception and detail; but this characteristic is not to be wondered at, when we remember that the Moors were inhabiting a part of Spain for nearly 800 years. The Renaissance (or Plateresque) examples were not entirely uninfluenced by this phase in the history of the country, though this flavour is not nearly so noticeable as in the earlier Gothic examples. The fine example of a Spanish Renaissance Reja in the new ironwork gallery at the Victoria and Albert Museum (where it is much more effectually displayed than it formerly was in the old gallery) exhibits a strong note of Orientalism in the delicate and lace-like trefoils between the caps of the spindles under the cornice.

The lecture closed with a fine series of slides of Spanish ecclesiastical metal work.

THE ARCHITECTURAL ASSOCIATION.

AN ordinary general meeting was held at 18 Tufton Street, Westminster, on Monday last, of the Architectural Association, combined with a meeting of the Camera, Sketch, and Debate Club. The chair was taken by Mr. Gerald C. Horsley, vice-president. The election of the following candidates for membership was unanimously carried:—Messrs. C. O. Beardmore (Oxford), A. A. Messer (Woking), and F. M. Tozer (Maidenhead).

The house list for session 1911-12 was announced as follows:—

President:—Mr. Gerald C. Horsley.

Vice-Presidents:—Mr. W. Curtis Green, Mr. W. J. Tapper.

Ordinary Members of Council:—Mr. A. T. Bolton, Mr. C. C. Brewer, Mr. F. C. Eden, Mr. G. Leonard Elkington, Mr. Horace Field, Mr. Stanley Hamp, Mr. A. R. Jemmett, Mr. A. Foxley, Mr. P. W. Lovell, Mr. C. Lucas, Mr. E. B. Maufe, Mr. Percy May, Mr. C. Wontner Smith, Sir A. Brumwell Thomas, Mr. G. C. Wornum. (Ten to be elected.)

Hon. Treasurer:—Mr. Arthur Keen.

Hon. Editor "A.A. Journal":—Mr. P. Cart de Lafontaine.

Hon. Librarian:—Mr. W. H. Ward.

Hon. Secretary:—Mr. Herbert A. Hall.

Nominations for officers or ordinary members of the Council may be made by members at the next ordinary general meeting on April 3, in accordance with By-law 33.

Mr. A. M. BRICE then read the following paper, entitled—

The Legal Authority of the Architect as an Agent.

It is obvious that, in dealing with a subject so large as the title of this paper indicates, I must confine myself rather to principles than details, to illustrations rather than to arguments; and it seems to me that it may be more suggestive if I dwell upon the cases where the authority of the architect is implied, rather than upon those in which it is expressed, for the careful architect will find expressed in the building contract from which he derives his authority as agent precise directions as to the nature of that authority, while it may be only by the aid of a long experience or a legal knowledge that he will be able to decide for himself the range and limitation of his implied authority.

Speaking generally, an architect may be employed merely as an adviser, or as a designer or draughtsman, or as an agent for the building owner. Usually, of course, he is called upon to discharge all these functions together.

As adviser, he holds himself out as possessing the necessary knowledge and skill, and as willing to exercise all reasonable care in giving such advice. No authority is delegated to him by the building owner, because there is none to exercise in this simple relation.

As designer or draughtsman, he contracts to supply drawings and a specification executed with reasonable care and skill, and that these shall be capable of being carried out. He warrants no special degree of skill, and the test as to whether he displays enough is whether the skill is so deficient or the case so defective that a bad result becomes inevitable. Again, no authority is delegated to him by the building owner, because there is none to exercise in this relation.

But when he adds to these the functions of supervisor of the works upon which he has advised, or which he has planned, or, less often, when he undertakes to supervise the erection of what others have planned, he becomes the agent of the building owner, invested with certain authority over others, and expressly liable to his employer and to third parties for his use of it. He is invested with authority to deal with many questions regarding both site and building, the preparation of the plans, the working drawings and specification, the estimate of the cost of their execution, the obtaining of tenders, the preparation of the building contract, the performance of the duties imposed by the contract and the agreed variations from it, and the general supervision and control of the performance of the contract by the principal contractor and his sub-contractors.

An architect may be appointed and invested with the full authority of the terms of his appointment by mere word of mouth, or his appointment may be inferred from the conduct of his apparent principal, or from the ordinary course of dealing, or, as is obvious, it may be shown by a written contract. In practice appointment by written contract is the usual manner, but in law it is only necessary in two cases to make such appointment in writing. In the first case, if

the work is not to be performed within the year, or is incapable of being completely performed within the year, then, in order to satisfy the Statute of Frauds, the appointment must be in writing. In the second case, seeing that a corporation aggregate can in general only act by deed, its agent must be appointed by deed. There are exceptions to this second rule, and for certain trifling agencies a corporation can act without deed, while a trading company, though it be a corporation aggregate, can generally act without a deed.

The authority of an architect flows from the terms of his appointment as the agent of his employer, and in practice is generally limited (so far, at least, as the relations between the building owner and the builder are concerned) by the terms of the building contract. On the other hand, it frequently happens that where the work is on a small scale, or of an intermittent character, the building owner does not enter into a formal agreement expressing the conditions upon which he delegates his own authority to the architect, and in such cases the limits of that authority must be sought elsewhere than in a formal contract. It follows that where no formal agreement exists defining the power of the architect that the general principles of the law of agency, limited by the application of the ordinary practice of the profession, will control the authority of the architect.

The general principles of the law of agency as affecting the authority of the architect are equally applicable whether the appointment is made in writing or otherwise, but in both cases they may be excluded by an express, or what in point of law may be held to amount to an express, provision to the contrary. Failing such express provision, it is clear that the architect's authority (as between his employer and third parties) is to be measured by the extent of his usual employment—a standard which, though it might be readily ascertained in practice, is not unlikely to invite litigation.

Where the architect is the agent of his employer, authorised to act in the name of that employer, he may be the general agent of his employer, or his authority may be restricted within narrower limits. If he be the general agent to the extent of the usual employment of an architect, then he possesses the full apparent authority due to his position, and his employer is bound by all acts of the architect which come within that authority. And whether the terms of the agreement are merely general, or are in part or wholly inconclusive as to the nature of the authority imposed, the architect would be justified in adopting the ordinary and reasonable practice of his profession, and in doing so would be held to be complying with the requirements of the law.

On the other hand, where the authority of the architect is defined by express terms, which may be oral, but are usually in writing, such limitation must be strictly observed. Any infringement of such authority by the architect would release the employer from liability, and render the architect himself liable in damages to injured parties. But the infringement must be material, for the law holds that in the construction of such authority there is present an implied permission to the agent to use the means that are necessary to carry into effect the expressed purpose of the employer.

Thus, in *Evans on "Principal and Agent"* (second edition, p. 178) it is pointed out that when authority is conferred upon an agent by a formal instrument there are two rules of construction to be carefully observed:—

(1) The meaning of general words in the instrument will be restricted by the context and construed accordingly.

(2) The authority will be construed strictly so as to exclude the exercise of any power which is not warranted either by actual terms used, or as a necessary means of exercising the authority with effect.

A good illustration of this doctrine is afforded by the leading case of *Sharpe v. San Paulo Railway* (1873, L. R. 8 Ch. 597), where it was held, *inter alia*, that the contractors could not, on mere verbal promises by the company's engineer (which were unauthorised), maintain against the company a claim to be paid sums beyond the sums specified in the contract, even though the amount of work to be executed might have been underestimated by the company's engineer; and that as the contract had provided that the certificate of the engineer had been made a condition precedent to payment, such certificate must be held conclusive between the parties in the absence of fraud.

The authority of the architect, whether general or limited, usually extends to his doing all acts required in the process of obtaining tenders and making drawings for and supervising the erection of or addition to the building, for the purpose of which he has been employed. Thus, in *Kimberley v. Dick* (1871, L. R. 13 Eq. 1), Lord Romilly, M.R., said

that he must treat the architect as the agent of his employer, "generally, for all purposes connected with this building, and that without any limitation as to price or anything else." Again, Lord Coleridge pointed out in *Laidlaw v. Hastings Pier Company* (Jenkins and Raymond, fourth edition, p. 238) that the engineer, from the beginning to the end of the deed, "out of the four corners of which his position is to be collected," was agent to his employers, but as their agent "clothed with peculiar functions exercisable only as provided for by the deed." Where, consequently, an architect allowed the projecting timbers of the adjoining owner to be built into the wall of his employer, it was held that he had exceeded the nature of his employment, and that the act was not within his authority (*Betts v. Pickfords* (1906), 75 L. J. Ch. 483).

Again, if an architect be employed merely to make drawings, he is acting as an independent contractor, a skilled draughtsman, or professional man, and, as no question of agency arises, no question of authority can follow. But if he is making drawings for delivery to the builder, a question of authority can enter as to the warranty that they are correct or that the builder can work to them. But no such warranty can be implied. An illustration of this is to be found in *Thorh v. London Corporation* (1876, 1 App. Cas. 120), where the House of Lords held that where plans and a specification for the execution of a certain work are prepared for the use of those who are asked to tender for its execution, the person asking for the tenders does not enter into any implied warranty that the work can be successfully executed according to such plans and specification. No such warranty would appear in any properly drafted building contract, and if the architect should be so foolish as to warrant such accuracy or possibility to the builder it is he and not the building owner who would be liable to a builder, for it is the architect who has exceeded his express authority.

Where the duty and authority of the architect are set out in a written contract there should, as a rule, be little difficulty in ascertaining the extent and limitation of both duty and authority. But all building contracts (in which the provisions for the architect's powers are usually embedded) are not perfect specimens of draughtsmanship, and it is when they become ambiguous, inconclusive, or defective that questions for consideration and settlement arise. It is in such cases that it becomes of the highest importance to know what the implied as opposed to the express authority of the architect may be, and to apply to the omissions or the ambiguities the general principles of the law of agency as modified by the practice of the profession, and as limited by the context of the contract in question.

For example, when the architect has power to order extras he has not, in consequence, the implied authority to order as extras the execution of omissions on his drawings (*Sharpe v. San Paulo Railway*, supra). Nor when his drawings are not practicable has he any implied authority to order as extras work to be done that will render them practicable. Thus, in *Tharsis Sulphur and Copper Company v. McElroy & Sons and others* (1878, 3 App. Cas., part 2, p. 1040), where there was a contract for construction for a lump sum, and a clause that no extras should be done without a written order from the employers' engineer, it was held that the certificates of the engineer, though they referred to work done of a more expensive character than that specified for, were not to be regarded as written orders, and that the claim of the contractors was excluded by the contract.

No implied authority rests with the architect either to obtain tenders or to enter into contracts with a builder. Neither is he authorised to negotiate for advances or undertake any preliminary work of this character without an express authority from the owner. If, on the other hand, he has such express authority, he can bind the owner for any reasonable expenses to which he may have been put in the course of conducting such preliminary work.

Though an architect has authority to make drawings for the purpose of the works, he has no implied authority to make such changes in those drawings as would destroy the original scheme. But he has an implied authority to supply drawings of details not shown in the original plans.

So, too, it has been held that an architect has, when authorised to obtain tenders, an implied authority to engage the services of a quantity surveyor to supply quantities, although it is doubtful whether such architect has any implied authority to take out those quantities himself. But the quantities must comply with the limitations of the architect's authority, and if he be authorised only to

obtain tenders not exceeding a certain amount, then he can only have the implied authority to obtain quantities within that amount. But where, as in *Evans v. Carte* (*Times*, May 5, 1881), the quantity surveyor brought an action against the building owner for fees for reducing the quantities upon drawings of the architect, which proved too expensive when the tenders came in, and the building owner authorised the architect to reduce the quantities in order to reduce the cost of the building, it was held that the quantity surveyors were entitled to sue the building owner for the cost of such reduction of quantities. And even if the building owner has not originally given the architect authority to reduce the estimates and quantities, but becomes aware of the fact and approves expressly or impliedly, the architect's authority would be confirmed, for, as Lord Coleridge said in the case just cited, "ratification or tacit assent would be equivalent to precedent authority."

In the absence of a limit of price in the contract, the architect has an implied authority to order works for which the builder may recover the price, even though, as a fact, the employer has privately given such limit of price to the architect. As long as the authority can be properly implied, the builder can maintain his claim against the building owner, and it is for the latter to recover damages from the architect for exceeding his authority.

The architect has not an implied authority to dismiss a builder, and consequently any authority to so dismiss must be expressed, and is usually put into the contract. If put into the contract, it must be specific and not general in its application, for it has been held that where there is a clause enabling the architect, should he deem proper, with the written authority of the building owner, to dismiss the builder, the written authority of the building owner must not be in general terms, but must indicate a particular person.

An architect has no implied authority to bind his employer for the expense consequent upon sub-contractors of the contractor carrying out the orders of the architect, whether by way of original work or of deviations. Nor has he an implied authority to incur on behalf of his employer any liability to specialists unless such specialists can be shown by the terms of the contract to be employed by the building owner. If such specialists are, in fact, the sub-contractors of the principal contractor, then no certificate of the architect can entitle them to claim payment from the building owner; nor can the contractor claim damages from the building owner in respect of any delay caused by such specialists (*Leslie v. Metropolitan Asylums Board* (1901), 68 J. P. 86).

The architect has no implied authority to vary the building contract. His authority, on the contrary, directs him to see that its express terms are carried out. But it is always possible for the parties to the contract to vary it by consent, and to empower the architect to authorise such variations. Where he is empowered to give directions, such directions must be within the expressed limits of the contract (*Sharpe v. San Paulo Railway*, supra).

Similarly, an architect has not the power, unless expressly given, to represent that the building owner has varied certain conditions—often such conditions as deal with waiver. The contract, when reduced to writing, remains the final agreement of the contracting parties, and no unauthorised representation of the architect can reduce the liability of the builder or impose one on the building owner. On the other hand, should the architect make representations, before the builder has entered into the contract, as to the character of the work he will require, he would be authorised to act subsequently upon such representations, and they would not be held to be varying the terms of the contract unless those terms were inconsistent with the representations. But the making of such representations is loose and ill-advised and leans to litigation.

An architect has no implied authority to give verbal orders when the contract provides for orders in writing, nor can he dispense with estimates in writing when such are required. But this does not prevent the architect from giving verbal orders or receiving verbal estimates conditionally upon their being reduced into writing before they are to become binding.

As to extras, the architect has no implied authority to vary the conditions which the terms of the contract impose in respect of these items. Nor has he authority to regard as extras such items as are absolutely necessary to complete the contract. The architect will often certify as extras certain works which are not shown on his drawings or mentioned in the specification, or, at least, in the quantities. He has no authority to do so if such details, though not

included in the contract by name, are necessarily part of the work. It is the duty of the builder to see whether everything is mentioned in the specification necessary to the completion of a given work, and to allow for such things as may not be described in the specification or shown on the drawings. *Thorn v. London Corporation (supra)* clearly laid down that the onus rests on the builder if he tenders on specifications and drawings which are inadequate or not practicable. He must not rely on such drawings or specifications; as Lord Chelmsford said, in the case just cited, "It is an usage of blind confidence of the most unreasonable description." This being so, it is not within the limits of the architect's authority to certify for such extra work which such "blind confidence" might consider extras to the contract. Whether certain work is an extra or is included in the contract may be a question of construction, and demand legal consideration, but it is often within the implied authority of the architect to decide what are extras. Such a power would arise when the contract allows him to decide the construction of the contract; it would also be present if he were empowered to value extras, and were not required to demand or were permitted to waive written orders for extras. This would apply to extras within the contract. But if the extras were so outside the contract that they might be regarded as severed from it, and from any restriction contained in it, it would naturally follow that all the conditions affecting written orders, valuations, and certificates by the architect would thereupon cease to apply, and that the claim by the builder in respect of such extras as these would be found on the basis of a *quantum meruit*, and not upon the contract as controlled by the authority of the architect, whether express or implied.

To put it summarily, an architect has no implied authority to order or contract for extras, and if he abuses his powers in this respect under the contract the builder, who is privy to the contract and yet acts on these unauthorised orders, cannot recover from the building owner (see *Cooper v. Langdon* (1841), 9 M. and W. 60).

Similarly, there is no implied authority on the part of the architect to bind the building owner by his progress certificates, unless such certificates conform to the terms of the contract. But if the architect is authorised by the terms of the contract to make a valuation which shall be binding upon both parties to the contract, then he would have an implied authority to issue certificates not so conforming.

The authority of the architect when granting a certificate in his capacity as the agent of the building owner is comprised within the range of such certificates as may be merely ministerial—that is, which do not call upon him for a final opinion dependent on the exercise of judgment and professional skill. In certifying that certain materials have been supplied, that a given amount of work has been done, that something agreed to be delivered has been delivered, that something which the architect had power under the contract to order has been ordered by him and supplied, that the times agreed upon for performance have been complied with—in short, while issuing non-conclusive, interim or "progress" certificates—the architect is ordinarily discharging the ministerial duty which he is authorised as agent for the building owner (see *Tindal, C.J., in Morgan v. Birnie* (1833), 9 Bing. 672), and so long as he exercises all proper care, displays all reasonable skill, and acts honestly and *bonâ fide*, and within the scope of the authority conferred on him by the contract or otherwise, he discharges his liability to the building owner. Acting in such a manner, he is under no liability to the builder, between whom and him there is no privity of contract. But as soon as his authority is extended to enable him to determine, or assess finally and conclusively, some question of fact between the parties, he ceases to be the agent of the building owner *ad hoc*, and becomes a quasi-arbitrator between the two parties. His authority extends to, nay, it compels an impartial discharge of this supplementary power, for, as *Collins, M.R.,* observed in *Chambers v. Goldthorpe* (1901, 1 Q. B. 641), he is "clothed with the duty of exercising an impartial judgment." All that is needed to make such judgment binding are the facts that he is not disqualified by some circumstance to act judicially, that he is the person designated by the contract to give the certificate (when the certificate of more than one architect is required a certificate by one will not suffice, see *Lamprell v. Billericay Union* (1849), 3 Ex. 282, 18 L. T., Ex. 282), that he has received authority to certify regarding the subject matter of his certificate, that the power is still in existence, and that the certificate is shown by the contract to be intended to be binding on both parties (*Robins v. Goddard* (1905), 1 K. B. D. 294).

So, too, a contract will frequently leave many matters to the decision of the architect for the exercise of his professional judgment and skill, not as an arbitrator, who hears and weighs evidence, but as a person on whose special knowledge and capacity both parties rely. In such a case, the authority exercised in individual instances is an implied authority, which depends for its validity upon the fact that it is applied to cases which come within the clause of the contract. For example, where in *Roberts v. Bury Commissioners* (1871, L. R., 5 C. P. 310) the architect had decided that the builder had not exercised due diligence, and the building owner, in consequence, dismissed the builder and determined the contract under the conditions, it was held that the building owner was not entitled to do so, as the contract had not made the architect conclusive judge as to due diligence. And where the architect's certificate or decision is declared to be conclusive concerning anything in connection with the contract, there is yet no implied authority by which the architect can bind the builder as to the compensation payable by the building owner in respect of his breach of the contract.

Such are a few of the many instances which might be cited as showing where the architect has an implied authority and where he has not. Only an acquaintance with the principles of agency, as limited by the practice of the profession, and of the case law of the subject, will enable a clear view to be taken of the bearings of each question as it arises, but the architect can generally pursue his path in peace and safety if he study his contract with care, and adhere to it with scrupulous fidelity. If, however, he does not, he will be faced with the unpleasant consequences which follow upon his exceeding his authority—consequences involving not only his employer, but also himself in serious loss.

(To be concluded.)

NOTTINGHAM ARCHITECTURAL SOCIETY.

THE fifth meeting of the Designing Club connected with this Society was held on March 14, the president (Mr. R. Evans, jun.) in the chair. There was a very good attendance. The subject set was a "Design for an Urban District Council Office," and the visitor was Mr. F. W. Gregory. Although only four sets had been submitted, they all showed that a careful consideration had been given to the subject, and Mr. Gregory remarked that he noticed a great improvement in the general style of drawing since his last visit. After pointing out the various good points and calling attention to the defects, a discussion followed in which several present took part. On the proposition of Mr. Sutton, vice-president, a hearty vote of thanks was accorded Mr. Gregory for his kindly criticisms and the four students who had been at the trouble to prepare drawings to be "shot at." The president announced that a Smoking Concert had been arranged for March 28, when the whole of the designs sent in during the session would be exhibited as well as the drawings submitted in the measured drawings competition, and the prizes would be presented.

ILLUSTRATIONS.

METAL WORK.

THE screen in the parish church of St. Neots (of which a detail photograph is given) is of gilt wrought-iron. The screen was made by Mr. W. Bainbridge Reynolds from the designs of Mr. F. A. Walters, F.S.A. The censer, incense boat and spoon, grouped together in another photograph, are of silver, and were made and designed by Mr. Bainbridge Reynolds. Two years ago Mr. Bainbridge Reynolds was invited to design and make the Primatial Cross of the Archbishop of York. A photograph of it appears in the centre of our plate. The lantern illustrated was designed for the lighting of a long gallery of Elizabethan type in a country house. This fitting is one of several which were decorated in colours and partly gilded in the customary manner for work of the Elizabethan period. The interior of Lubeck Cathedral shows metal work referred to by Mr. Reynolds in his lecture. The repoussé copper retable from the Escorial and the silver monstrance from Cadiz are described in Mr. Reynolds's lecture.

OXFORD COLLEGE SERIES.—CHRIST CHURCH.

WE this week complete our series of views of Christ Church with views of the Great Quad and of the interior of the Hall.

THE ILLUMINATION OF INTERIORS.

By Professor J. T. MORRIS, M.I.E.E.

PART II.

(Concluded.)

POSITION OF SOURCES OF LIGHT AND SUITABLE SHADES.

[T is an interesting problem, whether, for interior illumination, it is preferable to have a good local illumination where it is required for reading and writing, and to

Holophane Reflector Bowl.

Holophane.

allow the general illumination more or less to look after itself, or whether a sufficient general illumination should

be provided for all purposes. At one time the author held the former view, but more recently he has inclined towards the idea that a combination of the two is the

Holophane

most desirable. For street lighting he has for a long time, in opposition to general practice, insisted that shades should be provided so that no horizontal rays might strike

the eye when looking down the street. It would seem, however, that people prefer to see the effect of a number of bright points rather than have a good illumination only on the ground. As an example one might take the case of Whitehall; the high-pressure gas lighting in this street is magnificent from the point of view of brilliancy, but certainly defective according to the view expressed above.

For an efficient and scientific shade it is necessary that while the light shall be deflected in the required direction, there shall be as little loss as possible due to absorption.

One example of such a series of shades or globes is that manufactured by the Holophane Company. Figs. 12 to 14 illustrate the remarkable extent to which the

FIG. 16.

polar curves of illumination intensity can be varied by these shades to give the results required.

The principle of their action is illustrated in figs. 15 and 16. Fig. 15 shows the details of a globe in vertical section required to deflect the light downwards. It will be seen that the surface of the globe is serrated in the

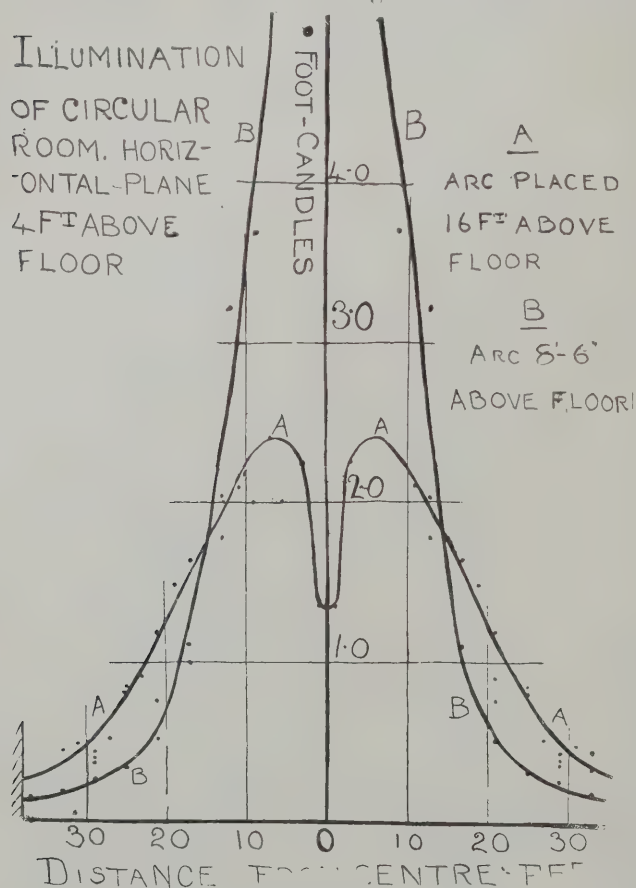

FIG. 17.

form of prisms, which, by refraction and total internal reflection, direct the rays as required. These surfaces are not made haphazard, but are designed on scientific principles. (It should be noted that as the illumination is required in a downward direction the exterior surface through which the light has to pass will not allow dust

to lodge.) Fig. 16 shows the action of a globe intended to distribute the light in all directions in a horizontal plane. In this case the section is horizontal. Apparently Mr. TROTTER was one of the earliest workers in this field who appreciated the great advantage to be obtained from a suitably designed globe. M. BLONDEL has also devoted much time to this subject, and such shades as those which have been described have been developed largely on the lines indicated by these two experimenters.

There is a common idea that when a room is lighted by a central source of light which is placed high up in the room, if the lamp be lowered the general illumination and also its usefulness will be improved. This is not so. It is true that there will be a space under the lamp which will have a brighter illumination, but nearer the walls the illumination on a horizontal surface will be diminished and, owing to the much greater inequalities brought about by the lowering of the light, will be decidedly less useful than before. As an example of this, let us take the case illustrated by the curves shown in fig. 17. The room was circular and of thirty-eight feet radius, and was lighted by a central arc lamp. The curve A-A shows the distribution of light on a horizontal plane 4 feet above the floor with the lamp in its highest position, while the curve B-B shows the change brought about by lowering the lamp 7 feet 6 inches, the original height being about 16 feet. It will be seen that while the illumination directly beneath the lamp was greatly increased, even to an undesirable extent, yet at places some distance away the light was actually diminished.

In conclusion, the subject of illumination has many aspects, though here it has only been possible to refer to a few of them. To the architect, however, suitable illumination is of great importance, as it may serve either to mar or greatly to enhance the lines of his interiors. He has many things to consider in the design of a building but surely the least of these is not the proper lighting of the interior either by day- or artificial light.

ROYAL INSTITUTE OF BRITISH ARCHITECTS

A MEETING of the Royal Institute was held on March 13, when a paper was read by Mr. J. A. Gotch, F.S.A., on "The Burlington-Devonshire Collection of Drawings," in the library of the Institute. A report of this interesting paper was given in our last week's issue. We give below a report of the discussion.

Mr. J. D. CRACE said it was a great pleasure for him to propose a vote of thanks to Mr. Gotch for the charming paper they had just heard; he would also like to add his personal thanks for the kind way in which Mr. Gotch had recognised the small part he had played in obtaining the transfer of the Burlington-Devonshire collection of drawings to the Institute. It had always been an incident in his life, said Mr. Crace, upon which he looked back with unmitigated satisfaction, because he felt that the premises of the Royal Institute of British Architects was a place where it could be turned to best account. The paper threw a great deal of light upon the history of British architecture as well as upon the history of the drawings themselves. The date of the Queen's House at Greenwich was beyond question, because it is inscribed on the front of the building. There seemed to be no doubt that John Webb deserves a higher place in the ranks of English architects than he now enjoys. The fact that the King Charles block at Greenwich Palace was attributed to Inigo Jones instead of to Webb was paralleled by the way in which most of the jokes in the first part of the nineteenth century were attributed to Sydney Smith, or the pictures imported into this country used to be given the names of one or other of the great masters. There was a natural tendency to select the best known name as author. Inigo Jones's reputation did not require to be bolstered up by any doubtful building. It was a surprise to him personally, added Mr. Crace, to hear that there were any foundations still existing of that ancient palace near the river which had occupied the site roughly of Queen Anne's block. There used to be a tradition that this palace of Henry VIII. extended eastwards at least as far as the present east gate of the hospital. The Institute were to be congratulated, said Mr. Crace in conclusion, on having a succession of architects who were willing and able

to give the time and care necessary to arrange a collection of drawings which must continue to attract the attention of those who followed the history of Italian architecture in this country.

Mr. LAWRENCE WEAVER said he would like to comment on one or two points in the paper which had struck him. Importance had been attached to the fact of the handwriting of Webb appearing on the drawing of the remarkable ceiling at Wilton. The presence of his lettering hardly proved that it was Webb and not Jones who made the design. If it did so then all present-day architects should be careful not to allow their assistants to put any lettering on a drawing. He would suggest that if search were made among the domestic papers of the period reference would almost certainly be found to Webb's precise work at Greenwich Palace. It seemed hardly fair to argue that the onus of proof of authorship lay on Inigo Jones, for surely some value must be attached to oral tradition. Neither should too much importance be attached to the quality of the work of Jones as shown by the drawings. For instance, anyone looking at contemporary prints would not place much value on his St. Paul's, Covent Garden. Similarly it was difficult to credit that people would have talked so much about Jones's west front to Old St Paul's Cathedral unless there had been something in the design.

Mr. W. RYLAND ADKINS, M.P., thought that certain conclusions arrived at by Mr. Gotch had some support from a study of the general view of history and of national development in the period referred to. At any rate it would strike one as plausible that anyone living in the time that Inigo Jones lived, and flourishing as he flourished, called upon to make designs for things like masques, scenery, and drapery would find greater delight in the use of his pen and pencil in freehand drawing than of the more strictly scientific instruments of tee-square and compasses. The seventeenth century in England was remarkable from one point of view for the breaking up of the old varied genius of the Elizabethan era and for the creation of specialists in all departments. There were grounds for contending that the same thing occurred in the realm of every art. People became more consummate masters in particular arts and sciences, but they lost their versatility. Inigo Jones, it should be remembered, was a man of varied calling. The man who designed the Queen's House at Greenwich did not afterwards design King Charles's block. The former was finished in 1635. From 1632 to 1641 Charles was very hard put to it to find money for his undertakings. When he had the Queen's House built he no doubt felt he had done everything he could, and no further plans would therefore be asked for. Moreover, it was difficult for students to-day to take too much into consideration the fact that at the end of the Commonwealth and in the reign of William and Anne the people paid an extraordinary reverence to everything dating before the Civil War. It became fashionable to adopt the attitude of looking back and worshipping everything done before the catastrophe. In consequence there arose a tendency to attribute everything and anything good to that time. Hence there would be a desire to attribute Webb's work to Inigo Jones.

Mr. J. P. MAINE (Librarian at Chatsworth) said that on behalf of the Duke of Devonshire he would like to support the vote of thanks to Mr. Gotch. He could not help feeling that if the Duke had been present he would (to use a Hibernianism) have still more regretted having been absent. There could be no doubt in anyone's mind who looked carefully at the drawings by Inigo Jones that he was infinitely more at home when drawing freehand than when trammelled with instruments. His sketch-book preserved at Chatsworth gives the idea of great mastery and power. This book was the one used by Inigo Jones on the journey to Italy before 1620, and in it he noted down any pictures or portions of pictures as they struck him in going round the galleries. They are masterly little sketches. When one looks at the original drawings for the masques one finds that the technical method is quite different, and that there is not nearly the same mastery. The figures were first outlined in pencil and finally put in with ink after many corrections and erasures. It seemed to him, said Mr. Maine, as if there were, at least, two hands at work on them. Undoubtedly a great deal of this second hand's work may, in the light of Mr. Gotch's paper, be attributed to Webb. With regard to the drawing for the ceiling of Wilton House was it not possible that an examination of the various inks used in the writing and drawing might furnish some additional evidence as to authorship?

Mr. C. R. PEERS said a very interesting distinction had

been drawn between the work of Inigo Jones and Webb. In considering the history of Inigo Jones it was rather illuminating to remember that as far as we know, and the evidence on the point was very clear, he was only a mere ardent amateur until he reached the age of forty-two. It was almost impossible to regard him as anything else. Previous to his return from Italy his architectural work was connected with the designing of scenery for masques, and those drawings can hardly be called architectural. It happened that he lived at one of the most critical times for English architecture, for the art had broken some seventy or eighty years before with the old vernacular tradition, and in the interval had been seeking for something else to rest on. The influences at first were Italian; then these appear to have left us, and our architecture became largely "made in Germany." What was wanted, and what Inigo Jones supplied, was sound scholarship. It can scarcely be claimed that what he gave the country was a vernacular style; but at any rate he gave order in place of confusion. Anyone who will compare the work going on before 1618 with the Banqueting House will see that the latter is absolutely different from anything in the country of that date. There was here a basis of sound and scholarly architecture which must have been an entirely new inspiration for the time. Webb appears to have been an English architect, strongly influenced by the wonderful scholastic teaching of Inigo Jones, but whose work was not on the same level at all. Longthorpe Hall is extremely different to the scholarly work of Inigo Jones, though a decided advance on the work of fifty or sixty years earlier. If one begins to attack or criticise the reputation of any famous architect it is difficult to know where to stop. It is only necessary in this connection to think of the number of houses attributed to Wren or of the pieces of carving said to be by Gibbons. Some of them may have been done by men competent to follow a lead. The great roof of Hampton Court, for instance, is entirely Italian in feeling, but the names of the carvers are quite English. So in the same way Wren and Inigo Jones taught other men, and founded a school of work of which they themselves did not produce one-third.

Mr. GERALD C. HORSLEY thought the Burlington-Devonshire drawings appeared to teach a great deal, not only from the point of view of history, but also from that of design and draughtsmanship. The power of freehand drawing which Inigo Jones possessed enabled him to indicate the true proportions of the work he was designing in a way which led to the final success of the work in the actual building. The more nearly our drawings approximate in delicacy, expressiveness, and refinement to those of the Burlington-Devonshire collection the better will our detail be.

Mr. MAURICE B. ADAMS remarked that architects had sometimes said after looking at a collection of old drawings that if one of their clerks turned out such work they would conclude he had mistaken his vocation. But in saying this they failed to detect the technical qualities altogether. The object of these artists was to represent what was passing in their minds at the time—they lost sight of every other consideration. The draughtsmanship of to-day was often entirely divorced from such principles.

The discussion was closed by Mr. Leonard Stokes proposing a vote of thanks to Mr. Gotch. This was carried by acclamation.

Mr. J. A. GOTCH, in replying to the points raised, said that early tradition was, of course, very powerful, and it was inevitable that a man who achieved a great reputation should absorb more than he really deserved. But Inigo Jones could spare some of his. It had been asserted by a previous speaker that Whitehall at any rate had nothing to do with Webb. As a matter of fact, at least nine of the drawings of the scheme at Worcester College, Oxford, were by him. The Banqueting Hall is supposed to be the only part of a large design which was carried out. But it is worth considering whether the Banqueting Hall was not built first, and the large design was tacked on to it later. The new west front for St. Paul's was certainly very much as shown on the drawing, except for the portico.

Mr. J. OLDRID SCOTT, F.S.A., architect, has prepared a report on the condition of the tower at All Saints Church, Hereford. An immediate restoration is recommended at a cost of about 3000l. The tower was commenced in the thirteenth century and completed in the fourteenth.

THE PAINT AND VARNISH SOCIETY. STANDARDS OF COLOUR.

(Concluded.)

MR. R. CLAUDE BUSSELL expressed his approval of the suggestions, and said that in considering the subject it might be interesting to remember the standardisation of weights and measures. At first the foot was an arbitrary measurement, and perhaps if an arbitrary shade was taken for a colour, such as royal blue, it might also in time become standardised. Many years' experience had shown him what an extraordinarily difficult thing it was to get a satisfactory colour card. For instance, if a paint was made to match the coloured tab it did not in bulk look a bit like the tab. This explained why architects used the expression "approved tint." No one could predict with certainty what any particular colour would look like *in situ*, the effect produced being greatly dependent on mass and surroundings. (Mr. Bussell exhibited two splashes of paint taken from the same pot, and showed that when the background was changed they had not the slightest resemblance to each other.) Even with the most excellent colour card it did not in the least follow that a man was going to get a colour which, when used, had the appearance of the tint upon the card. The alphabet had only 26 letters, but a great number of ideas could be expressed with it, and he thought if some 50 colours were standardised as a beginning a great deal could be done, as in his experience the whole range of everyday painters' colours were comprised in about that number. He suggested the appointment of a committee to debate the question, and report to the Society. The difficulties that would confront the committee would be those of differentiating such colours as ivory and cream, pink and rose, slate and grey, &c., and also what colour to assign to old gold and such colours. It would also be a hard task to decide what colour invisible green was; and as for nut brown, a man might use an almond, a filbert, or a cocoanut. He thought it would be necessary to start from an arbitrary standard, as in the case of weights and measures, and leave it to this or succeeding generations to improve upon.

Mr. T. A. DAVIDSON thought there was no doubt as to the desirability of standardisation, because it was so much more easy to work to a definite standard than to an indefinite one. But he considered that in the practical carrying out of such a scheme difficulties would crop up. Those difficulties, however, might be met by the standardising of conditions. In preparing the colours the question arose as to what medium the colours were to be mixed with. If made up as a paint with linseed oil as a medium the colour would alter; if kept in a dark place the colour would darken; so that the idea of protecting the colours from change by keeping them in the dark was really a condition that might facilitate change. He did not think the difficulties were insuperable, owing to the fact that the tintometer might enable the various standards to be measured in such a way that they could be made up again at stated periods. Suppose a book was issued containing colour standards, those standards might be reasonably constant for a period of a year or more, and then could be issued again afresh. Our knowledge of the extent of the change effected in different paints and paint materials under different conditions of storage was somewhat meagre, and would probably lead to some difficulties; but these would, no doubt, be overcome by the exercise of some patience and work.

Mr. J. G. MCINTOSH thought one of the difficulties would be the expense to the Society of producing, printing, and publishing a colour book. Mr. Jennings had devoted a great deal of attention to the question, but he had not had the experience in a paint factory, where it was very difficult to obtain the same colours twice from the colour house, and that difficulty was still greater in connection with distemper. Then, why did Mr. Jennings make no attempt to standardise white and black paints? There were as many variations in the whites and blacks on the market as there were in the shades of other paints. Then, were the Society to dictate to all the world what, for instance, was a pure blue? He did not think he had ever seen a really pure blue until a week previously, when approaching the German Ocean from an upland position a good mile off the shore, and that, in fact, was a sea blue, which on a nearer approach would be degraded into sea green; and at what point were they going to draw the line of demarcation between a sea blue and a sea green? How were they going to differentiate between sea blue and sea green, as to where the one left off and the other began? On the market it was possible to obtain samples of Prussian blue which mixed with white lead would produce a pure blue, although out of thirty samples there would possibly be only one really pure blue; all the others would possibly verge towards sea green. Then there was vermilion and vermillionette which approximated to each other. What was to be done in that case? If a

firm ordered ten tons of ultramarine blue per week for ten years from the same ultramarine makers, and took a fair average sample every week, they would not get two samples alike. The tintometer was of no use in connection with paints. Take emerald green of dazzling brilliancy when dry, in oil it gave a paint which could be only compared to a pea-soup whitewash and there was an emerald green in Mr. Jennings's book as black as a hat. Any standardisation would be a millstone round the manufacturers' necks, and he pleaded for variation in colour and not to be tied down to a hard and fast scheme.

Mr. BATTEN thought it had been shown that classification of every colour was a possibility because identification appeared to be. Mr. Lovibond had assured them that identification of any colour could be done in two minutes. If every colour could be identified then certainly all colours could be classified. But that was not the same thing as saying that every colour could be named. It would be quite possible to classify the colours by using numbers and letters, but the trade would perhaps not take notice of it, and a purchaser might not care to order a colour as "KL47892." He suggested that the classification of thousands of colours and tints must be a mere letter and number classification; every colour must have its index, but only a few colours could have names. He doubted whether it was possible to make the names fit in with any scientific interval in the scale of colours. The nomenclature would have to be arbitrary and as far as possible coincide with names recognised in the trade. It might be decided, for instance, that a colour which in the list was KL 4793 should be called peacock blue. *No pigment name should be employed in the list*; to call a colour cobalt would pave the way to fraud. So far from agreeing with Mr. Heaton to abolish silly names he thought they were the only ones that could possibly be used. We should still need the help of the peacock and the canary. The fact that they were "silly" showed that they were arbitrary, and they must be absolutely arbitrary. If the principle were definitely accepted that every pigment name must be eliminated, and if a complete scientific index were made with an arbitrary nomenclature dotted in where it was found the index number coincided more or less with a popular name he thought such an index might be of great value.

Mr. MATT. GARBUTT said there could not be very much doubt as to the desirability of a standard card, but in making the standard series of tints he took it that at first there would be no attempt to be as comprehensive as the French series, of which samples had been shown, which was a very ambitious scheme. In an arbitrary way a selection would have to be made of the most useful tints for ordinary house painters' work, and those would be fixed first. If the scheme was not too ambitious he thought it would be practicable. It would not be possible to invent specific names for 60,000,000 odd colours, but something could be done very much akin to what the Chinese had done with their writing. They started off with a considerable number of radicals, by whose means they classified the characters standing for different ideas and objects. The students had difficulty in memorising the whole of the radicals, but every schoolboy had to learn a definite selection, 214 in number, and combine them in all manner of ways in order to build up characters. If he became a first-rate man at the University he might have to learn 11,000 or more characters before he could read some of the classic books. Probably in the standardisation of colours there would have to be headings, corresponding to the Chinese radicals, such as red, brown, green, and so on, with subheads; and then they would have to fall back on numbers. The objection that it was no good referring to a colour by a number alone would then be destroyed, because the heading would give an indication as to what the colour was. The formula would be, for instance, "Red, vermilion, No. 42." With regard to separating the names of colours from the material producing the colour, that would certainly have to be done; it would have to be colour and nothing else, with no indication as to how it was composed. He thought standardisation was very desirable and quite practicable.

Mr. NICHOLSON said that as a manufacturer, with a knowledge of what some other large manufacturers thought, he would say distinctly these manufacturers would not accept standardisation, because it would destroy, to a large extent, competition, which in the paint trade was very keen at the present time; so keen, that a good many firms could only obtain an order by showing a shade which suited a customer better than the one he was already buying. In the ready-mixed paint and enamel trade the number of different brands were practically the same in composition, and it was only by showing a better shade card that a firm obtained orders against their competitors. He thought that before any further steps were taken the question should be answered as to whether the manufacturers and colour merchants would accept standardisation if it were adopted. He did not think they would.

Dr. SEYMOUR said that, as a professional man unacquainted practically with the matter, it seemed to him there were two ways of looking at the question of colour standardisation. Originally vermilion and cobalt implied colours which were reduced when certain chemical substances were formed, and therefore a theoretical definition of some colours would be that they contained certain chemical ingredients in definite proportions. That, however, did not apply to such colours as peacock blue, a name which was not based upon any definite foundation, but by matching the colour of the bird. That might be called the analytical method. The other method was that described by Mr. Lovibond, whereby the colours were standardised in connection with their ray composition. A colour containing certain rays in certain proportions could always be reproduced by a mixture of pigments. The fundamental colours would be the six in the spectrum, and all colours must be combinations in greater or less proportion of those six fundamental colours. Vermilion originally meant a sulphide of mercury, and cobalt a salt of cobalt, but they meant now colours giving a certain ray composition. Those various shades could be made and matched by the method Mr. Lovibond had suggested. With regard to the two splashes of colour shown against different backgrounds by one of the speakers, it was illustrative of a well-known physiological fact. A green on a red ground looked quite different from a green on another ground, but that had no serious bearing on the question, because any person matching a colour would certainly know of that law from experience, and would not match against a background causing a physiological variation in the colour. The variation in the colour of the spectrum under different lights was a point that did not seem to be thoroughly understood. Two colours that matched in daylight would probably not match when viewed by gas or electric light. The colours were caused by the vibration of the particles, the vibration putting in motion certain rays which were conveyed to the eyes as a sensation of colour. In daylight two colours had all the rays coming to them from the sun, but gaslight contained only a small proportion of the rays which sunlight contained, and if one of the colours contained particles which responded only to a ray in the sunlight, which was not in the gaslight, that colour would not be the same by gaslight, and the colour would therefore look different.

Mr. MARTIN thought every manufacturer would know what was meant by Venetian green, although it was practically a thing of the past. It was a varnish green used for Venetian blinds, and the word "blind" was dropped out. It was as nearly as possible the deepest shade of green in the spectrum. He believed there would be very great difficulty in bringing standardisation into operation, and that when the scheme was submitted to paint manufacturers they would pooh-pooh it. It would be something like trying to influence a decorator to use white zinc in the place of white lead; he was so used to carrying on his business in the old-fashioned way that he would not listen to the suggestion.

Dr. M. B. BLACKLER said that some weeks ago the Council were discussing the lectures to be read before the Society, and he called attention to a book published by the Institute of British Architects, and suggested that a discussion should take place in the Society on the subject, whereby the lecture delivered on the last occasion originated. Then Mr. Jennings, in a private interview, stated it would be desirable to introduce a standard colour scheme on the same lines. The idea was formulated on the assumption that the Society had taken up a middle position; it was a society combining in its membership science and practice, and therefore any scheme that might be attempted need not have the scientific accuracy which certain people seemed to demand, while at the same time it might be, nevertheless, suitable for general use. At the present time manufacturers produce colour cards, in many cases not according to any set idea, but the colours being chosen according to personal bias of the man choosing them. The object of the present scheme was first to select fifty or sixty of the more common colours chosen, as had been done by a well-known firm, and the tints made up into a book by the Paint and Varnish Society. If the manufacturer would not use the book, the Society would still be in a strong position, because the object was to put it into the hands of architects. If the manufacturers would not provide what was required, architects having the book would suggest to their customers that they could follow it, and the manufacturer would find it desirable and convenient to supply the standard tints. Consequently, in course of time, they would be compelled to work according to the standard book, and would ultimately come to the conclusion that it was much more satisfactory than the rule of thumb method now prevailing. Many members spoke as if paint manufacturers always supplied pure colours, but that was

a mistake. They supplied tints, and the tints were not always made up of pure colours, but were brought to standard by means of various pigments. From a practical point of view many different pigments could be used to produce the same tint. He agreed with Mr. Jennings as to the possibility of a number of the representative societies uniting in picking out the few colours necessary and in that way producing a book of standards that would be of great value.

Dr. Blackler then moved, "That a committee be appointed to take measures to issue by this society a British Standard Colour Card of Paints and Distempers."

Mr. J. CRUICKSHANK SMITH did not think the time had come for the Society to take a definite position in the matter. The opinions expressed that evening had been exceedingly instructive; in fact, he did not remember a debate during the last two years that had been so instructive, or had led to such a conflict of opinion. Before deciding to do anything in the matter there should be an opportunity of discussing it in the Council, so as to discover the best means to be adopted, or whether it was a matter that ought to be adopted at all. He was not at all clear that such a thing was feasible or advantageous, but he had quite an open mind in the matter. Still the Society ought not to proceed too precipitately, and he therefore moved as an amendment, "That while recognising the importance of the matters raised by Mr. Jennings, this meeting does not think that the Society should commit itself to a definite line of action at present, and asks the Council to consider the whole matter and report."

This was seconded by Mr. C. HARRISON, and being put to the meeting was carried. The original motion was then withdrawn, and the amendment put as a substantive resolution, and carried.

Mr. JENNINGS, as the hour was late, made his reply upon the discussion very short. He said the whole point was that three different bodies would decide on naming a certain colour or hue, and that would be issued in the book and the manufacturers might at first pooh-pooh it, but when they got a large number of orders for that particular shade, say, of myrtle green, they would no longer pooh-pooh it, but immediately set to work to make that shade. The dissociation of names and pigments he thought was highly desirable. He could not follow Mr. McIntosh in his arguments, nor quite follow Mr. Bussell. It was quite true that a colour in position would not look the same as in the book, but a man wanting to choose a tint of light green for a ceiling would take the card and look at the colour when in position. That was almost always done, a small portion of the colour being tried on the spot to see whether it had the desired effect.

The proceedings then terminated.

UNIVERSITY OF LONDON LECTURES ON ARCHITECTURE.

MR. EANISTER FLETCHER continued the subject of Early Christian Architecture in his lecture at the British Museum on Tuesday, March 7.

With the spread of Christianity places of worship for the new religion were erected in every part of the Roman Empire; in some instances pagan temples were converted to the uses of the new faith, as seen in the Cathedral at Syracuse, originally a Doric temple of Minerva, where openings were made in the cella wall, forming aisles, and the spaces between the columns of the peristyle were closed in, thus giving an enlarged interior; but more often new buildings of the basilican type were erected.

Examples of Early Christian work are to be found at Ravenna, Torcello (near Venice), Syracuse in Sicily, and Eastern Europe; Bethlehem and Jerusalem; and in the Eastern Roman Empire, Constantinople, Salonica, Istria, and Egypt, especially around Cairo, but time would not allow, the lecturer said, to deal with the latter.

The importance of the city of Ravenna, which at one time rivalled Rome, accounts for the number of very beautiful Early Christian churches we find there, dating from the fourth, fifth, and sixth centuries. It was created an archiepiscopal see in 438 A.D., and was the residence of the Gothic kings from the time it was taken by Theodoric in 493 until 539, when it became the seat of the Exarch of the Eastern Roman Empire until 752.

The Church of St. Apollinare Nuovo (Ravenna) was erected by Theodoric as an Arian cathedral, but in 570 it was converted into a Catholic church. It is of the basilican type, having three aisles and plain external treatment. The

entrance at present is through a narthex, but originally an atrium formed the approach. To the side of the church is an example of one of the earliest bell towers. In the days of persecution the faithful were summoned secretly to the services by messengers; in later times wooden clappers were used; and finally, towards the sixth century, bells were placed in towers adjoining the church erected for the purpose.

The nave arcade has twenty-four columns, which support semi-circular arches springing direct from the dossier or impost block, which was usually a square, deep block of marble placed over the capital in order to strengthen its appearance, and the better to carry down the line from the arch to the column, in some degree replacing the entablature. The Corinthian capital was not designed to carry an arch, but a horizontal entablature; its hollow bell-shaped outline seemed little adapted as a support to the weight of an arch, and by degrees special capitals were designed having a convex outline, which were better suited to the work they had to perform.

The long blank spaces above the columns corresponding to the triforium of a Gothic church seemed eminently suited to treatment in mosaic. The town of Classe is here represented, with buildings, sea and ships; a procession of twenty-two virgins robed in white and gold, and the three Magi approach the Madonna, enthroned between angels. The whole is executed in brilliantly coloured mosaic. On the opposite side is the city of Ravenna, with its church and palace of Theodoric; twenty-four saints with wreaths approach the Christ enthroned, with angels on either side. The spaces between the windows are filled with apostles and prophets in mosaic representing niches with shell-covered vaults.

St. Apollinare in Classe, dating from 534-539, is very similar in plan and treatment; it was built on the former site of a Temple of Apollo. Its circular campanile is the oldest known.

The lecturer then dealt with the Syrian examples, the Church of the Nativity at Bethlehem, and the Church of the Holy Sepulchre at Jerusalem. He referred to M. de Vogué's "Architecture of Central Syria," in which the extreme scarcity of wood is mentioned, and the consequent entire use of hard stone (which abounded) for doors, windows, and even for roofs. The Church of Qalb-Louzeh, dating from the sixth century, is built entirely of coarse stone.

The Church of the Nativity was erected by Constantine over the traditional birthplace of Our Lord in 330 A.D. Justinian (527-565) restored it, and again in the fifteenth century it was repaired, King Edward IV. of England giving lead for the roof and Philip of Burgundy the pine wood.

In the seventeenth century the Turks stripped the roof to make bullets of the lead. The church is now the joint property of the Greeks, Latins, and Armenians.

It is of the typical basilican plan, 215 feet long by 103 feet wide, having double aisles and transepts; there are apses at either end of the nave, the choir end being triapsal, and beneath it the crypt, which also consists of three chapels—the Chapel of the Nativity, the Chapel of the Manger, and the Chapel of the Holy Innocents. The spring which served the Holy Family is also here.

The unfuted monolithic columns of the church measure 19 feet in height, and were specially made for the building by Constantine's order, never having served in any pagan temple, as was the case with most of the columns in the early churches. The order is Corinthian, and supports an entablature and not arches. The plain wall of the clerestory is 32 feet high, originally treated with mosaic, of which there is but little left. The roof dates from the seventeenth century. The Chapel of the Nativity is paved with marble, with which the walls are also lined. There is an altar in the small semi-circular recess, which is treated with mosaic, dating from the time of Constantine. A silver star is set in the pavement, with the inscription, "Hic de Virgine Maria Jesus Christus natus est."

The Church of the Holy Sepulchre was also built by Constantine over the reputed tomb or sepulchre of Our Lord. It was rebuilt by the Crusaders and altered and defaced by the Saracens. The dome is of modern times. In character, as seen to-day, it resembles the architecture of Sicily and Southern Italy of the twelfth century. Originally a colonnaded atrium led to the basilican body of the church, which adjoined the rotunda which is over the Sacred Tomb. The whole was rebuilt by the Crusaders in 1099. An apse was added to the rotunda in 1103 to 1169.

This type of building has frequently been copied, as seen in Charlemagne's tomb at Aix-la-Chapelle, the Church of St. Gereon at Cologne, Little Maplestead Church in Essex, and the Temple Church in London.

Mr. Fletcher then proceeded to deal with the baptisteries and tombs of the Early Christians. In the early days of the Church the sacrament of baptism could only be administered by a bishop; for this reason, the baptisteries in each city are found attached to cathedrals and not to parish churches. The ceremony took place at the three great festivals of the year, when people flocked from all parts; it was consequently necessary to erect special buildings large enough to receive them. Baptism in those days was by immersion, and often the porphyry baths from the thermæ were made to serve. It was not until the sixth century that the font was introduced.

The oldest baptistery is that of Constantine, which forms part of the basilican church of S. Giovanni in Laterano. For many years it was the only baptistery in Rome, and it served as a model for later buildings. S. Maria in Cosmedin, known as the Baptistery of the Arians, and S. Giovanni in Fonte at Ravenna are other examples which were described.

The tomb of the daughter of Constantine, S. Costanza at Rome, the tomb of Galla Placidia at Ravenna, and other tombs were also discussed by the lecturer.

THE ILLUMINATING ENGINEERING SOCIETY. THE LIGHTING OF SCHOOLS.

A MEETING of the Illuminating Engineering Society was held in the rooms of the Royal Society of Arts on Thursday, February 16, when a discussion on "School Lighting" took place. The President, Dr. Silvanus P. Thompson, F.R.S., was in the chair.

The Hon. Secretary read the minutes of the last meeting and also the names of applicants for membership.

The President then called upon Dr. James Kerr, Medical Officer (Education) London County Council, to read a short paper on "School Lighting—Natural," as follows:—

When a doctor attempts to introduce a technical discussion before a company of experts he must be excused if he deals with it in a baldly practical manner, and not in the finer and more scientific way which would be most interesting to the members of this Society.

I have to deal shortly with school lighting under natural conditions, Mr. Bishop Harman introducing the subject of artificial lighting.

It is in consideration of eye diseases that school lighting is of most importance to the doctor. The first man who worked extensively at school lighting was Dr. Hermann Cohn of Breslau, on whose tombstone may be read "Augenkrankheiten zu verhüten betrachtete er als seine Lebensaufgabe," and it is interesting to know that it was from his work that modern school hygiene has developed both in Germany and in this country.

Cohn's work was mainly occupied in investigation of the working conditions of the individual child, which indeed is the best way of examining the question.

His method of testing the lighting in the various parts of a school-room was by using the Weber photometer, which is too well known to need description here. He worked out the great variations with seasons of the year, and also distances from the windows. This still requires charting for the normal school-room.

For school purposes Wingen's photometer has been used in the London schools, and Mr. Harman will speak of it.

Cohn, however, recommended a simpler plan, which incidentally throws a side light on the German schools of forty years ago in his suggestion to count the number of scholars in each room from whose place no part of the sky is visible. Then he developed the idea of the measurement of the solid angle of sky seen from each place by measurement with the stereogoniometer or Raumwinkelmesser, as he called it, devised by Weber for him.

He used a lens of 11.5 cm. focus to throw an image of the window on a paper divided up into squares of 2 mm. side. On counting up the number of squares in the area of the image of the sky, and multiplying by the sine of the angle of inclination of the lens he got a number which he called the reduced solid angle, and which was equivalent to the area of sky overhead which would equally illuminate the spot measured. This method is approximate and yet tedious, but quite within range of errors of experiment for practical school purposes. I have taken a hint from the pin-hole camera of Pleier, who photographs the window with a pin-hole, and places a gauge made by calculation over his photographic plate. Calculating out the solid angles, and reducing them, one gets a chart which, when photographed by a lens in a certain position, yields a gauge of reduced solid angles for

any image thrown by the lens. Using a small camera obscura and spectacle lens a little apparatus is made for a shilling by which more rapid results can be permanently recorded on thin paper with the gauge than by more costly apparatus.

These methods, however, only measure direct skylight, and neglect reflected light, which in a properly arranged school-room is of great importance.

Another instrument has been used which is very neat and convenient, and which enables one to measure the relative distribution of light in a room, measuring the illumination from all sources in relation to the direct light from the sky. This is Thorner's light tester. The surface-brightness of a card on a spot to be tested is viewed through a small hole in a white diaphragm of the instrument. On this diaphragm by means of a small mirror and lens an image of the bright

sky is thrown. Stops $\frac{F}{5}$, $\frac{F}{6}$, or $\frac{F}{7}$ can be used to vary the brightness of the image. $\frac{F}{6}$ is generally used if the place is

not bright enough for school work. The card appears dark through the hole, otherwise it appears brighter.

Probably by using an iris diaphragm, and carefully graduated scale, this instrument could be made to give relative values for the illumination at any point in a room.

A more elegant little instrument, which I only know from its description to this Society, is the "Holophane Lumeter," devised by Messrs. Dow & Mackinney. It appears to be portable, accurate, and capable of measuring the surface-brightness of any part of a room, so that it will be of value in determining the reflective power, for instance, of materials for walls or curtains, as well as for measurements of the lighting on school desks. This, of course, gives quantitative measurements, and does not compensate like the last instrument for varying sky brightness.

From the descriptions given it will be seen that measurements of various kinds are made by these different instruments, of which there are numerous varieties, and of which I have only quoted types:—

1. The measurement of solid angle of sky, which only gives direct illumination from the incident light, and except as regards minimum measurements is not of much value.

2. The measurements by photometers (Weber's, Wingen's, the Lumeter) give quantitative results, which, for scientific investigation of lighting are a necessity. With light which varies enormously day by day, hour by hour, and inch by inch, it is doubtful how far exact measurements are wanted, at least by the ordinary school doctor, who has to pass an opinion on school lighting.

Very much depends on the eye itself. The eye and ear are about balanced as gateways of knowledge in school; perhaps the eye is the more important.

In the very young school child the mental effect seems largely proportional to the volume of retinal stimulus. The larger the image of a letter, for instance, the better it is recognised. There is a mental concentration required to recognise a letter which is quite well known, but which is also projected as a very small image on the retina. This means fatigue, which the young child always avoids as far as possible. Again, the undergrown or underdeveloped eye of the young child with its short axis means an excessive amount of effort of the ciliary muscle to accommodate the lens and focus the image on the retina, especially for near things, and I think young children often give up the fatigue of accommodating to get a clear image, and by bringing their heads nearer the object get a large image, not so well focussed perhaps but giving a greater retinal stimulation. Poor illumination affects this retinal stimulus and leads to the eyes coming nearer the work, and this short eye to work distance is the earliest and worst school habit in its ultimate effects on the eyes, if these are in any way liable to damage. So that good lighting is particularly necessary in the infant departments.

Again, many years ago, being struck by the variable results of eye testing in a well-lighted room in one school on a hill, on tracing out the cause it was found that this was due to a reading lesson taken in a room exposed to the west, with the afternoon sun causing a certain amount of glare effect and fatigue on the eyes when they were tested in another room.

For this reason the test types which I had drawn in 1894 to be available at all distances from 10 to 20 feet, had a series of square dots added 1.4 millimetres side and 1.4 millimetres between each square. This is seen clearly by a normal eye as a row of square dots at 20 feet if the light is sufficient for

eye testing, but becomes fused into a line if the light is too poor for use.

On the other hand to test readily illumination in its effects on the eye, I mounted test type of the size known as J₁, on a glass slide, to keep it clean, and used it at a distance of half a metre, as a test of sufficient illumination. This neglects the accommodation, and in a hypermetropic person or anyone above 40 years of age it would be necessary that correcting glasses for this distance should be worn. If that is done then probably for all practical purposes the reading of diamond type at half a metre gives security that the standard of minimum illumination is attained.

The lighting of the school-room depends principally on the window area. For most of the work done in school it is advisable that the light should fall from the left. The windows on the left side of the room should be as large as possible from the point of view of lighting. They ought to be at least one-fifth of the floor area. Questions of ventilation and loss of heat in winter cooling and draughts make too large windows costly in heat.

Skylights, which are used in industrial buildings, might be used so far as lighting was concerned, but there are difficulties about heat in summer, and rain or melting snow in winter.

Window lighting facing the children ought not to be permitted, and conversely windows behind the children when the children sit in their own shadows ought now to be stopped. There are many rooms still existing, with this defect; and it is somewhat absurd to walk into a class-room of girls and find the girls sitting on the desks with their feet on the seats, doing their sewing, so as to catch the window light, which in the ordinary position at the desk they would lose.

The rapid diminution of light with distance from the window, which the photometer shows even in the length of one's own writing table, makes it inadvisable to have class-rooms wider than about 20 feet. Practical considerations of ventilation make 13 feet about high enough with these dimensions.

A class-room for 36 to 40 children, which is about the standard size likely to be attained, would therefore be 20 or 22 feet wide, and would have about 120 square feet of window surface, beginning about 3 feet 8 inches from the floor and extending to the roof.

Many rooms, however, are capable of great improvement by proper colouring. All class-rooms above 5 feet from the floor should be coloured very lightly, almost white. Beams and rafters cause much loss of light, and as they are generally stained darkly, a coating of white paint should always be ordered.

Where there is insufficient window area all the aid possible is required from reflected light and the more distant parts of the room may require some help by the use of prism glass or of external reflectors. In using these aids care must be taken to avoid glare effects.

Glare arises when the brightness of illumination of an object whose image falls peripherally on the retina is relatively great compared with the object whose image is centred on the yellow spot. Light incident almost horizontally on the eye from ribbed glass or prismatic glass, especially if there is sunlight falling on the glass, is often very irritating in this way. The glass itself may be unsatisfactory. All kinds of obscured glass are objectionable, and so, too, unless it is absolutely necessary to ensure privacy for instance, patterned glass should be avoided. But windows often have their light transmitting capacity influenced in other ways. Not long ago I spoke of the windows of an infants' school as requiring the ground glass removing, and found that it was merely dirt.

Lastly, although hardly within our subject, there is the consideration of whiteness of paper and character of ink. The Gothic print, for instance, is a serious handicap of the German school child, and some of the watered ink and poorly printed stuff seen in schools, even when badly lighted, is well worth the attention of school inspectors.

We may sum up then by saying that for the best effects of natural lighting in schools, properly planned schools with sufficient window area of clear glass, and well coloured walls to distribute the light are required; and further, that attention should be paid to the pupils' position, and also to their attitudes; that their work should be such that clear images can be formed on the retina without excessive fatigue.

The President said that unfortunately the author of the second paper, which was on artificial lighting, was unable to be present, he was sorry to say, through illness. Mr. Harman hoped to be present at the next meeting, when the discussion would be continued, and intended then to show some lantern slides to illustrate his paper. As Mr. Harman's

paper was relied upon to introduce the subject of artificial lighting, it would be necessary for it to be read in some form, and he would therefore ask Mr. J. S. Dow, the Assistant Hon. Secretary, to read it.

(To be continued.)

The King Edward National Memorial.

(The Lord Tenterden Crystal Palace Memorial.)

SIR,—Although a great deal has appeared in the daily press, and we have distributed a great many thousand circulars and forms, and sent details of the scheme to every inquirer, we yet receive many communications asking why we make no public appeal for funds in the press. We therefore beg to be allowed through your columns, in conjunction with the whole of the daily and weekly press, to definitely invite subscriptions for the purpose of acquiring the Palace as a National Memorial of our late beloved King; for renewing and modernising its departments and attractions; placing it at the service of the nation for ever; and devoting all its profits to national and popular objects. The control of the Palace under the proposed régime will be vested in fourteen persons.

Four persons appointed by the Government (two from the House of Lords and two from the House of Commons);

Four persons appointed by those who contribute over 1,000l. each;

Four persons appointed by this Council; and

Two persons appointed by the Lord Mayor or his committee.

Subscriptions are being received daily. Cheques should be crossed Lloyds Bank, St. James's Branch, and should be sent addressed to the Hon. Treasurer, the Right Hon. the Earl of Kinnoull, 26 Shaftesbury Avenue, Piccadilly Circus, London, W. A certificate entitling its holder to life admission to the Palace on completion of the scheme is given to each subscriber of one guinea and upwards. And each contributor's name will be placed upon the Great Historic Roll, which will be placed in the Palace.

To accommodate the poorer sections of the community and those who wish to enter their whole family, subscriptions are being received in instalments spread over one year.

Thanking you for allowing us to make this very brief appeal,—Yours faithfully,

TENTERDEN, *Chairman.*

KINNOULL, *Hon. Treasurer.*

Council Office, 26 Shaftesbury Avenue,

Piccadilly Circus, London, W.:

March 15, 1911.

SIR,—Will you permit me through your columns to draw attention to the following proposition submitted with good effect to the County, City, and Borough Councils of London:—"That the Crystal Palace and grounds, when acquired, should constitute London's gift to the Empire; to be main-

tained at the expense and by the joint control of the Parliaments in the King's dominions"?

The Paddington and Stepney Borough Councils have already concurred in this suggestion. In no case has an adverse view been expressed. Sir Homewood Crawford, city solicitor, writing from the Guildhall, states that he "welcomes this suggestion." Lord Rosebery has been good enough to state, with special compliments, "that he is by no means adverse to the idea." The Duke of Argyll endorses the proposition, and says "he hopes that the Crystal Palace may be preserved for its beauty and because there is no place so good for the people's entertainment." View after view might be given of prominent public men in sympathy with the suggestion.

The Prime Ministers of the overseas dominions, with but one neutral exception, are in general sympathy with the Crystal Palace as an "Exhibition Empire Centre."

Almost as much can be said for ex-Prime Ministers and Opposition leaders.

The following expressions from a few Australian Labour M.P.'s might be taken as typical.

Senator Hugh de Largie (Government Whip) refers to the matter in terms of "Pegging away at the good work of Empire cementing, which is even more necessary now than some time ago, seeing that we have lost such an able and energetic King as his late Majesty. Wishing every success."

Dr. William Maloney, writing in a eulogistic strain, states:—"I support the Domes and Grounds of Empire."

Frank Anstey writes:—"A magnificent idea. In all England there is no more suitable place for the realisation of your conception than the grounds of the Crystal Palace." Mr. Thomas Tunnecliffe says:—"The proposal has my hearty endorsement. It is a great scheme, and I hope the matter may be taken up. Something of the kind is urgently needed, and you seem to have struck the right idea." (Melbourne, May 16, 1910.)

Thus the voice of Australian Labour. Mr. Alfred Deakin writes, taking pains to describe his action in giving sympathetic effect in a practical manner to his appreciation of the suggestion. So might be mentioned other Opposition and Ministerial members in all the Australian Parliaments, together with very favourable press comments. The same can be said of New Zealand, South Africa, Newfoundland, and Canada, which might be summed up in the words of the Hon. Amédée Forget, Lieutenant-Governor of Saskatchewan:—

"The aim of 'Domes and Grounds of Empire,' which I have read with interest, and your patriotic enterprise for having a permanent object-lesson ever before the eyes and minds of the subjects of the Empire in the grounds of the first International Exhibition, is worthy of the approval of all who claim the British heritage." (Regina, Canada, May 28, 1910.)

The loyal press of India is equally enthusiastic. And now, pending the decision or otherwise of the Crystal Palace and grounds becoming a memorial to the late King, will you permit me to urge that if, as "London's gift" the historical Crystal Palace and grounds became the property of the Empire, it would, as an Empire centre, exercise a far-reaching influence?

I have discovered during the last few years that comparatively few persons are against the resuscitation of London's old pleasure resort on the lines indicated. Perhaps not more than one person in a thousand. The desire for welding together the scattered forces of the Empire by a form of rendezvous will not, so far as Australia is concerned, be entrusted to any influence other than national, or the joint ownership and control by the Empire.

The "Grounds of Empire" held in common by the Parliaments in the King's dominions would be a guarantee against failure or degeneracy of aim.

Knowledge and a deeper sense of responsibility of Empire citizenship, improved trade relations, and the discovery of new and wider markets, would mark each year with increasing success. A nominal charge for admission would make this elevated "Land Mark of the Empire" self-supporting, ensuring a fund for the provision of novel and elaborate attractions, varying with the rotations of season.—Yours truly,

Gascoyne, Snakes Lane, Woodford Green: W. A. BAYST.

March 16, 1911.

Mr. A. B. PLUMMER, diocesan architect, has been instructed to prepare plans for the proposed enlargement and repair of Wooler Parish Church. The preliminary project is for work at an estimated cost of about 3,000l.

THE CATHEDRALS OF NORTHERN FRANCE.

THE wealth of Northern France in the most remarkable examples of the ecclesiastical architecture of the middle ages, and particularly of the thirteenth century, will ever make this corner of Europe a happy hunting ground for the student of Gothic art. Any attempt to incorporate an adequate description of the church building of mediæval times as exemplified in Northern France in one volume must result in an overwhelming size of that volume; hence we are not surprised to find in the latest of the popular guides* to ancient architecture that Mr. T. FRANCIS BUMPUS has given to the public a perhaps somewhat arbitrary selection and restriction of examples.

The church architecture of Brittany has so many salient points of difference from that of Normandy and the Isle de France, that the Breton cathedrals of Rennes, Quimper, Saint Brieuc and Vannes might very well be separately considered, but an account of the cathedrals of Northern France which omits Auxerre, Laon, Lisieux, Noyon, Senlis and Saint Omer is essentially devoid of completeness, both for the tourist and the student. The tourist, in visiting the cathedrals described by Mr. BUMPUS, must pass others of which no account is given. The student can scarcely understand thoroughly the development in France of Pointed Gothic architecture without reference to Laon and Senlis.

We must understand, therefore, that the book now before us gives a description of some only of the cathedrals of Northern France, the limitation being to those churches which are actually the seats of bishops at the present day. The scheme of arrangement is not in any way chronological, but to a certain extent topographical in that the several cathedrals described are grouped in their respective archiepiscopal provinces. Thus Amiens, Beauvais, Châlons and Soissons follow Rheims; Bayeux, Coutances, Evreux and Seez are grouped under Rouen; Blois, Chartres, Orleans and Versailles under Paris; Arras under Cambrai; Le Mans, Angers, Laval and Nantes under Tours; Troyes, Nevers, and Moulins-sur-Allier under Sens.

Before proceeding to describe in detail each of the churches he has selected from the cathedrals of Northern France, the author, in an introductory sketch, prepares his readers, whom we may take to be mainly intelligent tourists and amateurs of architecture, for particular study by a general exposition of cathedral building in France and the relative position of the Church and the State. In this he points out that the French cathedrals, unlike our own, were mainly the work of the secular clergy rather than of monastic bodies, and erected as a counterblast to the bid for popular favour made by the monks.

Thus it is that the cloister, the chapter-house, and other collegiate buildings are so rarely found in conjunction with French cathedrals. Another interesting point to which the author alludes is the multiplicity of "Uses" in the Gallican Church, which thus, as in other ways, showed its partial independence of the see of Rome until the time of NAPOLEON III.

The descriptions of the individual cathedrals of which the author treats begin with Rheims, characterising which he quotes the expression of an eminent French antiquary—"Le Parthénon de notre Architecture Nationale." The history of the church is given and the claims of the various architects whose names are traditionally associated with its erection are discussed. In his "Foreword," however, the author is able to give some later information which he has obtained from M. DEMAISON, the Municipal Archivist of Rheims, who communicates the fact that the cathedral of Rheims was begun on May 6, 1211. JEAN D'ORBAIS furnished the plans for the whole building, carrying out the choir and probably the greater part of the transept. His successor was JEAN LE LOUP, who directed the works for sixteen years. He undertook part of the nave, and also the great western front, which was continued by GAUCHIER DE REIMS from 1250 to about 1260. Following him was BERNARD DE SOISSONS, who constructed the nave from the fifth bay to the ninth bay inclusive, and the great circular west window. BERNARD continued to carry on the work till 1287, soon after which date ROBERT DE COUCY became Master of Notre Dame, and to him are attributed the four first western bays of the nave. In his discussion of the authorship of the design of Rheims Cathedral, Mr. BUMPUS brings in WILARS DE HONECOURT and his sketch-book as an illustration of the life and manners of mediæval architects.

The chatty style in which the author discourses of the history and the architectural treatment of Rheims and the other cathedrals that he describes is eminently suited to please the non-professional reader or tourist, and yet withal there is so much scholarship and just comparison of the particular building under review with others not only of France but of other countries of Europe that the book becomes valuable to serious students of architecture. Nor does the scheme of the author restrict him to mediæval building. The cathedral of Arras, completed in 1833 is, for instance, an example of modern Classical work, replacing, as it does, the mediæval cathedral.

From the same cause we have the inclusion of such a late Gothic cathedral as Nantes, the only one in France completely of the fifteenth-century style, and hence a specimen of the capabilities of the Flamboyant phase of French Gothic.

In all his descriptions Mr. BUMPUS is careful to include a reference to the stained glass and to the most promi-

FROM THE LECZINSKI BUREAU.—By RIESENER (Wallace Collection).

ment of the accessories that play so important a part in the general effect of mediæval cathedrals.

The illustrations in the book, although small in size and limited in number, are beautifully clear and sufficiently whet the appetite for a personal acquaintance, to render which the more intelligent we take to be the object of the author's handbook. Plans of eight of the cathedrals are given, which, if not sufficient for the serious student, are at least illustrative of varied treatments of the chevet plan.

NOTES AND COMMENTS.

THE general chorus of disapproval with which the proposal for the London Memorial to King EDWARD VII. has been received is not, in our opinion, without justification. The great charm of St. James's Park has been its freedom from formal gardening. More than any other of the London parks, it has preserved the character of *rus in urbe*. It is, moreover, but a small place, although the fact is at present artfully and artistically much concealed. Hence it possesses a cachet of its own that is unique amongst London's open spaces.

THE especial character of the park is entirely opposed to anything like planning in the grand manner, and the changing of the Mall into a processional road, with the whole scheme of the VICTORIA Memorial has to a large extent altered the atmosphere of the *locale* and practically reduced the size of St. James's Park. One now feels that the park is distinct from the Mall, which is extraneous and beyond its boundary. This having been done, it would be fatal to cut in half what remains by a grand bridge and roadway.

WE could trust Mr. LUTYENS to design a new bridge over the lake which would not conflict with the character of St. James's Park, but we scarcely fancy that this would be such an approach to the grand memorial as Mr. MACKENNA has in view, which latter, we quite agree, is no more than is fitting to commemorate the regard of London for King EDWARD. A grand memorial is all right, but St. James's Park is not strong enough to bear it. This, we think, is the vital error in the present proposal. If the memorial were made part of the processional road and not part of the park, any new treatment of the bridge could be kept in harmony with the park, and Mr. LUTYENS could design such a bridge as well, if not better, than any other architect of the present day.

It should not be forgotten that a statue must have a back, for we can hardly expect Mr. MACKENNA, or any other modern sculptor, to symbolise the dual aspect of King EDWARD as a British sovereign and an English gentleman by a Janus-like presentment. A grand approach to the back of King EDWARD is, therefore, not required, and if Mr. MACKENNA can be persuaded to abandon his "Britannia" and terraces and adopt what

seems to have been the original idea of a screen at the back of the memorial, there would be no reason why a new bridge suitable to the park should not form part of the scheme.

KENSINGTON PALACE, as London's Musée Carnavalet, is ideal. The palace itself is one of the most valuable relics that we have of London as it was, and forms a fitting shrine for records of the past history and activities of the capital of the Empire. Our only fear is that Kensington Palace may all too soon be found to provide insufficient space for the many remains that might be collected illustrative of the life of Londoners from the Stone Age to the close of the last century.

SUCCESSFUL education demands competent teachers. The inferiority of the technical instruction in this country and the paucity of its results are largely due to an insufficient supply of such teachers. The only exception to this has been in the domain of art, and the superiority of art instruction to that of other branches of technical knowledge is due to the fact that Art has an university in the Royal College of Art, where art-teachers have been adequately prepared for their work of imparting instruction to others. The essential characteristic of the Royal College is that it trains its students in Art, not in painting, in sculpture, in architecture, in pattern designing, or in ornament alone. It does not, in short, attempt to make specialists of those who are deficient in general knowledge. Education comes before training.

HENCE we regret to learn that there is a possibility that the present position and methods of the Royal College of Art may be materially altered for the worse, if even it be not reorganised out of existence. To avert this evil fate a memorial to the Prime Minister has been addressed by a large number of members of the Royal Academy, urging that a royal commission should be appointed to take into consideration the co-ordination of the methods of art education pursued by different bodies, aided by public funds or otherwise, throughout the country. The memorial also calls attention to the educational purpose of the national collection of art treasures in the Victoria and Albert Museum.

THIS is, to our mind, of the utmost importance. A museum should not simply be a collection of more or less rare objects, through which the public may wander in a listless bewonderment. It should be regarded rather as a series of examples to illustrate the teaching imparted in an attached school. The value of the Victoria and Albert Museum as an educational agency would be immeasurably reduced if it no longer formed part of the apparatus of the Royal College of Art. Every museum ought to have a school attached to it, and to do away with a school that is closely connected with a museum is rank folly. If the school did no more than induce an intelligent appreciation of the museum its existence would be fully justified.

INTARSIA AND WOOD INLAY.*

(Official Report.)

By MR. F. HAMILTON JACKSON, R.B.A.

ACCORDING to the best authorities the word *intarsia* is derived from the Latin *interserere*, to insert, though there was a similarly sounding word, *tausia*, which was applied to the inlaying of gold and silver in some other metal, an art practised in Damascus, and thence called damascening—at first the two words meant the same thing, but after a time one was applied to wood and the other to metal work. In the Museo Borbonico the word *tausia* is said to be of Arabic origin; and there is no doubt that the art is Oriental. It perhaps reached Europe either by way of Sicily or through the Spanish Moors. Marquetry, on the other hand, is a word of much later origin, and comes from the French *marqueter*, to mark, to spot; it seems, therefore, as if it would be accurate to apply the former term to those inlays of wood in which a space is first sunk in the solid, to be afterwards filled with a piece of wood or other material of contrasting colour cut to fit it, and to use the latter for the more modern practice of cutting several sheets of differently coloured thin wood placed together to the same design, so that by one cutting eight or ten copies of different colours may be produced which will fit into each other accurately, and only require subsequent arranging and glueing, as well as for the perhaps more artistic effects of the marqueteurs of the seventeenth and eighteenth centuries, which were produced with similar veneers. I say "it seems as if it would be accurate," for one has a liking for accommodating one's opinions to what seems a logical deduction, but unfortunately facts are against one. At Ferrara Cathedral the stalls were inlaid with a fine series of perspectives, many of which are unfortunately now in very bad repair, but this disrepair unfolds to us the secrets of their manufacture. The wood upon which the design was developed has thick pencil lines scored over it marking the principal lines of the perspective, and except for this is a smooth plank. There is no sign of sinking or elevation, and it is therefore evident that thin pieces of wood of different colours must have been glued on to form the design in the same way as the later marquetry.

You will scarcely expect me in a poor hour's lecture to trace the historical development of the art in detail. It was made use of by most of the nations of antiquity, but the mediæval craft appears to have been derived from the East. In India elaborate and beautiful geometrical designs are still produced in much the same fashion as in the Middle Ages, for the possibilities of this form of design were exhausted by the Arabs in Egypt and the Moors in Spain, and in Venice there was a quarter inhabited by workmen of the latter race, who made both metal work and objects in wood. Except for the inlaid ivory casket in the Capella Palatina at Palermo, which seems to be a work of Norman times, we have no example of the kind which can be dated with precision before the appearance in the north of Italy of the similar *lavoro alla Certosina*; but since inlaying with small pieces of marble and vitreous pastes was practised in Central and Southern Italy certainly from the twelfth century, there is little difficulty in imagining how its use arose. This work has its derivative still existing in England in the so-called Tonbridge ware, which is made by arranging rods of wood in a pattern and glueing them together, after which sections are sliced off—the same proceeding in effect as that of which the Egyptians made use with rods or threads of glass. In the British Museum are small plaques of glass in which the design was made in this fashion. The wooden border inlays, however, often show considerable fancy and variety.

Historians are agreed that the cradle of Italian carving and inlaying was Siena, where there is mention of a certain Manuello, who, with his son Parti, worked in the ancient choir of the cathedral in 1259. Orvieto was another place where tarsia was produced at an early date, but the craftsmen were all Sienese; Maestro Vanni di Tura dell'Ammanato, the Sienese, made the design of the stalls for the cathedral in 1331, and commenced the work, some remains of which are still preserved in the Museum of the Opera del Duomo. Twenty-eight artists were employed on these stalls, but Vanni di Tura died before they were finished, and they remained incomplete till 1414, when Domenico di Nicolo is recorded as undertaking the work. In 1431 another master is mentioned, who was followed by yet two others. Only four kinds of wood are stated to have been used—ebony, box, walnut, and white poplar. Remains of so early a period as the fourteenth century are scarce, the

great triumphs of the art being much more modern. This Domenico di Nicolo worked for thirteen years at the chapel in the Palazzo Pubblico, Siena, using Taddeo Bartoli's designs: he was one of the best Sienese masters of intarsia and wood-carving, and his work brought him so much reputation that his family name of Spinelli was changed for himself and his descendants to Del Coro; while he was head of the Opera del Duomo in 1400. Unluckily, he is also an example of the small profit to be made even then by conscientious and careful work. Although he was proficient in several kinds of design, in 1421 he had to petition the Priors and Captain of the People for assistance on the score of his poverty, and had a pension granted him, in return for which he took apprentices—yet twenty-six years later he petitions the Signory again. He was then eighty-four years old, and complained that as the art was so little profitable only one pupil wished to continue working at it. That he thought he was pretty prosperous, and therefore resigned his pension (honest man!), but that the expenses of settling his family had been so great that he was unable to make both ends meet, having a sick wife also. He had been a kind of consulting architect to the authorities at Orvieto, having been called thither in 1416 to refix the roof of the cathedral, all expenses being paid if he came himself, in addition to a salary of 200 florins a year. Yet he ended his days in poverty, at a pension of two florins a month.

In early times the various arts connected with building were in close union (as they are here to-day), and it appears tolerably certain that one guild sheltered them all, proficiency being required in several crafts, and mastery in one. We find the same man acting in one place as master builder or architect, sometimes only giving advice, while elsewhere he is sculptor or wood-worker. Similarly the painter, the mosaicist and the designer for intarsia are confused. Many examples might be quoted, such as Giotto, Taddeo Gaddi, and other less well-known names. Minerva the worker was the patron of all workmen in Pagan times, from Pheidias to the lowest pottery thrower, and the four workmen saints, the Quattro Coronati, in Christian times were patrons of all who worked with their hands.

The oldest of the differentiated guilds appears to be that of the painters, at least in Siena, where one was established in 1355, while in Florence they had to enrol themselves in the art of the "medici e speziali," doctors and druggists, unless they preferred to be reckoned with the goldsmiths, as many of them did. Among the painters were included designers of every sort, moulders, and workers in plaster, stucco and papier-maché, gold-beaters, tin-beaters, &c., masters and apprentices in stained glass and makers of playing cards—a most comprehensive guild. Vasari, who is, as usual, rather inaccurate, held a poor opinion of the value of intarsia, which he said "was practised chiefly by those persons who possessed more patience than skill in design." He gives Fra Giovanni of Verona the credit of improving the art "by staining the wood with various colours by means of liquors and tints boiled with penetrating oil, in order to produce light and shadow with wood of various colour," and other treatments with acids, &c., the abuse of which processes hastened the decay of many of the later examples. The first name which he gives is that of Giuliano da Majano (1432-90), the architect and sculptor, who executed as his first work the seats and presses in the Sacristy of SS. Annunziata at Florence, with Giusto and Minore, two masters in tarsia. The scheme for the decoration of the wall of the Sacristy in the Duomo, of which I show you some panels, was his—an Annunciation, flanked by two figures of prophets, Amos and Isaiah, in which the architecture plays a great part in the design, with panels of plants and vases and friezes of delicate ornament; a Nativity, bearing some resemblance to Lippino Lippi's picture in the Accademia, and a Presentation in the Temple, not without a reminiscence of Ghirlandajo's manner. He produced many works in different parts of Italy, and commenced a choir for the Duomo of Perugia, which was finished in 1491 by Domenico del Tasso, to whom the greater part of the credit must be given, since Giuliano went to Naples in 1481, and died there in 1490. They are very fine examples of the ornamental panels (two of which are here illustrated) which divide the interest of intarsia with the figure panels and the perspectives of buildings and cupboards, &c. Domenico del Tasso also did some very elaborate ornament for the benches in the Sala del Cambio, where Perugino's fine frescoes cover the wall above them; and while the character of the design shows that the attribution of the intarsia at the cathedral to him is quite correct, one must acknowledge that the craftsman's pride has led him into almost too great delicacy of manipulation. In such work as this the design has been sunk in the panel, the space filled up with the lighter wood, and

* A lecture delivered at Carpenters' Hall on March 22. Ninth of the Series on "The Arts Connected with Building."

the engraving executed last, in contradistinction to the putting together of the several bits as in the architectural panels.

The brother of Giuliano da Majano, Benedetto, assisted him in his work, and attained great mastery in the art, but gave it up in disgust, according to Vasari, on account of a *contretemps* which befel him when taking two fine chests to Matthew Corvinus, King of Hungary and a great patron of the arts. He did not unpack his chests until he was in the presence of the king, and then found to his great chagrin that the sea-damp had so perished the glue that most of the pieces of tarsia fell to the ground, and though he was able to put them together again pretty well, he gave up that kind of work in disgust, taking to carving instead.

The names of the intarsiatori were legion, and in a brief lecture of this kind it is useless to occupy time with lists of names. Some elaborate choir stalls were made by Leonardo Marti of Lucca, and are preserved in the picture gallery of that city. They show a combination of pierced tracery and inlaid ornament which is very telling, though the forms of the Gothic tracery scarcely marry with Renaissance feeling in the inlaid ornament. The panels above are the work of Ambrogio Pucci, and show the usual perspectives of architecture seen through partly opened window shutters. Here, also, is a door by one of the cloistered intarsiatori, Fra Antonio di Lunigiana, which shows a combination of views, religious subjects (in which the architecture is of much more importance than the figures) and delicate bands of ornament. At the Certosa, Pavia, are some remarkable stalls, apparently made from the designs of Borgognone by Bartolommeo Poli, surnamed della Polla, and restored in 1847 by Count Nava with coloured wax and stucco, materials which do not quite harmonise with the mellow tones of the wood. These are perhaps the finest series of figure subjects in Italy, and the arabesques below are extraordinarily graceful and flowing. At Savona, where Pope Julius II. was bishop, are some remarkably fine figure subjects which have much of the glow of colour and clever composition which one finds in Titian's pictures. The highest point reached by Florentine intarsia is perhaps the series of stalls in St. Maria Novella, made by Baccio d'Agnolo from Filippino Lippi's designs, the execution of which is as near perfection as may be. The Dukes of Urbino were great patrons of the arts, and in the great palace at that city are some wonderful doors covered with designs worked in intarsia. The study of Frederick of Montefeltro is entirely covered with this work, showing below the usual panels a bench in perspective upon which are laid musical instruments and books, and the duke's whole suit of armour as hung in a corner, while there are several figures of philosophers and learned men on other panels. The panels of the bench are represented pierced as being latticed doors of cupboards. At Gubbio, the favourite dwelling place of his son Guido Caldo, was a study decorated in the same manner: the palace is now ruinous, but one of the splendid doors may be seen in the Victoria and Albert Museum.

Several of the most celebrated of the intarsiatori were monks of the Olivetan order, a branch of the Benedictines. Of these the first master was a lay brother, who came from Tuscany in the first half of the fifteenth century and taught the art to the monks of S. Elena, Venice, the island which lies just beyond the public gardens and was so beautiful before the ironfoundry was established on it. His principal pupil was Fra Sebastiano of Rovigno, in Istria, known as the "Zoppo Schiavone," the lame Slavonian; who in his turn taught the two most celebrated of the cloistered intarsiatori, Fra Giovanni, of Verona, and Domenico Zambello, of Bergamo, known as Fra Damiano. Fra Giovanni again was master to Vincenzo dalle Vochhe and Raffaello da Brescia. Of Fra Sebastiano da Rovigno some work remains in the stalls and sacristy cupboards of S. Mark's, Venice. He also worked at St. Maria in Organo, Verona, St. Elena, Venice, Monte Oliveto Maggiore, and St. Michele in Bosco, Bologna. His pupil, Fra Giovanni, of Verona, while still a boy, left Verona and went to Monte Oliveto Maggiore, the principal monastery of the Order, and no one has been able to discover his family name nor who his father was. In 1480 he went to St. Elena, and there spoke to Fra Sebastiano about learning his art, and set about the matter with so much diligence and assiduity that he was soon able to give him valuable assistance. The work was on the sacristy cupboards and the backs of the choir stalls, and consisted of views of the principal cities of the world as they then were. He was also an excellent illuminator, and illuminated many choral books, twenty of which were preserved at Monte Oliveto in 1594. In 1502 he was summoned to Monte Oliveto to renew the choir, which consisted of fifty-two stalls, with backs, seats, arm-rests, and

all things appertaining, a work which he completed in three years. In the early years of the nineteenth century thirty-eight of these panels were moved to Siena and placed in the cathedral choir, where they now are. Another choir, made for a church near which had become ruinous, provided perspective panels to fill the gaps at Monte Oliveto, where the choir now contains forty-eight stalls. Some of the panels show the buildings as they were at the beginning of the sixteenth century. Each stall is separated from the next by a colonnette carved with delicate arabesques. In the Victoria and Albert Museum is a panel of the kind shown alternately with the views, cupboards with open doors showing objects on the shelves and a kind of grating above to let in the air. It is not so delicate in workmanship as Fra Giovanni's, but for that very reason is perhaps better for reproduction as an example of the kind of thing the intarsiatori executed with such marvellous precision and effect. In 1571 he was called to Rome by Pope Julius II., and commissioned to execute the ornamentation of the Camera della Segnatura in the Vatican, the designs for which are attributed to Raphael—seat backs, seats, and doors—and from there went on to Naples, where he did panels in the Sacristy of the Olivetan Church, now known as St. Anna dei Lombardi, of the kinds of which you have seen specimens. These are exceedingly delicate in their workmanship, and have been carefully restored. In the monks' choir of this church are other intarsie, ascribed to Angelo, Fra Giovanni's brother, principally of arabesques, but including four panels of little angels and an Annunciation. In his last years he returned to Verona, where he had made the monks' choir in St. Maria in Organo and the cupboards of the Sacristy. These have the reputation of being the best which came from his hand, and the finest of the period. The Adige was in the church for two months during one of the inundations, but the tarsie did not suffer in the way that Benedetto da Majano's did on their way to Hungary. He died in 1525, and was buried in St. Maria in Organo. Fra Raffaello da Brescia, whose name was Roberto Marone, had a Venetian mother. He went to Monte Oliveto while Fra Giovanni was there, and became his assistant, working also with him at Naples. A fine lectern from his hand is in the Galleria Tosi at Brescia. His greatest work was the fine choir of St. Michele in Bosco, Bologna, where he also made the design for the campanile. The history of this choir is a tragedy. At the time of the suppression of the convents, at the end of the eighteenth century, the populace tore the stalls down, and they were sold for a few pence to the Bolognese marine store-dealers. Only eighteen of the principal row were saved from destruction, which are now in the chapel of the Holy Sacrament in St. Petronio. The hoods and shell canopies were sold for about 2d. apiece. Fra Damiano, of Bergamo, Fra Giovanni's fellow pupil, attained, if possible, even greater reputation. He was considered the finest artist in tarsia of his time, having, "with his woods coloured to a marvel, raised the art to the rank of real painting." He passed the greater part of his life at Bologna, in the Dominican cloister there, into which he was admitted in 1528. Two years later he was commissioned to complete the choir, on the strength of seven stalls which he had produced after his admission. He carried the tinting of the wood farther than Fra Giovanni did, and is said to have had Vignola's designs for the architectural parts.

The Emperor Charles V. was in Bologna for his Coronation by Pope Clement VII., which took place on December 5, 1529. One day he was in St. Domenico admiring the works of art, and doubting that the tarsie were made of tinted wood as he was told, drew his rapier and cut a bit out of one of the panels, which has been left in the state in which he left it in memory of his act. Desiring to see how the work was done, he determined to visit Fra Damiano's studio. Accordingly, on March 7, 1530, he took with him Alfonso d'Este, Duke of Ferrara, and several princes of his escort, and went to the convent, when being conducted to Fra Damiano's poor cell he knocked at the door. The friar, having opened and allowed the Emperor to enter, shut it quickly. "Stay," said the Emperor, "that is the Duke of Ferrara who follows me." "I know him," answered Fra Damiano, "and that is why I will never let him enter my cell." "And why?" said Charles V., "have you anything of his doing to complain of then?" "Listen, your Majesty," answered the lay brother. "I had to come from Bergamo to Bologna to undertake the work of this choir. I had with me these tools which you see, few in number, but necessary for the work in which it is my study to worthily spend my life and to delight in the art. I had scarcely touched the frontiers of Ferrara when they not only obliged me, a poor friar, to pay a heavy and unjust tax, but the manner of doing it was most offensive. Now, while that

PANELS IN THE SALA DI UDIENZA, COLLEGIO DEL CAMBIO, PERUGIA.—By DOMENICO DEL TASSO.

duke allows such roguery in his State, it is right that he should not be shown this work which you see." Charles smiled, and promised to obtain from Duke Alfonso the amplest satisfaction. Going out of the cell, he told the duke the reason of Fra Damiano's anger, and he not only promised to repay the loss which he had suffered, but conceded a patent to him, by which he and his pupils were for ever free from any tax or duty when crossing the duchy of Ferrara. Then they all came laughing and joking into the cell, and Fra Damiano, to prove to them that his tarsie were not painted with a brush, took a little plane and passed it over a panel with some force, showing how the colours, after that treatment, still retained their integrity and beauty. And then he gave the Emperor a most beautiful piece of the Crucifixion, and another to the Duke of Ferrara, who valued it greatly. Locatelli gives some conversations between Fra Damiano and his assistant Zanetto, which must have preceded this visit, which are worth recording for their racy expression, according well with his reported action: "If it were in my power I would nail up this door for Charles and for all the dukes of the world. This art which I exercise is exceeding dear to me, and I hate to have to do with these signori who manage things after their own fashion; and sad it is for those who have to endure it. I respect his Majesty the Emperor, and hold him to be a great man, but the fate of Rome sticks in my throat. That other, too, who accompanies him—" "Who?" interrupted Zanetto, "the Pope?" "Oh, rubbish—the Pope! The Duke of Ferrara. With him I have a special account, and he must not come here." He also adds the detail that Fra Damiano had no money with him, and had to go about begging for wherewithal to pay the duke's dues till he blushed.

From 1530 to 1534 he worked at a great piece of panelling to be placed in the chapel of the "arca," the tomb of St. Dominic, but now in the Sacristy. This is thought by some to be his masterpiece. In it there are eight cupboards, and on each are eight subjects. In 1534 the Order was so poor that such expenses were stopped, but after seven years it was

recommenced and finished in 1550 by Fra Bernardino and Fra Antonio da Lunigiano, a few months after Fra Damiano's death, which took place on August 30, 1549. The choir consists of a double row of twenty-eight stalls on each side, 112 in all, showing on the right side subjects from the New and on the left from the Old Testaments. Those on the right side are the best, and are probably Fra Damiano's own work. The choir cost 2,809 scudi. The scudo was worth a little more than 10 francs. His reputation crossed the Alps, and Henry II. of France commissioned a little chapel from him with an altarpiece, but the work generally considered his masterpiece is the two-leaved door at the back of the choir of St. Pietro in Casinonse, Perugia. A relative of his, Francesco Zambelli, was responsible for the choir stalls in the cathedral of Genoa, and I quote the conditions of his contract with the procurators, dated April 12, 1540. He agrees to get to work not later than the first of September next, and to stay in the city till the work is done. Nor must he undertake other work under a penalty of 100 scudi, which he is to pay in such a case without demur or defence. The procurators agree to pay for every picture with its frame according to the design furnished him, and they also promise to provide lodgings for himself and his family without any expense to him, and to give him a present when the work is finished. On the same day his relative, Fra Damiano, promises to make two pictures for the seats of the Archbishop and the Doge, to be ready by Christmas next, and to be paid for at the rate of 27 scudi each, measure and design to be given by the Signory. This seems to show that the designer and executant were not one and the same, but on the same day it is recorded that it was explained to the procurators that they would have to pay the expenses of making sketches, which points the other way. Here, as is usual, the arabesques are more successful than the figure subjects. The panels with open cupboard doors are not so well done as Fra Giovanni's. That the designs were sometimes made by artists of reputation is proved by the accounts of the choir of St. Maria Maggiore, Bergamo, the masterpiece of one of Fra Damiano's assistants,

Giovanni Francesco Capo di Ferro, of Lovere, on Lake Iseo. In the archives of the "Misericordia" is a book entitled *Fabbrica Chori*, in which is noted the great expense of the designs only, among which were some made by Lorenzo Lotto, by Alessandro Bonvicino, called Il Moretto, by Andrea Previtali, and half a dozen other artists of less note, as well as the making of models and other similar operations. The total cost for labour alone was 7,000 Imperial lire. Tassi waxes enthusiastic over them, but his great praise proves that the proper limits of the art had been over-stepped in the same way as in the panels in the Colleoni chapel, which much resemble them in treatment. Thus he writes: "These, to speak the truth, for their admirable workmanship, singular art, and beautiful colouring, do not appear to be pieces of wood put together, but rather pictures formed by an excellent brush, the pieces placed with such mastery, and the woods of different colours to form the chiaroscuro so arranged with the darkening of others, that they make the half-tints appear as if really painted with oil by the same Lotto who made the coloured designs, and as he was a celebrated and finished painter and a powerful one, thus certainly these pieces of wood put together could stand in face of paintings by the most celebrated brushes, which, beyond the exactness of drawing, gave to their works singular force and finish; for in them all the possible excellences of drawing and of art are displayed, and whoever has had the opportunity of well considering them has remained surprised and delighted, never believing that human art could reach so high a pitch of perfection."

It is in Italy that the triumphs of the intarsiatori are to be most frequently met with, but the art crossed the Alps, and excellent examples occur in Germany, Holland, England, and France, where, however, it was generally the ornamental rather than the pictorial side which engaged the designers' attention, though architectural and perspective subjects are met with, and even historical compositions. Most of these are of the seventeenth century, and bear the stamp of their period. The designs for important work were generally made by painters, but, of course, at that time the crafts were not so closely specialised as they became at a later date. Cabinets, chests, and other pieces of furniture were more frequently the objects of this form of decoration than "fitments" as years went on, and the Dutch marqueteurs were very successful in the rendering of flowers, the variety of woods made available by Dutch commerce affording great variety of tint and texture. At the beginning of the seventeenth century Colbert engaged two Dutch marqueteurs for the Gobelins, and Jean Macé also learnt the craft by a long stay in Holland.

Very little important work in England is known to be certainly the production of native craftsmen, but the room from Sizergh Castle now at South Kensington may be mentioned which has inlays of holly and bog oak, and the fine suite of furniture at Hardwick Hall, made for Bess of Hardwick by English workmen who had been to Italy for some years. Correspondence passed between her and Sir John Thynne on the subject of the craftsmen employed by both, and there seems no doubt that Longleat and Hardwick were the work of the same men. The inlays upon the long table are particularly fine, and except for a certain clumsiness almost recall the glories of the great period of Italian marquetry. A few other examples are to be found, but in the eighteenth century the decoration of furniture by painting superseded inlay to a great extent.

It was in France that the greatest achievements of the later marqueteurs were produced, which have made French furniture recognised by the public as well as by connoisseurs as an art manufacture, in conjunction with the wonderfully chiselled ormolu mountings. Mention is made of intarsia in France, however, as early as 1416, though it is called marqueterie, and was probably of foreign manufacture. The first man known to have practised the art was Jean Macé of Blois, who was at work in Paris from 1644 or earlier till 1672 as sculptor and painter. He is said to have brought intarsia into France from the Netherlands. His title was "menuisier et faiseur de cabinets et tableaux en marqueterie de bois." He was lodged in the Louvre in 1644 "in honour of the long and fine practice of his art in the Low Countries." His daughter married Pierre Boulle, who in 1619 was turner and joiner to the king. An excellent example of the French design of this period (though it is many years later) is the beautiful panel signed "Follet" in the cabinet by Claude Charles Saunier in the Wallace Collection. Copper and tortoiseshell appear on French cabinets of the period of Louis XIII., and their use was probably imported from Spain or Flanders; it became fashionable about the middle of the seventeenth century, and ended by entirely absorbing the official orders of the Court of Louis XIV. With this work the

name of Boulle is indissolubly associated, though the works produced are of very varied excellence. André Charles Boulle, the third in descent, was a man of most varied talent, and in the decree of Louis XIV. by which he was appointed first art joiner to the King he is called sculptor and engraver. He was a member of the Roman Academy of St. Luke. When his workshops were burnt his collection of drawings and other works of art was valued at 60,000 livres. The number of undeniable productions from his hand is small, but objects which came from the studio after his death are tolerably plentiful, since his four sons carried on the business, though not the inspiration; contemporaries characterised them as "apes." In the Wallace Collection and at the Hotel Cluny genuine examples may be seen. His pupil, J. F. Eben, was especially a marqueteur, and after his death his widow married his foreman, J. H. Riesener, who made the beautiful bureau secretary now in the Wallace Collection for Stanislas Leczinski, King of Poland, dated 1769. He is an example of the profitable nature of his craft, and also of the tricks of fortune. Between 1775 and 1785 he received from the Garde Meuble 500,000 livres, but when he died on January 8, 1806, at the age of seventy-one, he was almost without fortune. From the middle of the eighteenth century Paris has endured a regular invasion of German craftsmen, and the Faubourg St. Antoine still has a number of German-born joiners among its workmen. Among the most celebrated of them was David Roentgen, work from whose hand may be seen at South Kensington. He returned to the old Italian method, "neither burning, nor engraving, nor darkening the shades with smoke," obtaining his effects by the use of many exotic woods. Contemporary opinion thought it difficult to imagine greater success in the particular direction in which he worked. He is another example of the freaks of fortune. His works went all over Europe, from St. Petersburg to Paris, though his workshops were at Neuwied-au-Rhein. He sold to Catherine of Russia a series of articles for 20,000 roubles, and the Empress added a present of 5,000 roubles and a gold snuff-box. The Revolution ruined him, and he was obliged to close his factory. He abandoned France at this period, and the Government, considering him as an *émigré*, seized all his effects, including the furniture made at Neuwied, then in his stores.

In preference to continuing these historical notes to modern times, I will conclude with stating what I consider to be the limitations and capabilities of the art, which will necessarily include much concerning the processes of manufacture. The anecdote of the Emperor Charles V.'s trial of Fra Damiano's tarsia panel in St. Domenico, Bologna, attests the wonderful quality of the work and its success in attaining a doubtful aim, and Barili's inscription in the panel showing himself at work, *Hoc ego antonius Barilus opus calo non penicello excusi*, shows that it was not uncommon for such panels to be supposed to be the work of the brush. The designs from which the intarsia was executed were often furnished by painters of repute, and pictures or portions of pictures were copied, a proceeding which Fra Giovanni's discovery of stains and washes of different colours made easier, until the proper limits of the art were far overpassed and its decorative quality quite lost sight of in the attempt to rival a form of art, the requirements of which were altogether different. The beautiful arabesques which the designers of the early Renaissance poured forth with exhaustless fertility, show the capabilities of the process for decorating flat surfaces, and the perspectives of cupboards and buildings were often most successful without passing the limits imposed by the material.

The question of the limits within which the craftsman's efforts should be confined in any form of art craftsmanship is a thorny one, for the attempt to overstep those limits has always had attractions for the craftsman who is master of his craft, and who sighs for fresh fields to conquer, knowing better than the outsider what are the difficulties which he has overcome successfully in any piece of work from the side of craftsmanship, though often with disastrous results when the matter is regarded from the point of view of excellence in design and purity of taste. It has been maintained by purists in modern times that all engraving or shading of the pieces of wood used in forming the design is illegitimate; and if this be so, it is equally illegitimate to stain any of them; but it is undeniable that a great addition to the resources of the art of the inlayer was made by the discoveries of Fra Giovanni, and it seems unreasonable to refuse to make any use of them because later intarsiatori abused these means of gaining effect.

The earliest work, it is true, depends mainly upon silhouette for its beauty, but does not altogether disdain lines within the main outline, and the abandonment of these inner lines, whether made by graver or saw, so reduces the possibilities of choice of subject as to restrict the designer to a sim-

plicity which is apt to become bald. A great deal may be done by choice of pieces of wood and arrangement of the direction of the lines of the grain. Some of Fra Giovanni's perspectives show very suggestive skies made in this manner, and Fra Damiano was very successful in thus suggesting the texture of much veined and coloured marble and of rocks, but directly the human figure enters into the design these expedients are felt to be insufficient and inexpressive, and inner lines have perforce to be introduced.

The opposite extreme is such work as the panels by the brothers Caniana in the Colleoni chapel at Bergamo, in which the composition and drawing of the figures recall the designs of the Caracci, and the technique of the shading reminds one of a copper plate, while the tinting and gradation of the colours take away all impression of a work in wood, substituting that of a coloured engraving. Here it is quite evident that the desire to imitate pictorial qualities has led the craftsman far away from what should have been his aim, viz., to display the qualities of the material which he was using to the best advantage, consistently with the position and purpose of his work in it. Not that perfection of workmanship is to be decried, though it is only occasionally that one is able to make use of, or indeed produce it. But the æsthetic sense demands that consideration for material and purpose in every production which the joy and pride of the craftsman in overcoming difficulties sometimes prevents him from giving. Notwithstanding the beauty of much of the marquetry of the periods of Louis XIV. and Louis XV., one often feels that design has been put on one side in the endeavour to gain a realistic effect, and the same defect may be traced more clearly in the clumsier Dutch and German productions. Even in the Italian work of an earlier date every now and then the same fault peeps out, though the excellent taste of the nation at that period prevented the Italians from falling into such excesses, and one generally feels the wood even in their most elaborate perspectives.

It may be asserted in a general way that the more colours are used the less likelihood is there of the effect being quite satisfactory, and that any light and shade introduced should be of the simplest kind. A slight darkening of the wood in parts to gain certain suggestion of roundness is quite admissible, but the expedient should be used with discretion, lavish employment of it leading to heaviness of effect and a monotony of tone which are most unpleasing. If ivory or metals are introduced the greatest care is necessary to prevent them from giving a spotty and uneven effect to the design, for neither these two materials nor mother-of-pearl marry quite with the tone of the wood; and this inequality is likely to increase with age, as the wood becomes richer and mellowed in colour. Such materials should be so used that the points where they occur may form a pattern in themselves independently of the rest of the design, so that the effect may be pleasing at first sight, before the meaning of the less prominent details is realised. Any other way of using them courts failure, since the effect of the whole design is ruined by the uncalculated prominence and inequality of these materials here and there. The Dutch sometimes made use of mother-of-pearl, in pieces upon which engraving broke up the hard glitter of the material, mingled with brass-wire and nails or studs driven into the surface of the wood. The two materials appear to be quite harmonious, and small articles decorated in this manner are effective and satisfactory. The Italian use of ivory for the decoration of musical instruments, chess and backgammon boards, and other small objects is nearly always successful, the proportion between wood and ivory being well-judged and the forms of the ornament pleasing.

The modern French marquetry, though exceedingly clever and beautiful in its use of various woods, errs by lack of consideration of the surface to be decorated, the subjects flowing over the surfaces and overflowing the proper boundaries very often; and also sins in using many woods of very slightly differing tones and textures, which will almost certainly lose their reciprocal relation in the course of time, and thereby their decorative effect. The ancient intarsias were made of a small number of different woods, and the effect was kept simple—pear, white poplar, oak, walnut, and holly almost exhaust the list; while even Roentgen's work, in which he used a large number of woods, including some of those foreign trees which Dutch commerce made available for him, has suffered from their changing and fading. I would advise the marqueteur to disregard most of the many foreign woods now in the market, and content himself with simple and well-proved effects for the most part, trusting rather to beauty of design to give distinction to his work than to variety of colour and startling effects of contrast.

It is the fashion at the present day to exhort the designer to found his design upon the study of nature, which is right

enough if accompanied by discretion and a feeling for style. In many mouths, however, the exhortation means that the simple copying of natural forms is advised, and often, if one may judge from the examples which one sees around one, without selection either of subject or form. Now it is obvious that it is sometimes the beauty of form in natural objects which attracts the eye, and sometimes the beauty or strangeness of colours, either in their combination or from the unusual tint; and while the former quality fits the object for translation into ornament, by means of simplification and repetition, the latter is more likely to be the suggestive starting-point for the production of something quite different than a factor in a directly-derived composition. Certain forms of flowers and leaves are also suitable for ornament expressed in a certain way, and when this harmony occurs the direct representation of nature is satisfactory as ornament; but the reverse is very often shown to be the case in work of a more modern type, in which the design is based on the dictum that the copying of natural forms will produce ornament. It is not the copying of natural forms, but the ordering of the spaces, the arranging and balancing of line and mass, and the adaptation of means to ends which produce satisfactory decoration, and in the best Italian intarsias founded upon freely growing, natural plants this is well shown.

In the later French marquetry we often find an equal or almost equal dexterity in expressing the natural form, and an almost greater cleverness in adapting the design to the material; but the Italian work has a fineness of style shown in a grace of arrangement and of proportioning the ornament to the space to be filled, which is unsurpassable.

A cypress chest in the Victoria and Albert Museum, made in 1350, shows a mode of decoration standing between tarsia proper and the mediæval German and French fashion of sinking the ground round the ornament and colouring it. The design is incised, the ground cleared out to a slight depth, and the internal lines of the drawing and the background spaces filled in with a black mastic, the result much resembling niello. If dark wood be substituted for the mastic background we have practically the effect of the stalls of the chapel of the Palazzo Pubblico at Siena, except that the tone of the lighter wood has not the variety which Domenico di Nicolo obtained by the slight differences of colour in the pieces used for draperies and for flesh. The effect of intarsia has also been sought by various imitative processes, some of which are almost indistinguishable from it except by close inspection, the object having been to avoid the difficulty of making the piece cut out and the piece inserted exactly the same size and shape. In one of these wax, either in its natural state or tinted with an addition of powder colour, was used; in another glue mixed with whiting or plaster, also sometimes tinted, or red-lead.

Mr. Heywood Sumner in 1902 described his mode of using the wax process before the Royal Institute of British Architects, as follows:—"First trace the design on the panel of wood to be incised; cut it, either with a V-tool or knife-blade fixed in a tool-handle; clear out the larger spaces with a small gouge, leaving tool-mark roughness in the bottoms for key; when cut, stop the suction of the wood by several coats of white, hard polish. For coloured stoppings, resin (as white as can be got), beeswax, and powdered distemper colour are the three things needful. The melted wax may be run into the incisions by means of a small funnel with handle and gas jet affixed: it is attachable to the nearest gas-burner by indiarubber tubing, so that a regulated heat can be applied to the funnel. When thus attached and heated, pieces of wax of the required inlay colour are dropped into the funnel, and soon there will be a run of melted wax dropping from the end of the funnel-spout, which is easily guided by means of the wooden handle, and thus the entire panel may be inlaid with the melted wax. Superfluous surface wax is cleared off with a broad chisel, so as to make the whole surface flush. If the polish is not applied to the wood the hot wax will enter the grain and stain it, spreading the colour and confusing the design. Incised panels may be filled successfully with japanner's gold size and powdered distemper colour, using a palette knife to distribute the slab mixture. A close grain is the one thing needful in the wood. As to design, that which is best suited may be compared to a broad sort of engraving."

Red-lead was used sometimes, and in the furniture courts at South Kensington there are several chests and other pieces of furniture which have the incised design filled in with a mixture of whiting, glue, and linseed oil. The fine bronze doors which may be seen at Salerno, Amalfi, and other places in South Italy, made at Constantinople, have figures in their panels executed somewhat in this manner, the flesh being filled in with thin silver and the drawing incised, the lines

of drapery, &c., showing a colour generally red. The sacristy cupboards at S. Maria delle Grazie, Milan, called "Lo Scaffale," show paintings by no less an artist than Luini, the ornamental part of which is intended to simulate tarsia, and from a distance does so pretty successfully, though the colour suggests some staining of the wood.

At this time of day I suppose it is very little use to gird at the mechanical modes of producing so-called artistic products, and the average purchaser is just as well pleased to possess an article the design of which in some of its details, if not in all, is to be met with in many other houses, considering the saving in cost from the mechanical reproduction of much of the work to counterbalance the frequent repetition of the design. Although in certain parts of the production of furniture or fittings the use of machinery is quite legitimate and useful, as at the same time saving labour and ensuring accuracy in the fitting of similar portions, in anything pretending to be ornament its use is unwise, for even in such things as ornamented mouldings, in which at first sight one would say that exact repetition is a virtue, it is curious to notice how all the life goes out of the ornament when produced mechanically, and in proportion as the design rises in the scale of importance so does the advisability of each example being unique. It does not offend the eye to see the Gothic ball-flower scattered lavishly along the mouldings, but directly a similar form is carved to represent a human head exact repetition becomes wearisome, the mind demands constant variety. In the same way in fine intarsia the repetition of arabesques with but slight variations of detail does not offend; but if the subject be an arrangement of flower or foliage and an exact repetition occurs, it is noted with surprise, while the perspectives and figure subjects are only pleasing when there is no repetition, each design being unique.

I have now endeavoured to set before you something of the history of intarsia and of the processes employed in its production as far as they affect design: it is this side of the matter which interests me, and I conclude with expressing the hope that I may have succeeded in interesting you also, for I am quite sure that if English artistic manufactures are to regain the place which they held not so many years ago—viz., at the head of the productions of the world—it can only be by giving that attention to appropriate and beautiful design which of late years has been replaced by the following of the will-o'-the-wisp of fashion.

YORK AND YORKSHIRE ARCHITECTURAL SOCIETY.

ON Wednesday, March 22, Mr. W. E. Barry, A.R.I.B.A., of Hull, read a paper on "Garden Suburbs" before the above Society.

He first reviewed the possible effect of the Town Planning Act in the suburbs of our large cities, and drew a contrast between what was being done on the Continent of late years, and what was being done here. Describing the general principles to be borne in mind when any garden suburb scheme is formulated, he said the natural beauties of the site, the trees, hills and hollows should be preserved, and not ruthlessly destroyed as they are in nine cases out of ten; as many roads as possible should run east and west in order to secure to each house its share of sunshine.

Avoid long, straight streets, guard against overcrowding the houses and cottages on the land; abundant open spaces to be reserved for fresh air and recreation, and generally endeavour to bring the quiet life of the country, the trees, and the colour and scent of the flowers within reach of the dweller in town.

Mr. Barry went on to describe a few of the "New Suburbs" now being formed, such as Letchworth, Hampstead, Earswick, and went fully into the detail and planning of the garden suburb at Hull, which had been laid out by him and his partner, Mr. Runtun.

The paper was illustrated by numerous lantern slides, and plans of the different suburbs mentioned by Mr. Barry were arranged in the hall for inspection.

Mr. C. H. Channon, F.R.I.B.A., proposed a vote of thanks, which was seconded by Councillor Dr. Sanderson Long, and supported by Messrs. Burleigh, Scaife and Dyer.

The next meeting will be held on April 19, when a paper will be read by Mr. Harold E. Henderson, on "The Domestic Architecture of The Yorkshire Dales."

The Leeds Education Committee have given notice of their intention to provide a public elementary school for about 150 children in Lidgett Park Road, Roundhay.

NEW SECONDARY SCHOOL, BLYTH.

A COMPETITION was recently instituted by the Governors of the Blyth Secondary School, and Mr. J. A. Gotch, F.S.A., F.R.I.B.A., was appointed assessor. There were fifty-four designs submitted, and we now illustrate the first premiated design. The chief difficulty in this competition was to provide the whole of the accommodation required for the sum stipulated, viz. 7,000*l.*, plus the 7½ per cent. margin. It was suggested in the conditions that one laboratory and the art room could be omitted to bring the estimate down to the figure mentioned. In the selected design any such omission was not considered, as the estimated cost of the scheme complete was 7,028*l.* The school is to accommodate 280 scholars (with future accommodation for 50), and will be organised in two separate departments—one for boys and one for girls—the intention being to regard the central hall, the laboratories and art room as available for both departments. Subject to this arrangement each department will be entirely independent. The manual instruction room will be outside the main building, and the school dining room and the cookery and laundry room are also outside the main building and connected to the caretaker's house. The scheme which we illustrate shows how the problem has been solved. The school building has been placed in the centre of the Plessy Road frontage, with the manual instruction room at one side, and balanced on the other by the cookery and dining rooms, both connected to the main school building by the respective playsheds, thus connecting the various buildings without providing special cover ways, and at the same time presenting a most interesting elevation to the main road. The caretaker's house has direct access from the main road, convenient for tradesmen, and is arranged so that the service to dining room can be from the kitchen or cookery room as desired.

Excellent supervision has been obtained by placing the headmaster's and headmistress's rooms on the ground floor, and the masters' and mistresses' common rooms on the first floor. The facades have been simply treated with local stock bricks, and the window heads and quoins in dark red bricks. The main cornice is of wood, and the roofs covered with green Westmoreland slates. The architect is Mr. Edward Cratney, of Wallsend and Newcastle-on-Tyne. The assessor in his report says that the hall in this plan has the advantage of not being a thoroughfare room, and that he regards the design as a pleasing and architectural group, the general disposition of the buildings and position on the site being good. The heating and ventilation have been well considered. The elevations are dignified and interesting. If the author's view that the whole could be provided for 7,028*l.* is a trifle sanguine, considering the present state of the building trade, the referee evidently does not regard it as impossible of fulfilment. There is a high average of excellence among the designs submitted, and it was only after a long and careful scrutiny that a conclusion was arrived at in regard to the award of the second and third premiums. Tenders have been obtained, and the cost of erecting the school including all outbuildings, boundary walls, &c., works out at 27*l.* 5*s.* per head.

CORNER CUPBOARD BY J. F. OEBEN.—INTARSIA BY ARMADI IN THE NEW SACRISTY OF FLORENCE CATHEDRAL.

THESE examples of intarsia work are described in the lecture on Intarsia and Wood Inlay by Mr. F. Hamilton Jackson which we report elsewhere.

DRAWINGS FOR PUGIN STUDENTSHIP.

WE reproduce some of the drawings submitted by Mr. J. B. F. Cowper, the winner of the Pugin Studentship 1911. The illustrations were photographed from the actual strainers as an illustration to our younger readers of the manner in which competitors for the Pugin arrange their drawings and sketches.

THE Committee of Visitors for the County Lunatic Asylum at Prestwich, Lancashire, require a quantity surveyor, to take out the quantities for the proposed new infirmary for female patients, in accordance with plans prepared by Mr. Thomas Chadwick, A.R.I.B.A., and to measure up the work at completion. Applications, stating terms and experience, to be sent to the Chairman of the Committee, County Asylum, Prestwich, not later than April 19.

THE ARCHITECTURAL ASSOCIATION.

AT the last ordinary general meeting of the Architectural Association on March 20, a paper was read by Mr. A. M. Brice, entitled "The Legal Authority of the Architect as an Agent." This paper was printed in part in our issue of last week. We now give a report of the remainder, together with the subsequent discussion.

Where the architect exceeds his authority, and the builder, nevertheless, complies with his unauthorised instructions, the building owner can repudiate any claim the builder may make in respect of work done in these circumstances, unless, either expressly or impliedly, he has adopted or ratified such unauthorised instructions; and the only measure of relief then open to the builder is a claim by him against the architect for damages for breach of warranty of authority. One of the principles of the law of agency is that a person, whether acting in good faith or not, who represents to a third party that he is the agent of another when he has no such authority, or represents, when authorised to act as such agent, that his authority is other than it is, warrants such authority, either expressly or impliedly, to that third party, and since his representation is untrue, is committing a breach of such warranty of authority. For such breach, or for the alternative claim, where a builder would bring an action for damages for deceit founded upon a fraudulent assertion of authority, the measure of damages would be about the same, for the measure would be in almost every case the amount which the builder has lost through acting on the faith of the architect's warranty, together with such profit as would have been made, and such expenses as he may have been put to by any action of the building owner in regard to the work done in accordance with the architect's warranty.

For example, where an architect employed to superintend the building of a church, falsely represented that he was authorised by the building owners (a committee) to order stone from a certain firm for the building of the church, and the firm, relying on the representation and believing that the architect had authority from the building owners to order the stone on their account, delivered it, and it was used in the building of the church, and subsequently failed in its action against the building owners, and had to pay the costs of the successful defendant in addition to their own, it was held that the stone merchants were entitled to recover from the architect not only the value of the stone, but also the costs they had incurred and paid in the action against the building owner (*Randell v. Trimen* (1856), 18 C. B. 786). This was an action for deceit, but an action for breach of warranty would lie, and similar damages would be awarded, even though the architect had the *bonâ fide* belief that the authority he warranted was vested in him.

On the other hand, if the builder has notice of the architect's want of authority, then his right of action against both the building owner and the architect disappears. And, at this date, when building contracts are not only almost universally used, but largely become in course of time of a stereotyped character and singularly complete, it has become increasingly difficult for a builder to say that he has had no notice of what the building owner will be responsible for, and no notice of the extent and the limitations of the architect's authority.

Before closing this paper a few words should be added with respect to the architect's capacity to delegate his authority. The old maxims—"Delegata potestas non potest delegari" and "Delegatus non potest delegare"—apply to architects as to others, but it is settled law that, in the case of architects, as indeed in the case of others too, the delegate may employ subordinates to carry out the details of his work. In *Hemming v. Hale* (1859, 7 C. B., N. S. S. 487), *Williams J.* held that, "Where a man employs an agent, relying upon his peculiar aptitude for the work entrusted to him, it is not competent to that person to delegate the trust to another, but where the act to be done is of such a nature that it is perfectly indifferent whether it is done by A or B, and the person originally entrusted remains liable to the principal by whomsoever the thing may be done, the maxim, 'Delegata potestas non potest delegari,' does not apply." And in a much more recent case, that of *Graham v. The Commissioners of Works* (*Builder*, November 15, 1902, p. 456), it was similarly held by the Court of Appeal in circumstances thus described by the Master of the Rolls:—"By the terms of the contract the architect could order the removal of any materials used in the building that appeared to him not up to the specified quality. What the architect actually did was to examine the wood on the ground, and, finding that it was not of the required quality, he directed the clerk of the works to mark the timbers already put in the roof of the sorting house to which he objected. Upon that gentle-

man's report, the architect framed his certificate, and the question was whether in these circumstances the architect could be said to have adjudicated on the matter. It was perfectly obvious as a matter of business that one could not expect an architect to go into every detail himself, and he (the Master of the Rolls) had no hesitation in holding on the authorities that the architect, having himself first ascertained that the timber being used was not of the stipulated quality, was perfectly entitled to delegate the duty of particularising which of the timbers had to be removed." And the Lords Justices concurred in this judgment.

But the architect is not entitled to put unreasonable confidence in any person to whom he may delegate his authority, even though that person be employed by the building owner; and he would be liable in damages to the building owner if, by reason of such unreasonable confidence, he should certify for work which is inferior to the quality required by the contract. For example, where a building owner employed an architect to superintend the rebuilding of a house after a fire, and also appointed and employed the clerk of the works, and the architect, accepting the view of the clerk of the works that certain timbers did not require replacing without himself inspecting such timbers, passed those timbers, it was held by *Cave J.* that the question whether new timbers were required or not was one for the architect and not for the clerk of the works, and that if the architect adopted the view of the clerk of the works without himself inspecting the timbers the responsibility of doing so attached to the architect, who became, in consequence, liable in damages to the building owner (*Lee v. Bateman* (Lord), 1893, *Times*, October 31).

To put it briefly, although the architect may delegate certain duties of a more or less ministerial character, he must not abdicate his position or lay down his responsibility as the authorised agent of the building owner.

MR. WILLIAM WOODWARD, in proposing the vote of thanks, remarked that Mr. Brice's paper had been so carefully prepared, and read in such an incisive form, that it almost made him think that his own ideas of the responsibility of an architect, his duties and his liabilities, had been altogether wrong. The question might be concentrated in this one observation—that the architect is the recognised agent of the building owner. Once that is lost sight of all the dangers foreshadowed in the paper open up. Architects have hitherto gone on the principle that as soon as the contract is signed they are as agents entitled to pledge the credit of the building owner practically to any extent, no matter whether they receive or not the consent of the client to variations in the contract. There may be variations during the construction of the building which do involve extra cost, and yet which are not expressed within the terms of the authority given to the architect. The architect acting as agent to the building owner may employ a sub-contractor to perform work by some such words as "I am authorised by Mr. —, who is the building owner, to instruct you to proceed with — at a cost of —." In order that the building owner may be protected from paying twice for the same work, architects usually make the general contractor enter into a separate contract with the sub-contractor. But in *Crittal v. London County Council* the position was that, notwithstanding that the building owner had paid the general contractor on the certificate of the architect for some specific work executed by the sub-contractor, the building owner was liable to pay once again, as the latter had not been paid by the general contractor. With regard to the implied authority for the employment of a quantity surveyor, Mr. Woodward held that assuming the client desired the competition of tenders, the client was liable for his remuneration whether or not there had been any specific agreement. There were cases where the quantity surveyor had attempted to recover his costs from the architect. In every case in which no such authority had been given the architect was liable to the quantity surveyor. In one part of the paper Mr. Brice had said that in practice appointment by written contract was the usual manner, "but in law it is only necessary in two cases to make such appointment in writing. In the first case, if the work is not to be performed within the year, or is incapable of being completely performed within the year, then, in order to satisfy the Statute of Frauds, the appointment must be in writing." This was, said Mr. Woodward, entirely new to him, and the words were very important. He would like to know whether he was right or wrong in assuming that in the absence of any specific contract between the building owner and the architect, the latter was the acknowledged agent of the owner. If this supposition was right, then the architect was authorised to pledge the credit of the employer to practically any extent in all that related to the construction of the building. If the supposition was

wrong, then all he (the speaker) could say was that he would have to take steps very different to those he had hitherto taken in order to protect his own position. The architect would have no authority to vary the building contract if he was not the agent of the owner. Mr. Woodward said his own practice had been to let the builder make a list of what he had ordered verbally within a week of ordering them, and that list when signed came within the terms of the contract. He had to confess that he sometimes did not know whether there were going to be any extras until the work with all its additions and omissions had been measured up. It should always be remembered that an architect could not delegate his authority to a clerk of works, or relieve himself from responsibility for what the clerk of works did. This had been shown in the recent "dry-rot" case, where the architect was mulcted in heavy damages for alleged negligence.

Mr. H. PHILLIPS FLETCHER said that Mr. Woodward's remarks had emphasised the difficulties architects had to contend with. With regard to the first part of the paper, the question of responsibility depended to his mind entirely on the capacity in which the architect was employed. Mr. Montefiore Brice had almost exclusively dealt with architects as the agent of the building owner. But surely it was better for the architect to be in the position of arbitrator under the contract than merely as agent. That position appeared to him to be more satisfactory to all parties concerned. With regard to *Chambers v. Goldthorpe*, it was there decided that damages were not to be obtained from the architect, because he was acting in such capacity, and was doing his best between the parties. There were some very edifying cases relating to the profession, and amongst them was that of *Dollar v. Higgs*, in which it was held that under certain circumstances a quantity surveyor was the assistant of the architect, and that the architect was entitled to two-thirds of the fees paid for such work. As to *Sharpe v. San Paulo Railway* (to which reference had been made by Mr. Brice), he believed that it was most improbable that any architect would act towards the contractor in the matter of payment for extras as the company's engineer had done. It certainly seemed very, very hard on a contractor that anyone should go back on their verbal undertaking. With regard to the cases cited relating to quantities, there was another way to look at the question, viz., from the position of the contractor. If clients did not feel themselves protected to a certain extent from extras there would be so much nervousness that they would not undertake any building at all. An ordinary client could not afford to give the architect *carte blanche* before commencing the job. Mr. Brice had mentioned that an architect had, when authorised to obtain tenders, an implied authority to engage the services of a quantity surveyor. But unless the architect discloses the name of his principal he becomes financially responsible to the quantity surveyor. Architects should be very careful not to order anything direct from a sub-contractor; as was shown in *Hobbs v. Turner*, this must always be done through the general contractor. The R.I.B.A. form of contract was to his mind some way from being perfect. If architects acted as arbitrators they must do so properly. For example, in *Carmichael v. Stonwood Flooring Co.* it was decided that an inquiry had not been properly held under the Arbitration Act. A most important case was *Trollope v. the Leicester Board of Guardians*, because through it architects might be placed in a very awkward position. In this case a man was appointed as clerk of works by the client, and then entered into a fraudulent arrangement with the builder. As a result of his lack of proper supervision, dry-rot set in, and all the floors which had been laid down had to be taken up again. Under such existing conditions, said Mr. Fletcher, it is impossible for an architect to prevent the contractor and the clerk of works putting their heads together if so minded. It seemed to him that not only the Architectural Association and the Institute, but also the Institute of Civil Engineers and the Surveyors' Institution, as trade unions, should stand together, and if necessary spend their last farthing in defending the position of their members. These professions were absolutely precarious if this decision was allowed to stand. Young architects would find it a good practice when ordering variations on the contract while inspecting the work to jot them down in their note-books, so that a formal order might be forwarded confirming the same on returning to their offices.

Mr. E. MARSLAND said that as architects they had come to the meeting for information. The paper was one that should be filed and kept within handy reference. It enabled them to see what a thorny path they had cut out for themselves as architects. Yet they need not be discouraged, for

in nine cases out of ten everything goes smoothly. An architect can generally pursue his path with equanimity if he prepares his drawings with care, and so on. In a very large number of cases the trouble has arisen because the quantity surveyor has written the specification. But that was the architect's work, and the latter would save a large amount of trouble if he wrote the specification himself.

Mr. A. T. BOLTON said a very large number of architects would save themselves trouble if they used the R.I.B.A. Form of Contract, which had become familiar to builders. He knew of one architect at least who had got into trouble through making up a form of his own. The Institute form gave a good deal of power over the building owner—a side of the question apt to be overlooked. The Institute of Builders have, moreover, approved of it. He would recommend everyone, however, to supplement it by a book of extra order forms; and he thought it a pity such a book was not issued by the Royal Institute, for that simple method gave the architect some idea where he stood. They would find that by taking a small amount of trouble at the time they were saved a lot of work later. One of the most serious questions was that of building materials. The rapid decay of materials nowadays was alarming; and there was always the question of what was reasonable perfection of material. Some materials now began to decay almost as soon as a building was completed. The vindictiveness of some clients was a thing that lawyers did not understand. There ought to be some relation between an architect's responsibility and what he received. There was also the important question of the quality of the work. Given a cantankerous client, it was possible to put an architect in a serious position by disputing that the materials were not the best.

Mr. MORGAN VEITCH (solicitor) remarked that the general public took the view that after all the client paid an architect to supervise the work and protect his interests, arguing if the architect could not devote a sufficient amount of time to his work to see to it properly then he must take the responsibility. The only safe plan seemed to be to set about a job with a determination to keep a vigilant eye on the work. It was always advisable to make sure that the client is aware of the R.I.B.A. scale of charges. The first lesson to be derived from the discussion on the paper was that it is impossible for architects to proceed without a certain amount of legal knowledge; at any rate they should have sufficient to know when a pitfall is being approached, so that they can then go to their legal advisers. A considerable use should certainly be made of the printed R.I.B.A. form; but that was not sufficient, as variations must be made. Having got the building contract drawn up and signed the architect could not be too careful about consulting it from time to time, and about making sure he protected himself if he went outside its four corners by letting the client know. Should a point of law be raised the safest plan is for the architect to offer to state a case.

Mr. E. GREENOP thought that the R.I.B.A. Form of Contract should be used only with great care and after reading up some of the cases mentioned by Mr. Brice. Whatever might be the cause there had been of late years a tendency on the part of clients to become extremely exacting and to make the architect the scapegoat not only for the builder's delinquencies, but also for the mistakes and ignorance of the client himself. Mr. Brice had stated that "the authority of an architect flows from the terms of his appointment as the agent of his employer, and in practice is generally limited (so far, at least, as the relations between the building owner and the builder are concerned) by the terms of the building contract." But the Institute Form of Contract says distinctly that the builders shall vary the contract as instructed by the architect. The whole legal difficulty arose out of the fact that lawyers will insist on applying ordinary contract law to technical questions. The case of *Robins v. Goddard* showed that architects are not arbitrators at all, but mere mouthpieces of the client. America and Canada have a most excellent description of an architect's duties and responsibilities prefacing their scale of charges.

Mr. GERALD C. HORSLEY (the Chairman), in closing the discussion, said he did not think that they as architects need be discouraged by hearing of the pains and penalties they seemed to be liable for. If they were well equipped for their work as architects, if they had obtained the confidence of their clients in the preliminary interviews with them, he thought they might rely upon a fairly safe voyage through the work undertaken. There were undoubtedly many pitfalls and difficulties on that journey, but they need not be very much afraid.

The vote of thanks was then put to the meeting and carried by acclamation.

Mr. A. M. BRICE then briefly replied to the points raised, and the meeting closed.

THE RELATION OF SCULPTURE AND CARVED ORNAMENT TO ARCHITECTURE.*

THE discussion of the relation of sculpture and carved ornament to architecture is necessarily directed mainly to that interesting series of instances where the art of form finds its fullest expression through the harmonious co-operation of both its branches: for though sculpture and architecture may each have their own definite sphere, and are in that sense independent of the other, it is when acting together in harmony that each is recognised as attaining to its highest achievements.

These periods illustrate that architecture and sculpture being phases of one art, their excellence is largely interchangeable and that when working in entire sympathy and understanding, the art of form is effectively presented, because it is then presented in its entirety.

The Egyptian, the Assyrian, the Greek, the Roman, the Gothic, the Renaissance periods are all distinguished by the presence of an adequate sculpture, in sympathy with the æsthetic theme of architecture, much in the same way as a song and its accompaniment. It is suggested that all art is one, and therefore the architect, sculptor, and painter should be united in one person.

There are so few instances, however, of this being done with success, that these instances constitute exceptions rather than rules, and judging by the amount a sculptor has positively to learn, and the difference of standpoint his phase of art demands, there is in my opinion little probability of the artist in either branch really possessing more than a smattering of knowledge in the allied arts.

The early use of sculpture would appear not to differ essentially from the present, viz., assisting to realise an object, or event, a person or an abstract idea; and it still appeals as having qualities which give it predominance as a nucleus around which the associations and memories of a person or event may congregate.

Ruskin states that to make things in real volume is a primary human instinct, and cites the case of a child making a cat and kittens in dough in support of this theory. I propose by passing in review various examples with the aid of the lantern slides to make clear the main points of the subject. The subjects of the Egyptian sculpture were historical records of the kings and their achievements, the representations of their various deities; and there are some very interesting and realistic portraits of priests and other people of importance. Most of these minor works are in wood but their treatment is similar in character to the granite work, and perhaps for this reason suggests their being thought out in granite.

The Assyrian works are much the same in subject, the records and doings of the kings, their deities, and their sports. Those depicting lion hunting are of exceptional vigour in treatment and expression, as might be expected of a sport-loving people.

Of the Greek, the sculpture was mainly devoted to the service of religion, and as the worship of beauty formed a not inconsiderable part we find this reflected in the humanising of their deities, and the effort to represent these of the highest physical development, beauty, and dignity: an effort which eventually developed that magnificent school of sculpture which is still the wonder and the admiration of the world.

Although Rome continued much the same theology, the impulse of the people being different, the real seems to have had more charm than the ideal; and we find a development of portraiture, and a careful rendering of detail: the things which are matter rather than the things which might be. We get an actual Hadrian in his statue, and it is a fine statue. We find also a development of the minor forms of sculpture; foliated ornament especially gained in importance.

Greek carved ornament was much more restrained and seems designed rather for effects of light, and of conveying through its texture, the effect of lace-like enrichment on a solid structure: while the Roman is distinguished by vigour and boldness of design, the capitals of the Pantheon which I take as typical of Roman ornament have remained the dominant type in use for palatial buildings to the present day.

* A paper read by Mr. W. S. Frith before the Society of Architects, on Thursday, March 9.

Generally, Roman sculpture conveys the impression of being used rather for its decorative value as an adjunct to luxury rather than, as in the Greek, for the love of art and delight found in seeking for its higher development. The break up of the Roman Empire coinciding with the change of faith, and that faith one in which the ancient sculpture was considered idolatrous, together with vast social disturbances, brought about the disappearance of the architecture and sculpture identified with ancient Rome. After an interval we have the rise of the Byzantine order in which while sculpture served to record one persons and the incidents of the faith, this was effected in a way rather symbolical than personal, and in architecture its principal use was to assist to produce pattern, texture and rhythm, of the general composition. The statues from Chartres Cathedral are a good instance of this, as also is the portal of Rheims, which though of later date carries on the same traditions, and as an example of design must be considered a masterpiece. This system of using sculpture affords considerable opportunity for the introduction of a variety of scales in the figures, a device not exclusively Gothic, but of which considerable use is made in all its varieties. The harmonious contrast of broad surface with broken surface, of lines with fret, and curved with straight line, while preserving the general structural idea, is one which provided the artists with material for some centuries.

The many examples the various cathedrals afford are well worthy of long and continued study, and it is the conviction of all who have been interested in the Gothic phase of the art, that it is not only what has been done that is of interest, but they feel that there is here a mine of knowledge and suggestion capable of immense future development.

The Percy Tomb is a fine example of English work under this general influence; the way in which the whole weaves together, the arrangement whereby the structural idea carries through and is borne out by the foliated and moulded enrichment, and the way in which the composition is varied and completed by the figures, together with the grand treatment of the foliated enrichment is worthy of all praise.

The revival of classic learning in Italy, and the revival of classic art which followed it, cut short the independent development of Gothic, but not without there being effort to blend the two, as in the art of Northern France, and in that called the style of Francis I.; the jubé de Limoges must be taken as a sufficient example.

With reference to the art of Italy, I think it may be said that Italian artists never took kindly to the Gothic idea of the human figure represented merely as a symbol (as it were a letter in the alphabet); but in even their early work felt and represented the strivings of the individualistic spirit within; although the work of Nicolo Pisano and his school approximated to the texture scheme of the Gothic sculptors, there is yet a feeling for form and movement which differs from these, and in the work of Ghiberti, Donatello, Verrocchio, Lucca della Robbia, Rossellino, and many more, and above all, Michel Angelo, the details become lost in the grand effort to realise to the fullest the conception of the mighty spirit moving in the divinely formed body; the work arriving at a stage when it is its emotional aspect rather than its architectural that enforces attention.

As our subject is, however, sculpture in relation to architecture, and having viewed a number of illustrations, it may be well to consider the question of general principles; for in reviewing these various works, we seem to need a guide to consecutive thought, other than that supplied by the purely historical aspect.

Yet, in approaching this, the question at once arises as to who shall define art, for the spirit of art is as intangible as a dream—may be it is a dream—of which may be said in the words of Shelley:—

"On an unimagined shore,
Under the grey beak of some promontory,
She met me in such exceeding glory
That I saw her not."—*Epipsychidion*.

Though the spirit of art is indefinable and may be considered as a vision apprehended not by any means by the eye alone, the efforts to realise this vision, which result in works of art, are found to conform to certain general rules: with reference to which in reading a musical book lately, I found a definition of the qualities a work in that form of art should possess, which seem to me to the point; it commenced by saying form, expression, feeling, and variety were essential. *Form*, the shape presented to the mind; *expression*, the prominence given to some sounds and the subordination of others; *feeling*, the character of the effect

produced; and variety, to prevent the work becoming mechanical and so lifeless. It further states a melody should display amidst all its features and phases an all-pervading unity and relationship among its several parts.

The text then proceeds in criticism of a certain arrangement, as wanting in design in its form, regularity in its expression, stability, or clearness in its feeling, and method in its variety.

These directions seem so admirably adapted to the art of the sculptor and carver, that they might well have been written expressly for him, except that being written about musical composition they make no mention of the artist's hand.

I do not suggest that the musical world in any way overlooks this, the human executant element, but that in the graphic and plastic arts it necessarily occupies a very important place indeed.

In examples from the Certosa at Pavia, I think it can be claimed that the all-pervading unity and relationship is preserved, and that the less important elements are treated with due subordination, that the varied textures and minor ornamentation are treated in an interesting and able way indicating great ability in design and very skilful execution. Much the same as to general design and importance given to some and the subordination of other portions can be said of the altar from Vicenza.

I think, however, that in the two doorways from Como we find a more marked distinction in design; the artist seems to be possessed of a more varied palette, the rhythm is felt throbbing more harmoniously throughout, and there seems more room left for the imagination to play in. And here, it may be remarked that a work may be so obviously finished, that no point arising to call for comment, we simply pass it by and are much more interested in the less complete. I think this brings us to the question of variety.

Lord Bacon in one of his essays remarks: "There is no beauty but hath some quality of strangeness in it." I think it may also be said that we do not recognise beauty in that which is altogether strange, and it is the *just proportion* of strangeness harmonised with that which is *familiar*, which constitutes the charm.

How is this charm of the familiar and the new to be obtained? By a search through the realms of nature, by developing a helpful imagination, and by acquiring the power to imitate, together with the power to invent, and to express or rather to reveal your discoveries with a skilful hand. Imitation alone is not sufficient, it must be balanced and controlled; in the Gothic period the direct imitation of leaves as in Early Decorated, soon ceased to satisfy, and developed into the more rhythmical Perpendicular.

In the Renaissance period, the most satisfactory arrangement of ornament was found to be (where direct imitation was used at all) to obtain the necessary architectural quality by a considerable dominance of conventional form, and this occurs even in the extremely free treatment of Grinling Gibbons.

The principles applying to the figure are not identical with those of ornament, but in the Greek work I think the contention that the earlier and less realistic work is the best fitted for architectural purposes can well be maintained.

And in the Gothic period the unity of the whole could not have been preserved except the sculptors' convention permitted the lights and shadows to be of the right size and shape and to occur in the right place, three things of which imitation can take no heed.

On this question of harmonistic treatment which really embraces the question of distance effect also, M. Camille Maclair writes in his work on Rodin: "This theory to which Rodin approved of my giving the name of *deliberate amplification of surfaces* is simply the critical principle of Greek sculpture, which has been entirely misunderstood by the Academic School. That school, which is supposed to honour the Greeks, is really false to their spirit, and their teaching. Moreover, this principle which belongs to all primitive statuary that was made for the open air is to be found among the Egyptian and the Assyrian. It calls in question the academic tradition, whereby exactitude is confounded with truth." This deliberate arrangement of surfaces is well borne out in the examples that have been shown this evening, and the Wellington Memorial, probably the finest monument in existence, is a further example of great care devoted to the arrangement, design, and treatment of light and shade-bearing surfaces, practically coinciding with the Rodin view.

In the Michel Angelo example it will also be found that the dominant feature is the light-bearing surface finely defined by the broad grouping and design of the shadows,

and, indeed, this may be accepted as one of the most important elements in the means of expression of the art.

This may be considered as rather appertaining to the craftsmanship; of course, craftsmanship is, after all, only the servant, something more is required in a work of art, something on which the human mind can work; for in all real art it is essential that underlying the mere representation the working of the directing mind and the touch of the executing hand should be evident. In certain work the skill of the hand is alone sufficient to justify the work; in the Roman stuccoes, for instance, how great a charm is imparted by the hand traces left upon them.

In the work of Rodin, how much does it owe to the same cause; and in the work of Michel Angelo, how do those parts so called unfinished yield traces of his consummately skilful hand moving as directed by his mighty brain? It brings the thing home to us and seems to place us in immediate touch with the artist working at those grand conceptions which for four hundred years have filled so large a space in the history and development of art; and, to use a hackneyed phrase, which expresses nevertheless a profound truth, supplies the "touch of nature that makes the whole world kin."

THE ILLUMINATING ENGINEERING SOCIETY.

THE LIGHTING OF SCHOOLS.

AT the meeting of this Society on February 16 the following paper was contributed by Mr. Bishop Harman, and read in his absence by Mr. J. S. Dow, the assistant Hon. Secretary:—

The artificial lighting of school buildings has only recently forced itself upon the attention of school authorities and lighting experts. Until quite recently, within the life of the youngest here present, the use of artificial light in school hours was a rare incident, and one that afforded not a little interest to the pupils. The occasional fog was a joke, and the lighting of the gas a thing we coveted to take a hand in, whilst the ruddy glow and the roar of the flame that spurted from the long black arm of the gaspipe made the dull old class-rooms seem jovial.

The old time, happy-go-lucky school is gone; efficiency in work and appliance, economy of time and expenditure is the order of the day. With the extraordinary improvement in school building that has marked the last thirty years, and particularly the ever extending uses of school buildings for evening classes, a demand for satisfactory artificial lighting has arisen; and the rapid advances in methods of illumination give ample opportunity for satisfying the demand. It remains for us to critically examine the necessities of the schools on the one hand and the best means of arranging our available illuminants on the other. And we must always bear in mind that at our elbow is a trio of keen critics of our efforts—the educationalist watching the light; the school keeper grumbling at the botheration of upkeep; and the ratepayer incessantly protesting at expenditure.

In the course of this paper, which is based on experimental work performed for the most part in London County Council Schools at the instance of Dr. James Kerr, I shall hope to succeed in showing you that the plan upon which any scheme of lighting must be laid out is really quite simple, and that it is the same for all kinds of illuminants, whether oil, gas, or electricity. Difficulties will arise only in so far as the actual structural conditions of rooms are irregular, or the illuminant at our disposal is lacking in flexibility.

Photometry.—One necessity of our work is a simple, accurate, and portable photometer; the methods of the laboratory, the comparison of shadows, or Bunsen's grease spot method, are not suitable for the examination of desk lighting. A photometer that has been in use in London schools for several years is that of Wingen. It consists of a metal box, 8 in. by 6.5 in. by 4 in., within which, near one end, is placed a benzine lamp, the wick of which can be raised or lowered at pleasure. Outside the box is a small shelf covered with a white card upon which falls the rays of light to be examined. Inside the box is a similar white card lighted by the benzine lamp. The two white cards are viewed simultaneously at the bottom of a tube glazed with red glass, whilst the wick of the benzine lamp is adjusted till the cards appear equally brilliantly lighted. The value of the illumination is read off by looking through a small slit in the side of the box; a mark on the glass covering this slit is taken as a "backsight," the top of the

flame as a "foresight," and the figure on the scale fixed on the side of the box beyond the flame that is found to be in a line with the "back" and "fore" sights gives the value of the illumination in metre-candles. Before commencing to work with this photometer I took it to one of the London County Council gas-testing stations, and by the courtesy of the expert in charge, and with his aid, tested the instrument against the standard pentane lamp. The instrument was found to be correct for the purpose required, and the calibration which extends from 10 to 50 metre-candles was further extended to 1 metre-candle.

If I might venture a criticism on this useful instrument, I would suggest that the principal difficulty found in its use lies in determining *what is the top of the flame* from which the measurement has to be taken. The shape of the flame varies greatly according to the extent of wick exposed; there is no difficulty when the wick is low and the flame small, but the difficulty is great when the wick is high and a long smoky flame is produced. I should greatly like to see the instrument modified in the following direction: A constant height of flame should be used, the wick should be turned up until it gives a clear smooth topped flame which shall reach a given height to be measured by sighting against marks on the near and far side of the box. Then the variation in the illumination of the white card within the box should be produced by moving the flame nearer or further from the card by a rack or pinion, and the value of the illumination would then be easily read off on a scale fixed to the rack-work. I have tried this construction in a rough model and find it works very well.

Table of results obtained with "Simplex" burner and "C" incandescent mantles, with and without shades. Figures are metre-candles.

Minimum Desk Illumination.—The possibility of distinguishing one object from another by sight depends primarily on the illumination of the object and its surroundings. A finger mark on a sheet of white paper is easily recognisable in good daylight, but not easy of recognition by candle light. The same principle holds good for distinguishing print on paper. Secondly, the power of distinguishing any given object depends upon the familiarity of the examiner with the object examined. A normal sighted person of middle age will distinguish characters on paper at a poor light with greater readiness than a small child, because the characters are more familiar to the adult. Conversely a child requires a better light to learn to read than does an adult to whom reading is second nature. A standard of illumination is no new idea. Sir Henry Halford is reported to have counselled a patient: "If you wish to reserve your eyes never read by candle light anything smaller than the ace of clubs." From a number of experiments the least possible illumination permissible on the school desk of a child has been found to be equal to ten metre-candles. This may seem a large amount of light if ten wax candles tied in a chandelier and their effect in a room is considered, but it is not large when compared with ordinary daylight in a fairly lighted room. In my consulting room at Harley Street, on a day when the sky is dull and there is not a ray of sunlight, I find the value of the light on my desk, placed fourteen feet from the windows, to equal 160 m.c.; and even at a distance of twenty-four feet the illumination was equal to thirty m.c. On this experience ten m.c. seems a most modest demand for a minimal desk illumination on each school desk.

Oil Lighting.—Except for the use of country schools oil has vanished from the class-rooms. In what are known in official educational circles as "single school areas" oil could seem to have a long life before it. And I think it will continue to be used. Lamps fitted with the central draught spreader burner are cheap to provide, simple in upkeep, and highly efficient. From a long and personal experience of these lamps in my college rooms at Cambridge, and in my private lecture-room at the same place, I am assured that these lamps will have few if any competitors in the absence of communal systems of lighting such as we enjoy in towns. I put this opinion forward in the full

knowledge of the excellence of the modern petrol gas plant and the acetylene-gas generator. In these we have most excellent systems of lighting country houses where there are attendants with reasonable leisure and skill, and an interested superman. But their application is more limited in the case of village schools, by reason of their cost of introduction and working, the necessity for skill and knowledge in working the plant; these will be beyond the pockets of the smaller communities and the ability of the village school caretaker. Moreover, village schools are better off than town schools in the matter of daylight, their buildings need not be overshadowed by houses, their fogs are fewer, their windows and walls keep cleaner, and lastly their curriculum should be arranged so that in day schools close work should cease with the failing of the natural light.

There are points in which the use of oil lamps can be amended first in the provision of better reflectors, secondly in the distribution of the lamps; both of these will be dealt with later on. Before considering the rival claims of other illuminants in the school world I should like to put in by way of parenthesis that I am not, so far as I know, in any way personally interested in any illuminating systems or companies, and that anything I may say for or against any particular mode of lighting is quite unprejudiced as it is given to a man's judgment to be.

Gas.—Most of the London County Council schools are lighted by gas burned directly as an illuminant at the jets of fishtail or batwing burners, or used as a source of heat to render Welsbach mantles incandescent. The naked jet is fast vanishing, but it is of interest to give you the comparative experiments of illuminating effects of naked gas jets and of incandescent mantles performed in an actual class-room. A convenient infant class-room hung with four points of gas was fitted first with the most approved form of naked burner, Bray's No. 4, with No. 6 regulator slipped over it. The double burner gave a steady bright flame, there was no flaring. The desk illumination was then measured and charted. Then these burners were replaced by Welsbach

FIG. 1.—The Plan of an infants' class-room with the existing lighting. A B C D, desk area. X X X X, points of light. T, Teacher.

"C" burners and mantles, with "Calypso" shades. Although the gas consumed with the Welsbach burners was no more, perhaps less, than that burned with the fishtail burners, the desk illumination was increased nearly three-fold over the whole room. The desk area measured 179 square feet. With naked jets the minimal illumination obtained over twenty-six square feet only, and then only when no obstruction, such as bodies and hands of children, came between the lights and the desks. With

FIG. 2.—The metre-candle light distribution in foregoing room. A, with naked gas jets (Bray's No. 4 with No. 6 regulator). B, with incandescent gas mantle (Welsbach "C" burner, Calypso shade).

the Welsbachs, in no part of the desk area did the illumination fall below ten m.c., whilst in most parts of the room there was an ample margin for the interference which bodies and hands make with the light. Then the incandescent light has the great advantages of purity of colour, absence of flicker, and reduction of smoke. This room in which the experiment was made is not cited as an illustration of good lighting; on the contrary, it is bad when lighted with naked gas jets since the light is insufficient, and bad with the Welsbach because the lights are badly placed.

Incandescent Gas Burners.—Granting the superiority of

MODERN EUROPEAN ARCHITECTURE.
GERMANY.[From *Moderne Bauformen*.

STREET FRONT OF VILLA AT MANNHEIM.—PROFESSOR HERMANN BILLING, ARCHITECT.

the incandescent mantle how can it best be employed in schools, in the upright or inverted form? The one sole advantage of the inverted burner is the absence of shadow below the light, and the correlated ease of securing good reflection, but I shall hope to show you that these desiderata can be quite easily obtained with the upright burner. Against the upright burner we have these counts; greater cost, more care in upkeep, greater sensitiveness to variations of pressure and vibration; and, what I deem an important point, a greater volume of products of combustion. I scarcely think it is necessary to argue these points against the inverted burner, for I hope to be able to show that the one good point of this burner can also be secured with a proper usage of the upright burner. Putting the converse I shall hope to show that the one drawback of the incandescent upright burner, the shadow beneath the burner, can be easily overcome. I may note in passing that inverted burners have been used in schools within my observation, and did not prove so satisfactory in the average school-keepers' hands.

On the particular kinds of upright burner little need be said, but I should like to put in a protest against the excessive liberality of the brass worker in loading the burner with metal; it adds to the cost of the burner (perhaps the maker does not always mind that!), and it is objectionable for another reason, we want the light as near the desk as necessary head room will permit; the waste brass work prevents this.

Shades and Reflectors.—These are most important parts of the equipment. Without a good reflector a Welsbach light is worse than a naked jet, because the brass work of the burner casts a black shadow beneath the light. By reflection from a shade the light can be so distributed as to be practically perfect. For school use the shade must needs be cheap and durable. It should reflect the light so that there is no shadow beneath the burner. It should also reflect the light so that the lamp at a given distance will efficiently cover a given area. Lastly, the shade should protect the teachers' eyes from the direct glare of an exposed mantle.

During my experiments four varieties of shade were found in use: "Squat," "Calypso," "New No. 3," and "Reflex." The inadequacy of the "Squat" as a reflector is

obvious; the sides subtend an angle of thirty to thirty-five degrees, and do not reflect light past the massive brass burner, consequently there is always a large dark blot immediately beneath the light. The "Calypso" has something of a parabolic shape, so that in its use the opaque mass of the burner is even more effective in stopping the direct downward rays. "New No. 3" differs only from the "Calypso" in the shape of the lower clear glass portion, which is immaterial. The "Reflex" is an attempt in the right direction, for the opal reflecting sides of the globe subtend practically a right angle, *i.e.*, the proper angle for downward reflection. The effect of the proper reflecting angle of the "Reflex" is evident when a sheet of white paper is held beneath the burner, for there is only a small shadow cast by the burner. But the "Reflex" is bad for school-room use for two reasons: the upper opal half of the shade ($2\frac{3}{4}$ in. vertical) is of opal glass, the lower half ($2\frac{1}{2}$ in. vertical) is clear glass. So that nearly the whole length of the incandescent mantle is exposed to the eyes of every one in the room, and rays that project laterally from the sides of the mantle are not turned downwards, but lost on the walls of the room.

In the following experiments a comparison was made of the unscreened incandescent mantle, the various shades in use in the schools, and a shade, the opal sides of which subtended an angle of ninety degrees, and the lower margin of the opal reached the lowest level of the luminous mantle. The relative values of these shades in producing effective illumination was obtained by measuring the metre-candle illumination on the desks immediately below the burner and then at intervals of a yard along the horizontal desk tops, which were five feet vertically below the burner. All the shades were examined in the same room and with the same burner and mantle and on the same evening. The results were reported on subsequent occasions. The improvement on the unreflected light by the use of any shade is great, but the results to be obtained by the use of what I will call the ninety degree shade globe are most striking. The gain is obtained by turning down rays that would otherwise be dissipated upon the upper part of the walls of the room; further there is an invaluable gain, the teacher's and children's

MODERN EUROPEAN ARCHITECTURE.
GERMANY.

GARDEN FRONT OF VILLA AT MANNHEIM.—Professor HERMANN BILLING, Architect. [From *Moderne Bauformen*.]

eyes are screened from the dazzling effect of the naked mantle. The general wall illumination of the room did not suffer, it was quite as good as when the "Squat" was used, and although not so bright as with the "Reflex," yet, owing to the absence of the dazzling effect of the exposed mantle, it appears better. The shadow beneath the burner can be estimated by the simple test of holding a large sheet of white paper below the burner. When no shade is used, a sheet of paper held a yard below the burner shows a deep shadow more than a yard in diameter; with the "Squat" or "New No. 3," deep circular shadows about two feet diameter are cast. The "Calypso" throws a small central blot with a secondary outer ring of darkness. With the ninety degree shade globe, as devised, no shade could be detected, even when the screen was held up to within a few inches of the burner. This ninety degree shade globe fulfils all the four conditions required for a school globe, and could be made without any difficulty or any material increase in cost as compared with those now in use.

Subsequent to these experiments I marked out the details of such a shade-globe, and it has been made by the Welsbach Company and proved most satisfactory. It is no larger or heavier than ordinary shades, and costs scarcely any more.

During the last year or two a compromise (on the score of cheapness) on this shade has been largely used in the schools. The sides of this shade subtend an angle of sixty-five degrees, and the opal extends to the level of the flat plain glass bottom plate. The reflection is very nearly as effective as with the ninety degree shade-globe, and there is a complete absence of shadow cast by the burner.

Pendants.—Two kinds of pendants are now in use, a "two light" and a "harp shaped." The former is the ordinary \perp shaped pendant, with a light at the extremity of each arm. The "harp shaped" is a single light pendant, formed by a perpendicular length of tube suspending an elongated elliptical shaped loop. Since all rooms are not the same size, the two-armed pendant is not fitted for general use. With a properly devised "harp shape," the lights can

be placed individually where most wanted. For such a pendant there is the usual ceiling plate, ball and socket joint, and a variable length of tubing to suit the height of the room. The loop should be triangular in shape—one side to carry the gas, the other side should be merely a support to balance the shade. The stop-cock on the gas side should be on the band, and quite clear of the bottom tube. The burner should screw clear on to the bottom tube, without any wasted room filled in with needless brasswork. Attention to these small practical points will save several inches in the distance of the lights from the desks, and improve the effective illumination materially.

Arrangement of Lights.—In this matter one of our greatest reforms can be worked. Until now it would seem that the position of the pendants in the class-rooms has been set rather with a view to symmetry than to good lighting. There is often waste of light in some parts, and poor light in other parts of the rooms. It is difficult to lay down definite rules, as each class-room has to be considered by itself. But the following four points indicate the plan upon which points of light should be set out.

(i.) Each class-room should be considered as being made up of two portions (1) the children's area; (2) the teachers' area. The lighting of these parts must be arranged independently.

(ii.) In the children's part left hand lighting must be arranged for as far as possible, exactly as in the rules for window lighting.

(iii.) In calculating the area over which the rays of a lamp will extend, we must only take into our valuation those rays which proceed from lamps in front of the class to the back of the class. Lamps in front of a class illuminate to some degree the desks of the back row, but lamps to the back of the class do not help to illuminate the front rows of desks when the children are in their places.

(iv.) There must be a clearance of six feet six inches beneath pendants, and the luminous mantle must be as closely as possible approximated to this level, hence burners must

be short and cocks or bye-pass fittings must be placed on one side of the pendant arms, and not between burner and pendant.

From suggestions (ii.) and (iii.) it will follow that the main desk lighting will be arranged to come from the left and somewhat in front of the child. The gasfitter should mark the position of the first lamp to be hung over the centre of the first dual desk on the child's left of the front row. Proceeding, lamp positions should be marked out along this front row at from six feet to nine feet intervals, according to the height of the desks from the floor; being closer in infants and further apart in the higher standards. The row of lamps thus marked out would give sufficient light for the front row and the second row of desks. A second row of lamps similarly spaced would light the third and fourth rows of desks. Since a lamp hung behind a child throws no light on the desk of that child, it follows that the space between the lamps from front to back of a room should be less than that between the lamps from side to side of the room.

In fig. 3 the plan of a model room is given to accommodate forty children. The children occupy two-thirds of the floor space and the lamps for this area may be hung so as to give efficient lighting in two ways, according as to whether infants or older scholars are to occupy the room. For infants the perpendicular distance from lamp to desk must be calculated as five feet. Three lamps will be required in

FIG. 3.

the front row and three over the front row in positions marked A.A.A. For a room with well-grown children we need only reckon four feet as the perpendicular distance from lamp to desk, and with this shortened distance the power of the lamps is improved by one-third, so that two lamps over the first and two over the third rows of desks in positions marked B.B. would be sufficient.

The illumination of the teachers' portion of the classroom must be taken separately. Here are hung maps, charts, and the blackboard. Blackboards or slates should be fixed against the wall with the right hand slightly tilted forward, as shown in sketch. They should always occupy the right hand half of the wall behind the teacher. For illumination, when daylight fails, a pendant should be hung to the left of the teacher's desk in the portion marked X; this light should be fitted with a chimney and a metal shell-shaped reflector, opaque to light, to project the light well on to the blackboard or master's desk as required, and to present a dark back to the children.

Electric Lighting.—Handiness, simplicity, and ease of distributing points of light, complete absence of shadows below the lamp, the possibility of perfect reflection, healthiness in freedom from consumption of air, and noiselessness, make lighting by the electric glow-lamp one of the most perfect means now available for school use.

(To be continued.)

OUR CONTEMPORARIES FROM OVERSEAS.

THE American Architect (New York) has illustrated a series of houses in Pennsylvania by Messrs. Mellor & Meigs, which have a refreshing note of stately simplicity. There is also a very useful series of modern schools, accompanied by detail as well as general drawings.

Arkitektur og Dekorativ Kunst (Christiania) shows us what the latest ideas of Norwegian architects in school-planning are like in a series of premiated drawings, with the report of the jury, in a competition for an elementary school at Drammen.

La Construction Moderne (Paris) has an interesting article with illustrations on the Pont Neuf, Paris, and gives also

the drawings for a boys' school at Noisy-le-Sec. Photographs are reproduced of a model showing the "restoration" of Diocletian's Palace at Spalato, executed under the direction of M. Ernest Hébrard.

Construction (Toronto) has devoted practically the whole of its latest issue to concrete; reinforced, hollow block, and artificial stone, with a discussion of its advantages and limitations as a building material, illustrated by examples of its application in Canada and the United States, amongst which are included illustrations of the Marlborough-Blenheim Hotel, Atlantic City, New Jersey, which is stated to be the largest reinforced concrete building in the world.

Het Huis (Amsterdam) includes interesting, fully-illustrated articles on Old Zutphen and Old Hoorn.

Stone (New York) has some beautiful photographs of rock-hewn temples at Petra with a descriptive article.

The Western Architect (Minneapolis) illustrates several houses by Messrs. Mellor & Meigs; the prize-winning design for the Isaac Delgado Museum of Art, New Orleans, by Messrs. Lebenbaum & Marx; the Yeon building, a skyscraper in Portland, Oregon; Episcopal Chapel, Coronado Beach, California; an apartment house in San Francisco; St. Columba's School, Newark, New Jersey; Y.W.C.A. building, Wilkesbarre, Pennsylvania; and contains also an article with many illustrations on modern English shop-fronts.

Correspondence

[The Editor will not be responsible for the opinions expressed by Correspondents.]

The King Edward National Memorial.

SIR,—Last week's issue was quite a Crystal Palace number. Two suggestions in that issue, both were excellent in their way, should be adopted. Particularly is this the case when it is remembered that our late King's father was so intimately connected with the huge building at Sydenham. It would be a crying shame that this beautiful site on Sydenham Hill should fall into the hands of the speculating builder, although some of us might stand a chance of increased work. Personally my sympathy is with Lord Tenterden's scheme, and I have contributed my mite towards it.

Apologising for trespassing on your space,—I am, yours faithfully,

NORWOOD.

Is Architecture a Trade or Profession?

SIR,—The above query perhaps sounds somewhat strangely to you, and the readers of your extensively read journal, but consideration will probably justify my raising the point. Manufacturers are faced with strange problems in this respect, and when one is frequently being worried by members of your profession to take space in a book which Mr. —, architect and surveyor, is about to issue, or is faced with "Why don't you join the — Association I am connected with?" you will, I am sure, pardon my raising the point in the columns of *The Architect*, and suggesting that the principle I adopt is the best possible in all these matters. I am setting myself firmly against such suggestions, telling my would-be friends that the small amount I can afford for the means of publicity is devoted to the columns of the architectural and building trade journals, the editors of which papers I have always found most courteous and considerate, and that did I accept their suggestion I should feel that I was offering a bribe, and should in consequence be placing myself in a *wrong position*. One or two of my fellow-manufacturers are adopting a somewhat similar position, but if the large majority would do the same I am convinced that the annoyance would soon be discontinued. With apologies for trespassing on your space,—I am, your obedient servant,

A MIDLAND MANUFACTURER.

Hollow Party Walls.

SIR,—I should be grateful if one of your readers could advise me as to the best way to deal with a hollow party wall with two inch air space in existing buildings when it is necessary to resort to "pugging" to prevent sound penetrating the party wall. Where is it best to open the wall and what is best to use as a filling material; would sand poured in till the space was filled be efficient? If one of the advertised "pugging" materials is used how should it be packed in?—Yours, &c.,

BIRMINGHAM.

NATIONAL ART TREASURES.

THE option of purchasing for the nation REMBRANDT'S painting of "The Mill" expired when less than 20,000*l.* of the 100,000*l.* demanded had been promised, and we are not particularly sorry.

In the first place the fact that the appeal made to the benevolence of the wealthy art-lovers of this country and to the patriotism of the many has fallen flat shows that Englishmen are now beginning to realise that the absurdly inflated prices for old masters which have been so skilfully engineered by the dealers are very little short of blackmail. The threat that our national art treasures, so far as they remain in private hands, will be cleared out of the country and transferred across the Atlantic unless the British public is prepared to dip its hand deeply into its pocket and outbid the *nouveaux riches*, the millionaires of the United States, of course at the same time allowing the astute dealers their fair and legitimate commission or profit, has clearly lost its power.

Even the device of allowing the picture to emerge from its comparative seclusion at Bowood into the public view at the National Gallery has failed to rouse the enthusiasm either of the art-lover or the patriot to the sufficient sacrifice of pounds, shillings and pence. Thousands of the British public have seen "The Mill," and have come to the conclusion and, we hold, a right conclusion that it is not worth 20,000*l.*, far less the half million dollars that are said to have been offered for it. This, we take it, is the meaning of the meagre response to the appeal that the British public should purchase "The Mill" for the National Gallery.

We cannot doubt that, if the nation had agreed with the estimate of its value that some unknown American is said to have formed of REMBRANDT'S great work, the money would have been forthcoming. It is quite true that there is only one painting of "The Mill" by REMBRANDT, and that anyone who wishes to buy it must pay a higher price than anyone else, but that is no more than to say that rarity is the chief qualification of the picture, as of "old masters" in general, and in this respect it is on a level with a curiosity in postage stamps or a freak in orchids.

We understand that the 17,848*l.* which was the total amount that Sir CHARLES HOLROYD had received in promises when his option of purchase for 100,000*l.* expired at midnight on Friday last, includes Lord LANSDOWNE'S own offer of 5,000*l.*, so that the estimate of the British public is that 12,848*l.* is the value as a great work of art of a picture for which they are asked 100,000*l.* This is highly satisfactory. Englishmen are prepared to buy works of art to be included in the collection of national art treasures, but they are not to be bamboozled into paying preposterous sums for rarities.

One feature of the sale of REMBRANDT'S "Mill" that

has undoubtedly weighed with the public in their decision not to subscribe for its rescue from the presumed hands of an American millionaire is the strict secrecy that has been maintained as to the name of the purchaser. All that is generally known is that the offer was made to Lord LANSDOWNE through a firm of solicitors on behalf of a client.

Recent revelations in the law courts both of this country and of the United States as to the methods and practices of dealers in antiques and old masters have excited suspicions of the *bona fides* of some of these wonderful prices that are said to have been offered, and of the existence of supposititious "clients" for whom dealers have professed to act. The market for old masters may truly be said to have received a nasty set-back from the failure of REMBRANDT'S "Mill" to attract competition for its purchase at the price named.

There is another aspect of the sale of this picture that is not unworthy of consideration, which also has acted as a deterrent to its purchase by public subscription. England is rich in old masters and other works of ancient art; America is not. Why should we desire to keep everything for ourselves and prevent the art-student and the art-lover in the newer country from reaping the advantages, educational and moral, that works of art are presumed to confer? We can spare a few hundred more pictures and still remain well endowed. Not alone in our museums but in the great country houses of the land—like Bowood—there is an almost unrealised wealth of beautiful things that are not seen by ourselves to anything like the extent that they would be by others if transferred to the States, and therefore fail to impart to the world the pleasure or the instruction of which they are capable. How few rich Americans there are who, like Mr. PIERPONT MORGAN, can stand on an equality with scores of English noblemen and gentry in the possession of art treasures. Therefore we can scarcely feel just resentment if Lord LANSDOWNE or anyone else parts with some item of his personal property that we may reasonably consider as amongst our national art treasures.

When we are thinking of these treasures and of the easy terms on which they have been purchased as compared with those sums that America has to pay in the present day, we should not forget the great work that has been done by the late Sir CASPAR PURDON CLARKE in placing our own Victoria and Albert Museum in the high position that it now occupies as a storehouse of art. His judgment and acumen in acquiring for the nation specimens of artistic handicraft for sums that in the present state of the market are ridiculously small has made his memory one that should ever remain green in the hearts of all lovers and students of artistic crafts. To him and to the ancestors of Lord LANSDOWNE and others of our nobility and gentry we owe to-day the astounding wealth of our national art treasures.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

THE drawings sent in for March show some useful and informative studies of Renaissance windows, all with one exception of English work. Thorough and careful measurement of such subjects are worth far more as education to a student than pretty freehand sketches. They need not be often repeated, as the lessons they teach, once learnt, remain part of the mental equipment and training, even though they may have become subconscious.

Mr. T. OWEN THIRTLE has made thorough and careful studies of two double-hung sash windows from Churchman's House, St. Giles's Street, Norwich, which, he tells us, are of the date 1725-1740. These simple yet effective instances of eighteenth-century work, with their shutters and other woodwork, are just the sort of thing that will be useful to Mr. THIRTLE when he comes to design an everyday double-hung sash window for a modern client.

"Lot" has measured and drawn a window from the Old Ashmolean Museum, Oxford, the date of which is 1682, and which is a very fine example of an ornately-treated window. The general drawings are to three-quarter inch scale and the details full size and half full size. The latter is not a good scale to which to draw detail, as it is apt to convey a false impression. If the subject is too large for full-size drawing, which is best, it is advisable to use either one-quarter or one-third.

"Finestra" sends the only foreign example, a window from the Palazzo Comunale, Bologna, which was an insertion by SERLIO in an earlier building. This is a good specimen and well drawn to half-inch scale with full-size mouldings.

"Sans Peur" contributes two windows from the front elevation of Gosforth House, Northumberland, one of which is semi-circular-headed with Ionic columns carrying the arch, the other square-headed with a segmental pediment on consoles. These we are told are the design of JAMES PAINE, date 1757, and are interesting examples. The drawings, which are to inch scale with details full size and quarter full size, are rather rough in execution, apparently from haste.

Mr. E. H. GIBSON illustrates a window from Holy Trinity Church, Leeds, date 1721-1727, and in addition to the measured drawings sends also a plan and sketches of the church. The scale of the measured work is suitable, inch and full size, but Mr. GIBSON needs to study sciography more thoroughly, as his projections of shadows are not correct, according to the usual convention, which should always be observed. Sciography is not primarily a device for making drawings look nice, but is intended to convey definite information of the projection of things drawn in elevation.

"L'Quayt" sends measured drawings of a window from Harewood House, Yorkshire, designed by JOHN CARR of York, and drawn to inch scale with full size details. This is a good example of refined eighteenth-century masonry.

We award the prize for March equally between "Lot" and "Finestra," nearest to whom in merit come Mr. T. OWEN THIRTLE and "L'Quayt."

NOTES AND COMMENTS.

WE learn from Sir ISIDORE SPIELMANN's letter to the *Times*, announcing that the British Section of the International Fine Arts Exhibition at Rome was opened by the King of ITALY on March 28, that Mr. FRANK SHORT, R.A., P.R.E., arranged the hanging of the architectural drawings, as well as the works in black and white. Sir ISIDORE does mention the names of Mr. ERNEST GEORGE, A.R.A., and Mr. HIPPOLYTE BLANC, R.S.A., as having "contributed to the success of the Section," which success, we take it from the whole scope of his exultation, may, as the planning of the building foreshadowed, be rightly esti-

mated as the triumph of painting over all other forms of British Art.

THE chief architectural interest in the *Art Journal* for this month lies in a review of "Highways and Byways in Buckinghamshire," by Mr. CLEMENT SHORTER, some of the sketches of buildings in which, by Mr. F. L. GRIGGS, are reproduced. In an article on Captain AUDLEY HARVEY's collection of pictures, which is remarkable for its excellent examples of modern painting, are reproduced instances of the presentment of architecture in *Le Pont Rouge, Albi*, by OLIVER HALL, R.E., and *L'Evêché de Chartres*, by HENRI LE SIDANER. The series of articles on "The Glamour of Landscape," by C. LEWIS HIND, is continued with examples of fifteenth-century Italian and Flemish painters.

In the *Connoisseur* for this month are illustrated some fine examples of eighteenth-century French—or Franco-German—furniture from the collection of Sir JOHN MURRAY SCOTT, in the Rue Lafitte, Paris. An interesting article on "Rings: Ancient and Modern," by RHODE KNIGHT, illustrates several curious and some beautiful examples of this branch of the jeweller's craft.

Mr. GEORGE BAILEY continues in the *Antiquary* his articles "On some curious carvings found in old churches," with sketches of two misericords from Wellingborough.

In connection with the Edinburgh Town-Planning Exhibition lectures have been given on various subjects connected with the betterment of towns. Amongst these was one by Mr. WILLIAM DAVIDSON on "Colour in Street Architecture," which seems to us to have struck a true note. Mr. DAVIDSON dealt with the question of the effect of sunlight on colour, and maintained that colour was more beautiful and effective in a grey light, and that strong sunlight destroyed all local colour. In dealing with building stones, he advocated a wiser selection of colour where two colours of stone were used, and referred to the great possibilities where two colours were used in grouped bands of colour. He maintained that red stone of a strong colour was unsuitable for monumental work, and was best used in isolated or semi-isolated situations. Mr. DAVIDSON did not advocate a wholesale use of colour in main streets, but suggested the use of small masses of colour in tympanums, over doors, shields, heraldry, as was so successfully done in Renaissance times in Italy, and advised that greater care might be taken with the use of colour in shop signs and external woodwork and applied colour.

Now that the proposal to put London's King EDWARD Memorial in St. James's Park has been abandoned, it would be a favourable opportunity to unite the scheme for a grand statue with Lord TENTERDEN's project for a National Memorial by the dedication of the Crystal Palace and its curtilage to the public. There is here ample space for a memorial statue as well as a permanent benefit for not only Londoners, but all Britons who visit London. The attempt to save the Crystal Palace is worthy of support for its own sake, even more than for its suitability for a memorial to King EDWARD, and we hope to see the requisite support speedily accorded to Lord TENTERDEN and his coadjutors.

THE promoters of the scheme for laying bare the foundations and investigating St. Robert's Priory and church at Knaresborough, as a memorial to the late King, have approached King George, with the object of securing his patronage. His Majesty, however, cannot comply with the request owing to the number of similar applications at present being received.

THE DECORATIVE USES OF SCULPTURE.*

(Official Report.)

By Professor W. R. COLTON, A.R.A.

PROFESSOR COLTON said that the subject of his lecture as announced on the programme was not quite on the same lines as he intended to take, but as it was not a very serious discrepancy he did not suppose it would matter very much. The subject of decorative sculpture, both ancient and modern, or as the programme of the lecture had it, the decorative uses of sculpture, was so full of interest to him and so mixed up with architectural, historical, and other questions that he hoped they would excuse him if he somewhat ran off the regulation lines, as it were, and got "side-tracked" a little in speaking of some of the branch subjects,

THE WAVELET.—By W. R. COLTON, A.R.A.

which he was sure would be of equal interest, at any rate as far as he was concerned. First of all he rather wanted to beg the question by saying that sculpture was decorative according to its quality and style—that was, the scale of its execution and its style was naturally what the author of the sculpture wished to say, what he had in his mind, in working at a particular sculpture or group, whatever it might be. As they knew, the Greeks generally went for dignity and a calmness in their statuary—they wished it to be calm and dignified and without any theatrical nature about it. The Egyptians went for the awe and intensity of expression of their religious feeling in their statuary, while in the Christian school it was rather an expression of sacrifice and terror, as it were, and in addition they expressed more simple things, such as love, grace, &c., which were all fine subjects for sculpture. In his opinion, the domestic was never a really good subject for statuary, and it was hardly allowable for fine sculpture. For instance, he did not think that a child and a puppy could be said to combine well as sculpture. Of course, no meaning behind the work was decidedly bad sculpture,

just as architecture without meaning was bad architecture.

That brought him to rather a serious point because, in his opinion, in the wonderfully impressive buildings of Greenwich and St. Paul's Cathedral they found the germs, as it were, of much of what he ventured to term the hardly logical architecture of to-day. They all knew the pediment, for instance, was the gable ends of a house or building; the dentils were the ends of the rafters, and that the arch was constructed to take a great weight above it. Many of those things, however, had become useless from the constructional point of view, and while it was true that some were allowable because they had become a form of conventional ornament in that particular class of architecture, he did think they must draw the line somewhere—they must be logical in their architecture, or else they were going in the wrong direction—a very wrong direction indeed. He dare say they had all noticed that architecture was becoming of late rather mad, illogical and senseless in some of its points. He had spoken of the arch which supported the superimposed mass—or which should do so, but which was now ordinarily used as a feature on the face of the building with no weight above it. Then there was another feature—the lintel, which was the construction above the window or door space, which was supposed logically to take the whole weight of the building above it, and the essential point of the lintel was that it should be absolutely constructional. If, however, they were to go about London and look at even some of the finest buildings they would see that it was quite a common thing to break the lintel with one or even more keystones. This was becoming quite a common thing, and it certainly was not logical. He considered this really bad architecture, and could not imagine what excuse there could be for going against the whole principle of construction. But some people were not even content with a row of keystones along the whole length of the lintel, but placed one, two or three keystones on top of the centre one. Without further enlarging on that he would only point out that it did not seem to him really the right lines to go upon. Of course, in St. Paul's Cathedral they would find one or two of these points slightly emphasised—it was the commencement of the germ, as it were; but St. Paul's was such a beautiful building and he was such an admirer of it that he personally considered them as mere ornaments. In the exaggerated modern arrangement they ceased to be reasonable at all. Mr. Colton next showed some photographs of St. Paul's Cathedral and pointed out the pediments over the windows, which he said had become the ordinary ornamentation of the window and served the intended purpose of protecting windows from the rain. In the case of St. Paul's, however, the windows were already protected by the cornices above. The beauty of the placing of the sculpture on St. Paul's was, it seemed to him, very great—it enhanced the value of the building, and there was no error of taste which was so often seen in the placing of sculpture in modern buildings.

The original pediment was the gable end. The Greek pediments were generally decorated with figures; and those figures were some of the most beautiful which we and other nations possessed. The figures in the pediments were, of course, a long way from the eye, but they lost none of their beauty from being highly wrought. A Greek never failed to make his figures highly wrought. The backs of the figures were as beautifully finished as the front. The Greek architect never for a moment thought that any power was lost by such finish. Nowadays we were inclined to think that we lost power by the beautiful finish of the figure if it was to be placed some distance from the eye. Mr. Colton exhibited a photograph of the "Three Fates," and said that these figures together with the Elgin marbles of the Parthenon frieze were never really seen until they were brought to the British Museum. Several of the figures from the Parthenon frieze were thrown on the screen to show the wonderful finish given them by the Greek sculptors notwithstanding the fact that they were placed in positions far away from the eye. He dare say that many of the audience after climbing up some tower had been astonished to find themselves amongst roughly chipped blocks which hardly represented figures at all. That was the modern idea of how sculpture should be done for architectural purposes, but the Greeks never thought that. The Greek artists must have always thought of the time when these pieces of sculpture should be dug up and placed in a museum. They were infinitely precious to us, and it would be seen that even the foot of one of the figures was a thing of beauty and delight. They could not say that of any sculpture which had been done in modern times for architectural purposes.

* A lecture delivered at Carpenters' Hall on March 29. Tenth and last of the Series on "The Arts Connected with Building."

Of course the conditions had changed since Greek days. They must not forget that time was not then so important; perhaps money was not so important—there was not such a cry for motor cars instead of sculpture, and emperors and rich people were more prepared to pay for real, thorough first-class work. Then again there was the question of time. Nowadays people would not wait for the work to be done. If a few years were taken over a great memorial the sculptor was grumbled at, and, of course, the finest work in sculpture could never be done under those conditions. Good work must take time and it must cost money; there was no getting away from those two facts. Nowadays the higher sculpture was placed the cheaper it was supposed to be, and therefore the rougher it must become. The lecturer next showed another part of the Parthenon frieze at the British Museum which was placed fairly high with a big projecting cornice beneath it, and he said that the width of the Parthenon was never sufficient for that relief ever to have been seen properly by the Greeks and yet it was the most superbly rendered relief frieze that one could imagine. It was most subtly and beautifully modelled—in fact it was one of the masterpieces of the world, and if any of his audience had not seen it he advised them to go to the British Museum and look at it.

It was supposed by archæologists and antiquaries that this frieze was coloured. But, while it might have been coloured at some time—perhaps by some emperor who loved colour and thought his temple was not sufficiently effective—he was quite certain it was never coloured by the sculptor himself or with his permission. Colour on a subtly rendered surface of that sort would be absolute vandalism—the years of labour it must have taken to have wrought that work would have been spoiled and obliterated by the use of colour upon it, and therefore he thought there was not the slightest doubt whatever that the colouring of that frieze must have been done at some later period. Of course, colour had its advantages—a thick pigment was effective from a distance and was naturally welcomed by the worst sculptors because it covered a multitude of sins. The sculptor might have preserved his work by washing it with some transparent fluid, but if they ruined a thing in preserving it he did not quite see the advantages of it. At any rate colour on sculpture certainly acknowledged that the highest results had not been obtained. They knew that colour was used on certain sculpture by the Greeks and Assyrians and Egyptians, and they also used coloured materials, but not, he thought, on their finest works. They found the great statues in the temples such as Minerva and Jupiter by Phidias were made of coloured material; the eyes and the face and the drapery were coloured, but these were rather different to other sculpture. These figures were really gods and goddesses, and were not sculpture in the ordinary sense. They were no part of the architecture of the temple, but they were the presiding and colossal deities of the temple, and were coloured simply to impress the common people. A coloured figure was more impressive and was more thoroughly understood by the commonplace mind, as they could well imagine—these deities possessed the temple as it were and these figures were coloured so as to strike awe and terror into the beholders. They were so colossal that colour had little effect on the subtleties of their modelling. They were larger planes and the modelling was not so delicate, and the effect was from a different point of view, *i.e.* from the religious rather than from the artistic point of view. There was a note on colour which he would like to read to them which was given by a Professor of Sculpture at the Royal Academy many, many years ago—one of his predecessors. He said: "The absence of colour in a statue (there, of course, was meant polychromatic colour) is in short one of the peculiarities that removes it entirely from common nature so that the most vulgarly constituted mind might contemplate it without it causing any feeling of a sensuous kind. The eye learns to look upon it not as a real existence but as a sort of visible representation of some admirably concentrated essence that excites our admiration or calls forth our imitation, and it must have been a sentiment of this kind that caused the gradual disuse of colour in the old times, as well perhaps as the occasional use of it when the arts were subservient to rules of a less refined taste. These objections to the use of colour could apply less to colossal works, whose magnitude in themselves relieves them from all proximity to everyday life, and again the smaller works where the variation from the natural size permits a too near approach to reality. We have still with us those who desire to work in delightful coloured material and the opposing school that feels the finest workmanship, particularly in the modelling of bare flesh, cannot possibly be seen

in a highly coloured material, more especially if that colour is polychromatic."

The "Belvedere Torso" was one of the greatest works in the world, and was supposed to be the foundation upon which Michel Angelo founded himself. In the work of Michel Angelo they would see a great difference from the work of the more primitive Greeks. The Greeks had very simple tastes and very simple ideas, and their sculptors crystallised these ideas into very definite forms. Pericles was the man who inspired the great sculpture of Greece, although it was supposed to be Phidias, yet Pericles was the man with the moving mind of Greece. No doubt he got other architects and sculptors around him, and his spirit entered into them. He did not think there was any other explanation of that wonderful time in Greece than that Pericles was the man who was the motive power of all the fine work. Of course, the architects and artists were great, but still behind it all there was the moving spirit of the master mind, and that man he thought was Pericles. Michel Angelo was brought up in a different school—a different religion had come into being; the Gothic, as it were, was grafted upon the Greek, and he wished to portray the very strenuous feelings of religious mystery which had then arrived, and which had been growing ever since the Greek times. Michel Angelo

TOMB OF GIULIANO MEDICI, FLORENCE.

wished to portray much more behind what he did—he was the great moving spirit, but, apart from that, he seemed to have founded himself upon this torso as far as the wonderful movement of the construction, the light and shade rippling over the muscles, and the different planes of the various parts of the body. Mr. Colton proceeded to show some sculptured figures by Michel Angelo on tombs, and pointed out how similar the feeling was to that expressed in the "Belvedere Torso." Instead of the rather severe type of the Classic school of sculpture they saw a tremendous effort of meaning behind the figures. The figure of Giuliano de' Medici over his tomb in the Medici Chapel, Florence, was full of mystery, and was evidently the work of a man of thought, and who wanted to convey a sense of the power of the mind. Again, the reclining figure below it of a woman representing Night gave one the idea of a woman worn out with intense toil, and was tremendously impressive—the mother of probably many children worn out with fatigue and thought, and that was what Michel Angelo always wished to impress. There was an immense feeling at the back of all his work. He was not so particular about his proportions—perhaps he was disproportionate, but in his disproportions he tried to impress one with his own thoughts and feelings.

In the group "Christ and the Madonna" he said the disproportion of the figures could be particularly observed. Christ was a grown man lying on the lap of His mother, who was very much bigger in proportion than Christ. The sculptor thought it was allowable to make the figure of the mother much bigger than the figure of the grown man Christ, in order that he might convey the meaning of motherhood, that she was the mother and He was still the child. Michel Angelo was an architect as well as a sculptor; he was more or less responsible, at any rate, for the dome of St. Peter's, if not for the whole of it. There was a curious feature about the figures on the Medici tomb which he did not quite understand. It was quite obvious that the pediment of the sarcophagus was much too small for the figures—these had an unpleasant "sliding off" effect, and the architectural part seemed to be much too small. It was a curious thing, but they would find drawings in the British Museum and in Paris where these parts were not made nearly so small as they really were, and why Michel Angelo should have departed from those drawings it was difficult to say. It was not known whether somebody else took them in hand and altered them, but, at any rate, in the drawings the architectural portions were made much bigger, and the figures did not appear to be sliding off.

Mr. Colton next showed a photograph of a Cupid of Michel Angelo, which, he said, if it were anywhere abroad would attract great numbers of pilgrims, but as it was only a few steps out of Piccadilly nobody went to see it. It was worth untold gold, and was quite free for anybody to see. It was in the Diploma Gallery of the Royal Academy, but he was afraid that very few people took advantage of the opportunity. Attention should be paid to the unfinished portions, which were a very common feature in Michel Angelo's works. As he had remarked, Michel Angelo began to get disproportionate in his limbs and also in his figures—he was rather inclined to think that disproportion was more emphatic in certain ways, and emphasised what he wanted to portray, and here they began to see the unfinished work which he left. He did not leave it intentionally, but Michel Angelo was an architect, and he used sometimes to go for a year or two at a time to the marble quarries and quarry the marble himself. That, of course, took up a great deal of his time, and there was not time for him to finish completely the great amount of work he was engaged upon. He wanted to emphasise that point, because it led up to a great deal of what was going on in modern statuary at the present day.

Rodin was perhaps the greatest artist and sculptor in France. He was a great artist who had thought and mind behind him, but still in spite of all that he was a very dangerous instructor indeed for the coming sculptor. Although he tentatively founded himself upon Greek sculpture, he had in reality founded himself entirely upon Michel Angelo. He finished his work less than Michel Angelo, but where Michel Angelo accidentally left work unfinished, Rodin did it intentionally. The danger of this practice, with its malformations and disproportions, was that the fine ideals and conventions of the Classic art would be displaced. The post-Impressionist pictures shown at the Grafton Gallery were all of the same movement—the movement of eccentricity, of attempting to portray something which was hardly capable of being portrayed, with the result that the beautiful, fine, dignified Classic art was displaced in favour of the eccentricities of the day.

A curious thing that was happening in England in this regard was the mutilation of statues. This school, which had been formed in Europe for some time, had now formed itself into a school for the mutilation of sculpture, and England had been so influenced that at an ordinary exhibition of sculpture in London he had seen a large proportion of the works mutilated. It had been discovered by a certain school that to lop off a leg or two legs, perhaps an arm, or two arms and a head greatly enhanced the value of artistic production. At any rate, it left more to the imagination—like the painter of a battle picture who in order to save painting in more soldiers put in a tremendous amount of smoke. Some genius of this type had gone even a step further and split off a fragment of a face for exhibition, while another one had a crown without a head. He remembered that at the particular exhibition he had in his mind there was a most curious and pathetic female figure which had the appearance of having been caught sitting on a railway line. She had suffered amputation of both legs at a most unfortunate section, so that as one looked at her they saw the torso upright and two round holes which cut the legs completely off. And that was supposed to be a great work of art. He quite understood how the sculptor felt in the matter. It was so much easier

to do a portion of a figure than a complete one, and it was also just as valuable if they could do a whole figure and cut off the head and call it one work of art and to think of the torso as another; it saved time. Although they might joke about it he felt very seriously in the matter, and he wondered how long it would be before the public got to see that this mutilation of sculpture was a very grave thing. Then there was the chaotic school.

It was to be hoped that we should not have any sort of eccentricity in connection with the new St. Paul's Bridge, which would afford a chance which might never occur again of doing something very beautiful in the City. He could imagine the approaches having very beautiful groups and being made really a fine thing. Whichever direction the bridge took, the buildings could be cleared away in such a manner round St. Paul's Cathedral that it would immensely enhance the value of the view about that neighbourhood. Sculpture could be put upon the entrances of the bridge, and it could be made most decorative and artistic. As the chance might never occur again he hoped that whatever was done would be done in the finest possible way. Of course, utility was something, but beauty was also something—we must never forget that utility was not everything, but that there was a beauty of the mind and the soul which we had to consider as well as the mere ease of communication.

A very charming bridge (although the sculpture was not particularly good) was the Pont Alexandre III. in Paris, which was built for the last exhibition. Its piers and sculpture were really very fine and made one think that it was that which they required in decoration. They wanted decoration to make one think, or dream and build castles in Spain, and to take one's mind away from the sordid idea of merely money-making. Decorative sculpture caused one to feel that after all the mere aim of life was not the getting or the spending of so many hundreds or thousands of pounds, but that there was something nobler—the making of a fine, beautiful thing which would last for ever.

England was a land of good intentions—and they knew where the pavement of good intentions led to. All over England were to be seen plinths, pedestals, niches—they were to be seen everywhere in cathedrals and Government buildings, with nothing on them. The other day he was passing along Hyde Park Corner and saw the Constitutional Arch where a great group of sculpture was going to be placed. He looked at the arch and was wondering when the authorities were going to put the sculpture upon it, when to his surprise he saw smoke arising. He thought that could not be a pedestal for sculpture—it was evidently a chimney pot. They would have to make some constructional alterations in that pedestal before they put sculpture upon it, or else we should be blaming the English climate for the sootiness. We had these good intentions in England; we started buildings with niches to be filled, but the sculpture never came. We always felt that we had finished when we had provided the kitchen and the lavatory accommodation—we did not think of the beauty of the soul and what was necessary for it. We had recently built a processional arch under which monarchs of all countries would pass, but we were not satisfied with making simply a beautiful arch—we must make it a residence for some

Government official at the same time. One could imagine the kitchenmaids hanging out of the top storey and watching the kings pass by. Personally he could not see either the logic or the sense of such a proceeding. It appeals to some officials; they feel that if in putting up a statue to fame or immortality a kitchen is made in the interior then they have scored and gone one better than the artist. Moreover, they get a slight return for their money, which is the great thing in England. Nothing for beauty's sake alone seemed to suffice. Here in England we always wanted to graft the useful upon the beautiful and decorative instead of trying to make the useful beautiful.

The refining influence of beauty upon the human mind was tremendous. The governing powers did not realise that half the gross vices of mankind would be cast aside if the mind was properly brought under the influences of beauty at an early age. They never realised for a moment that that was one of the educational factors. In our educational departments in art we taught many hundreds and thousands of the pupils preliminary drawing and so on, but we did not surround them with beautiful objects, nor did we teach them to appreciate the beautiful such as was to be found in landscapes, sunsets, architecture, and sculpture. If the people were to be taught to appreciate those things they must be brought near to the common person, not only in the West End but in the East End. They must bring beautiful sculpture close to everybody; they must decorate their Board schools and make them beautiful in some way so as to surround children from the very beginning with refining influences, and he was sure that it would pay them over and over again to cultivate the human mind in that way. Why should not the playgrounds of our schools be made into something of a garden? Why should not bronze fountains (perhaps the most beautiful thing in sculpture) be placed in school playgrounds? It might be said that the children would smash

some of them. There were two qualities about a memorial which he imagined were inherent. A memorial to be a memorial must be a visible thing; also it must justify itself—it must be a love-offering, a sacrifice to the dead, free of any hidden or obvious benefit to the giver. If one gave a loved one a gift, they did not give something that the giver could use himself or which would be any advantage to him; and

FROM THE ALBERT MEMORIAL, LONDON.

By H. H. ARMSTEAD, R.A.

therefore he thought that a memorial to a beloved Sovereign or great man should be absolutely a sacrifice to the dead, a free gift. When Prince Albert died a great many schemes were mooted for memorials. Some of them seemed very curious, in fact very humorous, and more like a Gilbert and Sullivan opera. One town for many years had wanted a new drainage scheme, and some people conceived the brilliant idea upon the death of Prince Albert of raising money either by the rates or voluntarily for a scheme to be called the Prince Albert Memorial Sewer. That was an example of the very worst form of memorial.

In London we had done very well in regard to the memorial scheme to the late King, but all over the country there had been a tremendous number of suggestions, many of which appeared to him as a sculptor to be very funny indeed. The first suggestion that so struck him was that Nelson should be dislodged from his pinnacle of fame and a statue of King Edward placed on the top of the column. He did not know what it was proposed to do with Nelson; but, at any rate, they were going to change the name of the Square. When he heard of that suggestion he wondered whether the battle of Trafalgar had become any less important now than it was at the time it was fought. It seemed to him that England would never have occupied the position she now did if that battle had not been fought, and it was just because it was well that England should always remember Trafalgar that that monument was justified. His point was that if a man had done anything great in his lifetime, any memorial that was erected should be of such a nature that it reminded people of the dead, and anything which did not lend itself to that was not suitable for a memorial. Coming nearer home, he saw in a newspaper—he did not know whether it was true—that the exterior and interior of the Mansion House should be done up as a memorial to King Edward. If that suggestion was really made, it was certainly a case of those who wanted to give their cake away and eat it too. Then there was a suggestion that the façade of Buckingham Palace should be repaired. That would be in a sense a memorial to King George as having been done in his reign. But that was a neglected duty of the State. Buckingham Palace was one of the worst palaces in Europe, but he failed to see that there could be any connection between repairing that Palace and a King Edward memorial. Another suggestion was a great crusade against consumption, and there were several hospitals which had schemes—all excellent in their way, but which could in no way be considered a memorial to any one man; and as the hospitals would eventually be taken over by the State, they would then lose their individuality. Memorials such as those could not in any way make our descendants realise the features and attributes of King Edward. Hundreds of clock towers were to be erected in different towns in England—a form of memorial which, to his mind, was utilitarian in the extreme and most inartistic. One scheme was that the animals at the Zoo should walk over to the Crystal Palace—perhaps some people could see the connection between that and a memorial to King Edward,

FOUNTAIN WITH BRONZE BACCO, FLORENCE.

them. He admitted that for a time they might, but later on they would learn to appreciate them, and would be only too anxious to have them. The mere fact that at the present day the public would break up such things proved that they had never been taught to appreciate them—they had never been brought under the influence of the beautiful in the world which would make them love it; and, therefore, when they saw anything beautiful they were inclined to break it up.

It was advisable to comment on some of the proposals for memorials to commemorate the late King Edward, for he thought that we were going very much astray in regard to

but he (Mr. Colton) could not. Another suggestion was that the Crystal Palace should be financed and set on its legs. In his view, the Crystal Palace was good enough for a temporary exhibition building, but it afforded an example of the gross misuse of material. He did not know whether he was libelling it, but he understood that when the sun shone on it the glass cracked through the expansion of the metal underneath. The Crystal Palace had one charm to him, and that was its wonderful collection of casts from all parts of the world, which cost a great deal of money, and it would be a

FONTAINE DES INNOCENTS, PARIS.

thousand pities if those casts should be allowed to be in any way damaged or destroyed. Many of them he believed had been in the past damaged—at one time during the circus Charley, the elephant, broke loose and knocked down several Venuses.

These various suggestions that had been made for memorial schemes proved that we somehow seemed to grudge money for objects that appealed to the decorative sense. We failed to realise the fact that miserable surroundings made miserable human beings. The decorative objects that we had in London we did not even keep clean. Absolute beauty was on the surface only, and if that was allowed to be corroded with carbonic acid or sulphuric acid they could never get beautiful objects. If one built a house in London they naturally expected to have to clean it more than they would a house in the country, and if we put down a beautiful object in a smoky town we must, of course, expend a little in keeping it clean, or if it was a precious object we must expect to spend a little in looking after it. As a rule, however, we put the object up and said, "Let it do what it likes," and then when it got dirty or discoloured we blamed the English climate. The Albert Memorial was an example of the contrary kind. That Memorial had existed for fifty years, and it was as good to-day as it would have been had it been standing in Paris or Vienna or anywhere else, simply because it had been kept fairly clean. Whilst he was on the subject of that memorial he wanted to point out that there was some very fine decorative work upon it. They generally despised it and thought it was not good, but although it was too polychromatic in colour certain parts of the sculpture were very fine.

The Albert Memorial, by Armstead, together with Stevens' Wellington Monument in St. Paul's, and Gilbert's fountain in Piccadilly Circus, were some of the most beautiful objects of decoration we had in England. The Wellington Monument was perhaps one of the finest examples, and as Stevens,

the sculptor, was trained as an architect, it was a very precious thing to architects and sculptors in England, because it was the key to what he thought, having been trained in both directions, was the proper scale between sculpture and architecture, which was a matter very badly understood here. The lecturer also showed a photograph of a chimney-piece in Dorchester House, which he considered an extremely fine piece of decorative work. Mr. Colton next showed a number of photographs of Hindoo decorative work, and also an instantaneous photograph of a battery of artillery in the field, and pointed out the peculiar movement of the horses' limbs, which, he said, would have to be modified in sculpture, and, to illustrate his meaning, he put on the screen a portrait of the figures on the Artillery Memorial in the Mall. He also showed a number of photographs of fountains in Rome, the fountain of the Innocents in Paris, by Goujon, the Lions fountain at the Alhambra, and the fountains in the Luxembourg Gardens and at Versailles. He also showed a photograph of a fountain which had been designed by himself for Hyde Park, and which had been greatly mutilated. With reference to the latter he said his own feeling about the matter was that it was because the spectators did not understand it—the people had never been educated to appreciate such a thing as a beautiful fountain, and when they saw something strange their natural instinct was to destroy it.

They must bring sculpture close to the masses, and pictures and all beautiful things, if they were ever to be taught to appreciate them. We should throw back the railings in our parks and make the terraces open to the road, and place there sculpture and beautiful flowers and trees, and not have railings in between—that was the fault of all our parks. We should have beautiful terraces with marble seats and fountains and statuary, so that the people could get close to them and love them—it was impossible to appreciate sculpture or pictures in galleries. Museums and galleries were for the highly educated, and even then it often gave one a headache to look at these things. Where the mistake was made was in putting these beautiful things in museums. A school-house and a play-yard could be made a thing of art, but fine designs must be brought to where the people lived. If the man was a potter, working in the Potteries, or a metal-worker in Sheffield, the finest examples must be brought to where he was, where he could see them day after day in his lunch hour. It was impossible to learn the legend of art by coming up to South Kensington Museum on a holiday trip. The mind naturally refused to consider many examples in any art at the same time—it was impossible that it should be so. A work of art until it had become absolutely familiar must necessarily tax the mind of the onlooker. Later on it would be a pleasure, but until that state was reached an effort was always demanded, and for that reason a great number of beautiful works together could not but be a strain on the mind of the observer. Most of them had felt how delightful it was to wander through some of the Continental cities and stumble upon works of

THE THREE FATES.—From the Parthenon.

art unexpectedly, such, for instance, as the statue of the Triumph of the Republic in Paris, and a hundred other examples. What could one find in the way of sculpture say at Peckham, Dalston, or Kensal Green? As a nation we had become mentally drab and gray with the continual cry of utility, by which we were losing the most beautiful part of our lives. He did not merely ask for the encouragement of sculpture, painting, and architecture by "the powers

that be," but he demanded it as a great educational power—an educational force that it was criminal to allow to lie dormant and disused—a force which seemed to him to be the most powerful that could be called upon to fill the void formed by the natural decay of religious beliefs, and it would be at our peril as a nation if we should disregard the influence of this beauty upon the brains of our people through the arts.

SIR CASPAR PURDON CLARKE, C.I.E., C.V.O.

WE are indebted to the *Manchester Guardian* for the following admirable epitome of the career of our friend Sir Caspar Purdon Clarke:—

Sir Purdon Clarke was born in 1846. He was the son of the late Edward Marmaduke Clarke, of Richmond, County Dublin, and of Mary Agnes, daughter of the late James Close, Armagh; but, although settled in Ireland, his father came of an old Somerset family. Sir Purdon Clarke was educated at Sydenham and Boulogne; at the age of sixteen he entered the National Art Training School, where he gained a medal in 1864, and a National Medallion in the following year, which also saw his first official employment as a draughtsman on the Houses of Parliament buildings under her Majesty's Office of Works. In 1867 he was transferred to the architect's office of the South Kensington Museum, then in its earlier stage; and in 1869 was employed by the Museum authorities to superintend the making of a large and valuable series of reproductions of art objects in Italy, the fine collection at South Kensington of paper casts of the mosaics at Ravenna being due to his own industry and ingenuity. In 1874 he laid the foundations of his great knowledge of Oriental art by a visit to Persia, where he was employed for some time as architect of the Consular buildings at Teheran, and in making surveys, some of which led him into remote districts of the country. In 1876 he travelled, on behalf of the Museum, in Greece, Turkey, and Syria. He was architect of the Indian section and commercial agent to the Government of India at the Paris Exhibition of 1878, and in 1879 was once more given the task of collecting art objects for the South Kensington Museum in Spain, Italy, and Germany.

In 1880 began his long association with the arts of our Indian Empire; for, on the breaking up of the old India Museum, he was employed to arrange and classify that portion of the collections made by the company which was deposited at South Kensington. To make the new section completely representative of the industrial arts of India, he was then sent out to India on a special mission of collecting, the fund at his disposal being furnished partly from official sources and partly from the profits of the exhibition of the Prince of Wales's Indian presents. In the execution of this duty he traversed the whole country, and acquired a wonderful collection of fine specimens of native craftsmanship, and especially of textile fabrics and metalwork; he received as a recognition of his success the Companionship of the Order of the Indian Empire and the newly-made post of Keeper of the Indian Section of the South Kensington Museum.

For some time after this appointment Clarke's official progress was slow; but when promotion came it came rapidly. In 1892 he was made Senior Keeper of the Art Museum, in 1893 Assistant Director, and in 1896 Director in succession to Professor Middleton. This important and responsible office he held until 1905, when, to the surprise of everyone, he resigned it in favour of the Directorship of the Metropolitan Museum of New York.

Clarke was a competent and ingenious architect. His official engagements kept him, however, from a large practice of his profession; and the only public buildings which he executed were Cothelstone Church, Durham; Alexandra House, a great boarding-house for women students at Kensington Gore; and the National School of Cookery. But his Indian pavilions at Paris in 1878, at the Indian Exhibition at South Kensington in 1886, and at Paris again in 1889 were extraordinary specimens of artistic design and construction, carried out, for their temporary purpose, cheaply and effectively, but with great skill and plausibility. The French Government recognised these qualities by the award of bronze, silver, and gold medals, and of the Legion of Honour. Clarke was a Fellow of the Royal Institute of British Architects and of the Society of Antiquaries, and a member of the Royal Asiatic Society and of the Royal Academy of Madrid. His direct contributions to the literature of the arts were few; a fine volume on Oriental carpets, produced under the direction of the Austrian Government, was the chief of them. He had little time for authorship,

but was an apt and instructive lecturer. He was a keen Freemason, and contributed some valuable historical studies to the publications of the Quatuor Coronati Lodge.

The customs of the British Civil Service make it almost impossible for a member of it to gain much personal credit for his official work, and the extent of Clarke's labours and influence at South Kensington can never be exactly estimated. He had a genius for organising exhibitions and for arranging for the effective display of art objects, and it was perhaps in these directions and as a shrewd dealer and judge of values that he was most valuable to the institution with which he was more or less directly connected for more than forty years. Perhaps he was hardly so successful in his dealings with men. The restrictions under which he was placed by the cumbersome official machinery which fettered him in his later years at South Kensington worried him greatly, and he made no secret to his many friends of the annoyance that the clerical control of the Board of Education gave to him. He was fairly popular with his own staff, but he did not possess the rare gift of inspiring his juniors with enthusiasm. There is no doubt that he was glad of the opportunity given to him at New York of organising a great museum on his own lines and with a power of absolute initiative which he never had in London, and to this desire he willingly sacrificed all his old associations. But, apart from the purely sentimental side of that sacrifice, the fact need not be overlooked that had he remained he would in a few years have been retired on a somewhat meagre pension, and that the change of office was largely to his financial advantage. He was in private life a brilliant and witty talker, with a keen relish for the unexpected point of view. And he made, and kept, many friends.

Sir Purdon Clarke married Frances Susannah, daughter of Mr. Charles Collins, and had a large family. His eldest son, Mr. Stanley Clarke, has already followed so far in his father's footsteps as to establish himself as a high authority on Indian and Central Asian art and handicraft.

ILLUSTRATIONS.

PUGIN STUDENTSHIP DRAWINGS.

WE this week illustrate some of the drawings submitted this year for the Pugin studentship by Mr. P. D. HEPWORTH, and for which he was awarded a prize of five guineas.

PREMISES, BURY STREET AND RYDER STREET.

THIS drawing, showing the design of Mr. G. THRALE JELL, was exhibited in last year's Royal Academy.

73 SOUTH AUDLEY STREET.

AS an example of the successful treatment of a narrow-fronted London house, this building by Mr. PAUL WATERHOUSE, M.A., F.R.I.B.A., is worthy of study.

DESIGN FOR STAINED GLASS.

THE original drawing by Mr. THOMAS W. CAMM, from which our illustration is taken, was exhibited in the Royal Academy last year.

THE Society of Ordained Surveyors held their thirteenth annual general meeting in Edinburgh on the 6th inst. The report of council for the past session states that during the year three new members had been admitted to the society. The modes of measurement for minor trades, after having been submitted to and approved of by the society, had been printed and circulated among the members. Copies had also been sent to the secretary of the Building Trades Exchange and others for distribution among the various contractors. The charter and the rules and regulations of the proposed Society of Chartered Surveyors of Scotland were submitted by the sub-committee at special general meetings of the society, and were finally approved, subject to the adjustment of one or two small items with the Glasgow Institute. The whole matter had now been adjusted with the Glasgow Institute, and the charter was at present in the hands of Parliamentary solicitors with the view of its being presented to the Privy Council. The treasurer's balance-sheet showed that the funds of the society at the close of the financial year amounted to 540*l.* 4*s.* 6*d.*

THE ARCHITECTURAL ASSOCIATION.

AN ordinary general meeting of the Architectural Association was held on Monday, April 3, at 18 Tufton Street, S.W., Mr. Arthur Keen, President, in the chair.

The election of Mr. J. Archibald, Finchley; Mr. S. B. K. Caulfield, Lincoln's Inn; and Mr. H. S. Davis, St. John's Wood Road, N.W., to membership was agreed to. The following additional nominations of officers for session 1911-12 were announced:—Messrs G. E. Nield, A. G. R. Mackenzie and A. G. Horsnell; also the appointment of the following scrutineers:—Messrs J. S. Cable, G. W. G. Hake, F. J. Mathews, H. A. Thomerson, A. L. Snow and J. Archibald. It was stated that a combined meeting of the Camera, Sketch and Debate Club with the Surveyors' Institution will be held on April 27; also that a visit will be paid to the Building Trades Exhibition at Olympia by invitation of Mr. H. Greville Montgomery on Saturday, April 22; and lastly, that the annual dinner will be held on May 4 at the Trocadéro Restaurant, Piccadilly. Votes of thanks were passed (1) to the Royal Institute of British Architects for its grant of 100l. towards the educational work of the A.A., and (2) to Sir Henry Tanner and H.M. Office of Works for the donation of a detailed drawing made by Mr. Phenè Spiers of Burges's Law Courts front. It was stated that the Herbert Batsford prize of five guineas given annually by Mr. Herbert Batsford for the best drawing published in the Sketch Book has been awarded to Mr. J. M. Whitelaw for the past year.

Professor SELWYN IMAGE (Slade Professor of Fine Art, Oxford) then read a paper on

Architecture in Paintings.

Let me begin by thanking you heartily for the honour you have done me in asking me to come here this evening and read you a paper. I appreciate the honour very keenly. Yet in saying this, and, as it were, in the same breath, I feel that I must offer you an apology, and throw myself to some extent on your indulgence.

When your invitation first came to me, I felt in all honesty bound somewhat to excuse myself from accepting it, not because I did not wish to accept it, but on the plain, practical ground of not being sufficiently equipped, at least upon one side, for doing reasonable justice to your subject, "Architecture in Paintings." No doubt that subject may be dealt with from more points of view than one; for instance, from the architect's point of view, or from the painter's; or, again, from the point of view of theory, or of history, and so on.

But, at any rate, be the point of view what it may, it does seem as if anybody essaying the subject ought to have much more than a surface knowledge both of the art of architecture and the art of painting. Now, of the art of architecture my practical knowledge, apart, let me say, from my appreciation, admiration, love of it, is, alas! far to seek. And so I remember I said quite frankly when your kind invitation came to me. But on receiving your rejoinder—not quite, indeed, in these words, yet virtually in them—that this did not matter—well, what was I to do? You had fairly taken the wind clean out of my sails. If, with your eyes open, you were going to be content with an architectural ignoramus, what was the poor architectural ignoramus to say but "All right!" And so here I am.

And still one word more of apology. I have but few lantern slides to show you in illustration of my remarks, which were obtained under difficult circumstances. I had to run about the other day up and down the town trying to procure a few photographs of pictures that would suit my purpose. It is always a hard matter to find at a pinch just what you want, and so it proved to be in this case. I wanted specially to find photographs of pictures, the originals of which would be known, or readily knowable, by you in our national collection. But the task was not so easy as I had fondly imagined. I did procure with some difficulty what I wanted—more or less. May I hope that you will be somewhat lenient with me when I tell you that, apart from other work, I have recently had, or still have, upon my hands nineteen fresh, separate lectures and addresses, none of which, I assure you, are more congenial to me than this one to the Architectural Association, but most of which have been, or are, more exacting on my energies and my time.

And now to our subject, "Architecture in Paintings." I suppose one may say that the treatment of architecture by painters may be divided under at least seven heads—possibly under more, if one wishes to go minutely into the matter—but these seven may perhaps serve for our immediate purpose. What are they?

First of all, there are those pictures in which architecture is dealt with purely or mainly for its own sake. I am not, of course, thinking of merely literal, topographical representations, which may be extremely valuable and interesting, and even charming, but hardly come under our notice at the moment. I am thinking of the work of considerable painters, as such, yet whose chief aim has been to show us faithfully how such-and-such buildings or groups of buildings at a given moment looked, and who were capable of doing this with a certain artistic effect, so to say, superimposed, the painting having a value as painting beyond its value as a literal transcript of fact. As types of such paintings we may take the works of the two Venetians, Canaletto, 1697-1768, and Francesco Guardi, 1712-1793. Of these two Guardi was the freer, or, I should rather say, the more flicky in his execution of the two—I should put him certainly behind Canaletto. Or, again, we might take our own English academician, David Roberts, 1796-1864.

Secondly, there are the paintings in which architecture is definitely imitated, so to say, as if part of the construction of the work the artist is literally building, if one may be allowed the expression, not with marble or stone, but with his brush and his paint. The most famous type of all such work is, of course, Michelangelo's ceiling in the Sistine Chapel, 1475-1564. In the hands of so immense and unrivalled a genius as Michelangelo, who was himself, remember, an architect, as well as a sculptor and painter, the work is a consummate success. But in lesser hands, as we all know, the attempt after this kind of architectural painting may easily be disastrous enough. Certainly the many disasters it has given rise to make one feel how no man should attempt so Herculean a task, who has not attained to our own Alfred Stevens's ideal of knowing only one art, the name of which is architecture, painting, sculpture, and all the accompanying crafts. Perhaps, in passing, you will let me note about the Sistine ceiling the splendour of its colour. When I saw it, now many years since—alas! there is little chance of my ever seeing it again—the first thing about it that struck me was this splendour of its colour. I think it must strike everybody. And yet, you know, Michelangelo, with the strange modesty of great genius, at first held back from undertaking the commission on the ground that he was not a painter.

Thirdly, there are the pictures in which the architecture, though not, as in the Sistine ceiling, deceptively imitative of actual construction—of course, in a framed painting this could not be—is yet a fundamental part of the design treated with an independent dignity, as if there, so to say, for its own sake—just as in a jewel of the fine order it is the setting that counts, not merely the stone.

In the earlier and middle Italian work especially is this treatment common and amazingly impressive. Let me give you examples of this treatment. The first, an Annunciation, by Carlo Crivelli, 1403-1493; the second, a Circumcision, by Marco Marziale, of about the same date, the exact years of his birth and death being apparently uncertain; the third, the famous Ansdei Madonna of Raphael, 1483-1520.

In Crivelli's Annunciation, indeed, the architecture is almost the picture; if the picture were not so beautiful and so marvellously executed, considering what the subject of it is, one would be inclined to complain a little of the architecture as over-dominant. It is, however, at any rate, a miracle of drawing, of sumptuous decoration, and of colour. So elaborately finished is it up to the minutest detail that I always myself stand before it aghast that one man should ever have had patience and time to accomplish it, let alone all those other numerous works Crivelli executed with equal detail and precision. Still, it is a marvellous picture rather than a great one. You feel that the peacock and the carpet, the gherkin and the apple, have interested the artist as much as the Blessed Virgin and Gabriel; and though there is no lack of proportion in the design and its execution, there is certainly a lack of proportion in the motive or idea of the picture—it is little else, all said and done, than a bit of stupendous decoration.

A nobler creation is Marco Marziale's presentment of the Circumcision. The architecture here, as in the Crivelli, is of importance for its own sake, beautiful and highly decorated, too, but it is not the whole picture, or anything like it; the incident and the figures are the thing, and the architecture sets them off duly, appropriately—it does not swamp them. You may return again and again to gloat over the decoration of the vaulted arches, with their sumptuous mosaics, and the curiously-embroidered vestments; or, say, over the dear little rough-haired dog in front; but it is the sweet, modest figure of the mother, the reverent figures of her attendants, the bent figure of the old priest so carefully

handling the child—it is these that permanently affect you. A greater picture than either of these, the work of a far greater artist, is the Madonna degli Ansdei of Raphael.

Again, here, the architecture is of the first importance, beautiful in its chaste dignity, but this time without any seductiveness of curious or rich ornament; now it is proportion and delicacy alone that make their appeal to us. Indeed, throughout the entire picture there is little enough ornament. But round the canopy of the throne and round its base runs the old Greek key pattern in gold—that amazing invention, which, in spite of its endless employment and endless vulgarisation, one never wearies of. Have you ever noticed how Raphael has drawn it in this picture? If not, notice it the next time you go to the National Gallery. He has drawn it quite “freehand,” as the saying is. The gold lining is not the same thickness throughout, the repeat is far from mathematically exact, the pattern only just manages to get itself into the space. And yet how much of the charm of this ornamentation does really depend on this free treatment. Look at it and think how much would be lost if all were mechanically, rigidly perfect! Do not misunderstand me. I am not counselling students to draw carelessly and flourish about. But when a really great draughtsman sets compasses and ruler aside, and trusts to the sensitiveness of his hand, how incomparably enchanting is the result.

And allow me yet one more word over this picture—a word about its colours. The design, of course, is not that of Raphael at his height; it is a design of the young Raphael, still obviously under the influence of Tintoretto and Perugino. There hangs not far off from it in the Gallery Perugino's famous Madonna, with St. Michael and St. Raphael leading Tobias—a picture whose colour can only, in all sobriety, be called glorious. And yet turn from it to the Ansdei. Not less rich, not less brilliant, not less potent, but with a certain subtlety of gradation and tone, a miraculous, delicate, vibrating light through and over it all that makes Perugino's painting—at least to my eyes—mechanical and—dare I venture to say it?—dull; no, dull, that's too bad a word—let us say hard or heavy. And some tell us that Raphael could be no colourist.

Fourthly, there are the pictures in which architecture is assuredly very important in the scheme of the design, and yet only important as its main accessory, as adding, that is, a certain effect of sumptuousness in the background of the main composition.

I am giving as examples of this treatment two pictures by Paul Veronese, 1528-1588. The first is the famous and magnificent Family of Darius at the Feet of Alexander after the Battle of Issus in B.C. 333. There needs, I think, no insistence upon the motive of the treatment of the architecture here; it is obvious, and it is like that in so many of Veronese's pageantry designs—the superb Marriage of Cana in Galilee, for instance, in the Louvre. As to the subject, the story runs, if I remember rightly, that on this momentous occasion the unfortunate family of Darius—Darius himself having escaped—on their introduction into the august presence of their conqueror, fell upon their knees, not before Alexander, but before his bosom friend—was it Clitus, I forget?—who was the handsomer and more imposing personage. Perhaps, from the action of the main figure, that is what Veronese depicts. I do not know. Anyhow, it is pleasant to hear that Alexander, like a real gentleman, showed no resentment at the mistake, but treated his captives, so they tell us, with the “utmost delicacy and respect.”

In The Adoration of the Magi the architecture is even more prominent or obtrusive than in the Darius picture, but it is still of the nature of an accessory. Up in the left hand corner of the design a portion of the building is ruinous and overgrown with weeds; so that, perhaps, here we are verging upon a merely picturesque accessory. I shall have a word to say on that quality of picturesqueness a little later on, so intimately associated with the representation of broken forms, the broken forms especially of buildings. But the love of picturesqueness in this sense, is, I fancy, comparatively a modern sentiment, and in this Veronese design the ruinous condition of part of the architecture may be not so much picturesque as symbolical—the pride of this world shattered and brought low before the divine Child sheltered even here, amid these stately columns, under a hastily erected shed. In a much earlier Florentine picture familiar to you all, “The Martyrdom of St. Sebastian,” by Antonio Pollaiuolo, a similar question suggests itself. Here a magnificent triumphal arch in the background is shown all broken away at its top, as if to hint, so to say, that the persecution of the Church assured the triumph and sealed the doom of the pagan authorities so cruelly, yet in vain, raging against it.

In any case, of course, not too much is to be made of this symbolism, even supposing that symbolism it is. Yet both Pollaiuolo and Veronese may well have thrown it in, a detail, by the way, in their designs, giving to them some slight additional significance for those who were curious to examine their paintings more than cursorily.

We pass on, fifthly, to those pictures in which, though the architecture is perfect and stately, it is in scale small and unobtrusive, quite carefully and even elaborately presented, yet in the distance as an incident in the further background. Two contemporary works by the famous brothers-in-law, Giovanni Bellini and Andrea Mantegna—Bellini 1428-1516, Mantegna 1431-1506—illustrate this treatment. The breadth, softness, and serenity of this “Infant Christ Asleep on the Lap of the Virgin” are wholly characteristic of Bellini; and these qualities are notable, not only in the treatment of the main figures, but in the placid movement of the little figures, too, and of the cattle in the background; and also, surely, in the disposition and lighting of the towers and castellated walls lying so peacefully up the hillside beyond them.

You may suppose that all this peacefulness and serenity are here only to be in harmony with and to emphasise the motive of this particular picture—the Infant Jesus asleep in His mother's lap. One knows, however, that these qualities characterise Bellini's work in general, so that he loses them not even when his subject neither demands their presence, nor is even quite consonant with it. Thus, for instance, in the more famous picture in the National Gallery of “The Murder of St. Peter Martyr,” there is scarcely less serenity, you may remember, than in this picture—so that one often hears passers-by commenting on this serenity of landscape and accessories as at something incongruous—it is a stumbling-block in their way. Assuredly how vastly different from that other St. Peter Martyr, Titian's masterpiece, once over the altar in the Church of SS. Giovanni e Paolo at Venice, but these many years since destroyed by fire, yet, fortunately, the design preserved for us in engravings. Here all is movement, violent movement—the tall trees swaying under the fury of a hurricane, Nature herself for the moment boisterous in horror at the foul deed being done there at their feet.

Although contemporaries, and so closely connected, from Bellini to Mantegna is a far cry. In the latter's representation of “The Agony in the Garden,” in the middle distance stretches a fair and stately group of buildings, the Holy City Jerusalem accurately and minutely delineated in her strength and pride. Although to serve but as a distant detail, Mantegna, whose love of architecture and sculpture was predominant, and in every thing that he painted his passion for precision amazing, designs and draws for us each building here with elaborate care; nothing is slurred over, or merely suggested; bit by bit the whole range of the buildings is deliberately in detail made out for us. Yet it is part of the miracle of Mantegna's work that with all his passion, as I have ventured to call it, for precision, and his love of detail from one corner to the other of his pictures, we are not distracted, as in Crivelli, by a multiplicity of adornments; but everything holds its place in justly calculated relation of subordination of precedence, the central motive of the design remaining paramount in its human interest, and in its dignity and largeness of effect.

This is so; and, indeed, without this largeness of style and passionate curiosity in humanity—look for an illustration of this latter at the figures of the three slumbering apostles in this picture—Mantegna's exalted position in art would not be what it is; no, not for all his learning, and, in some sense, his unrivalled draughtsmanship. Yet I cannot find it in me to let this mention of him pass without a word commending to you the study of his detail, the detail especially of his foliage and flowers. Even in this awful and harrowing subject of Christ's Agony he cannot resist setting in the foreground these little nameless weeds. And how exquisitely designed they are! How always exquisitely designed, his hand never failing! I sometimes think nobody has ever drawn plants and flowers and fruits quite with Mantegna's union of grace and strength. Botticelli has the grace, but not the strength, Leonardo has the strength, but yet even he hardly the grace. But I refrain, for this you will be telling me has nothing to do with architecture.

We have so far, in the pictures I have mentioned, seen architecture treated by the painters as a thing so dignified and important that even when it enters into the design only as an accessory and on a small scale in the background no looseness or liberties are to be allowed in the delineation of it. Perhaps it was not until a later age, when, for reasons

which we cannot here stay to inquire into, the enjoyment of landscape, and the representation of it for its own sake, began to prevail, that any other pictorial treatment of the mother of arts was possible, or even thought of.

That Titian, 1477-1576, was one of the first, or the first, of the great masters who thus dealt with landscape in a serious manner for its own sake is a commonplace familiar to every student; and there are many splendid landscape designs and studies of his extant to bear out the statement. I am not showing you any one of these on the screen, because, of course, landscape is not our subject this evening; but in the famous picture-piece of his, the "Noli me tangere," in the National Gallery, I think you will feel that it is not mere fancifulness to recognise in the treatment of the buildings in the right-hand upper corner of the background, at any rate, the stirring of a different feeling towards the pictorial treatment of architecture different even to when the buildings have been background accessories on a small scale, as in the Bellini and the Mantegna.

Now, what is the change that has come or is coming about? At its beginning, and here we are at its beginning, it is naturally something easier to feel than to analyse and put formally into words. But may we not say that evidently Titian's concern with the group of buildings in this picture is simply as to their providing him with a dark mass of something in the distance against the sky to serve as a useful mass in the balance of his design? That it is a mass, not of rocks or trees, but of human habitations is natural, because, as a rule, even a pure landscapist likes to get into his scene some hint of humanity—if I may say so, it vitalizes and warms up the scene. But, apart from this, the mass is thought of simply as a mass, the interest in the buildings as buildings is negligible. That is not so with Bellini or Mantegna; but, I venture to say, in this Titian it is. To put my point into general words, we are coming now to a period, to a phase of thought and feeling, in which the painter will use architecture purely for pictorial effect, as a mere item in his design providing some required mass, or space, of light or darkness; the actual forms and details of the architecture will, in consequence, comparatively matter little to him, and their delineation as such will be often vague, or even, in a certain sense, careless. The point, of course, requires more studied and accurate working out and formulating than at the moment I can stay to give it. Still, I think, a real point it is, and I hope I may have made it serviceably plain to you for at least our immediate purpose.

Fifty or sixty years after Titian's death, shall we call it for distinction the purely pictorial attitude towards the employment of architecture has become common enough. This is clearly emphasised in a grand landscape by Gaspar Poussin, 1613-1675, in which it is obvious that the interest is not in any sense in the buildings of the distant town as buildings, but only as they afford an elongated stretch of light balancing the carefully-designed lines and masses of the landscape, charmingly illuminating and vivifying it. The more pure landscape appeals to painters, and the emotions it is capable of arousing are insisted on as the subject of their pictures, the more will this treatment of architecture in their compositions assert itself. Indeed, it is imperative, for obviously it would militate against the effect and impression they are seeking after were they to introduce their architecture more elaborately delineated; it would destroy breadth by focussing the attention on details of construction in a single part of their design, just as in another way it would be impossible in such a landscape as that of Poussin's to treat the foliage leaf by leaf as in Bellini's Peter Martyr, or the foreground of Mantegna's Agony in the Garden, with its weeds, without disaster to its entire scheme and purpose.

You will not, of course, understand me as saying that this generalised and summary method of treating landscape is the only proper and fine method. It may easily degenerate, and, as a matter of fact, degenerate it did, into academic formalism, an almost mechanical application of certain empty conventions of composition. Yet its principles, intelligently apprehended, and applied not mechanically, are capable of what impressive and dignified results? The magnificent Poussin which I commend to you as an illustration of it I spent a long while on Saturday last trying to find in the National Gallery, that I might refresh my memory with a sight of the actual thing; but I searched in vain. To my thinking it is one of the greatest landscapes in our possession—by far the greatest of all the Poussins, and there are several—but at the moment, apparently, it is not rehung on the walls. But when it is, go and look at it; it is worth a world of study, and, amongst other excellent qualities, for

bringing home to us the meaning of scholarly and superb design.

And now we come to the seventh, and last, heading of our subject, as I have mapped it out for the purpose of this evening's paper. Under it I am showing you, first, a picture by Albert Cuyp, 1620-1691—a Ruined Castle in a Lake.

Here, certainly, there is architecture prominent enough; no mere accessory of the general design for the sake of symbolism or play of massed light and dark; the building is itself the thing. Yes, but what is the artist's interest in it? The answer springs to our lips at once—he is interested in the building just for its picturesqueness. He would not have felt the same interest in it supposing the castle were standing in its first pride of completeness and unshattered strength, alert with busy life within and around; but to-day it is deserted, its walls broken and crumbling; over them weeds may now clamber unmolested, and hooting owls circle by night. And the charm of all this ruggedness and decay it is that arrests one hauntingly. Or look at another picture, this time by Ruysdael, 1628-1682, of a motive very similar, the castle here yet more utterly a wreck, just one tottering, crumbling tower and wall of it left, all overgrown at their base with tangled bushes, its design and plan perished out of sight. Or, again, at a landscape of Hobbema's, 1638-1709, a design of trees with cottages nestled among them, such as he loved to paint. It is true the cottages are not in ruins, busy country-folk inhabit them; but they are old and weather-beaten, their timbers are warped, and the lines of their roofs and walls have sunk into quaint irregularities. Smarten them up, make their crooked places straight and their rough places plain—and then? And then Hobbema will say to you, "My friend, you've left me nothing worth painting!"

Well, I do not think I am putting the matter unfairly, over-colouring it for effect; and assuredly it brings home to us how long a way we have travelled from those elder Italians, with their love of order, stateliness, precision; and have passed not merely through many years, but are come out, as it were, at last into a new and vastly different world of artistic conception and enjoyment.

Now all this rugged brokenness, this indecision and irregularity of mass and form, we have learned to speak of as picturesqueness, and to be strangely attracted to and impressed by it. The love of it, as I have already said, is comparatively a modern sentiment; and, perhaps, it could only have arisen in times when men were settling down into a sense of some assured security and physical comfort, and were growing to look upon nature, not as a world of lurking danger, but rather of friendliness and charm. And as this feeling grew, there would grow with it the desire to depict natural scenes, and the sense that, whenever into such scenes were introduced human habitations and signs of human toil, these must in their forms be congruous with the lines and masses and colours of surrounding nature—these, which are never rigid, hard, monotonous, but endlessly and inextricably diversified. And since, as in the elder days, when man and man's work were the main motives of art, the presentment of nature was conformed to their orderliness and precision; so, as nature began to assert herself as for her own sake a motive of his art, the presentment of man and his work, this in its turn was now accommodated to nature, to her infinite variety of form, and her shifting play of colour and light. And so, I think, you will see that our modern love of what we call picturesqueness in the treatment of architecture has a reason and justification in the order of things, and, though with most of us nowadays purely instinctive, it is yet easily capable of analysis, supposing we are in the mood for analysing. It may often lead us, of course, into a degenerate production of merely trivial prettiness, and equally, of course, there would go to its complete analysis several other elements beyond that which I have insisted on. But I have said enough for the moment, perhaps, considering the immediate subject before us this evening—enough, that is, to assure you on behalf of us painters that we are not merely impudent triflers with the supreme art of architecture when sometimes we do seem to approach it a little jauntily at our ease, with neither sufficient knowledge of its principles, nor a becoming reverence for its dignity.

I have endeavoured, gentlemen, in a quite cursory and very imperfect manner, to show you a number of ways in which architecture has been dealt with by various great painters of various times and schools, and this, at least, you hardly deny, that the ways are very diverse. Here, then, as in almost everything else, there is no one law or method to be laid down and universally applied with rigour, but according to the circumstances of the case will be the

treatment adopted; and every reasonable treatment will have its appropriateness, and so its justification and infinite charm. But let us remember we all have our limitations, limitations imposed upon us not only by our natural instincts or tastes, but by our education, and by the character of our work in the world; and in judging of other departments of work than our own, though to judge rightly demands that we should free ourselves in some measure from the restraint of our limitations, to do so is often difficult and distasteful. "The first duty of a critic," it has been said, "is to get himself out of the way"; and though that is not the final counsel as regards criticism, the first it assuredly is. And so, when any work of art is submitted to us, and it is at first sight strange and unacceptable, and runs counter to our innate prejudice or prejudices induced by our professional training, we do foolishly if we dismiss it in petulance with an "It's all wrong, and I can't stand it!" or a "Yes, but that's not my style, and I see nothing in it!" But in quite a different temper we have, if we want to stand on the side of the angels, to put three questions to ourselves, and try to answer them quietly. First, what has the artist aimed at? Secondly, has he attained his aim? Thirdly, was it an aim worth attaining? And, though our first off-hand judgment, prompted by sheer instinct, may prove also our considered judgment, and we may have, after all, to denounce the work right out, it is only because our criticism has passed through this disciplinary process before it utters itself that it is worth listening to, or finally will count.

Mr. CHRISTOPHER W. WHALL formally proposed a vote of thanks to Professor Image for his interesting paper.

Mr. GERALD C. HORSLEY, in seconding this, said it was impossible to follow the Professor into the many sides in which he dealt with the subject in his delightful paper. There was perhaps one side which was particularly interesting to them as architects, and that was in connection with the early and middle Italian examples. These spoke eloquently of the sympathy existing between the painters and architects of that time. In the case of Raphael's *Ansdei Madonna* in the National Gallery the connection between the painter and Bramante was clear. Again, the pictures of Botticelli are full of architectural treatment which brings to one's mind the work of Brunelleschi. Titian and Veronese recall the sympathy between Venetian painters and Venetian architects. This side of the paper, moreover, brings to one's mind the advisability of young architects cultivating as far as possible the society of their fellow-craftsmen of all kinds. If they could meet each other more often the architects' work would gain in interest and vitality, just as theirs would reflect the artistic sympathy which must arise when two crafts meet together. It was a pity that the Royal Academy did not do more in this direction. They welcomed the presence among them of Professor Image as a painter.

Mr. A. T. BOLTON expressed his pleasure that Professor Selwyn Image had selected the National Gallery as the theatre of his illustrations for that night's paper. In that Gallery the nation possessed an extraordinarily interesting collection, and it was very advisable for architectural students to spend all the time they could spare there. The rooms were most admirably arranged so as to give the visitor passing through them a good idea of the development of painting in a single stroll. It is impossible to fail to be struck by the enormous development which has taken place in architecture. Personally he would like to put the development of landscape further back than Professor Image had done, because it seemed as if in two cartoons by Raphael—one showing Christ charging St. Peter with the custody of the sheep and the other St. Peter fishing—one could see its real origin. The interesting point about the work of Crivelli was that it showed painters to be still interested in architectural design and detail; for the detail of Crivelli does not represent any actual building, but the personal design of the painter. Architects nowadays felt that painters have lost touch with them and would put into their pictures most horrible architectural detail—for the same reason as the interior of Millais' house was said to be a miracle of bad taste. This position might be attributed to a speech by Lord Leighton when he pointed out on one occasion that the modern painter looks back to that realm in which Rembrandt was king, *i.e.*, he is interested in light and atmosphere. That was the frame of mind which architects required to understand. Mr. Bolton said one of the most delightful painters of the present day being engaged on a picture a friend took the trouble of setting up the architectural detail for him, but the friend had the chagrin of finding his work was ignored, and the painter made "a mess of it." Painters have their own point of view. An architect naturally studies these things, and argues that

if the painting claims to be decorative then he is directly concerned with it. Veronese was a friend of Palladio; and that combination was as powerful as that of Bramante and Michel Angelo. It must be, continued Mr. Bolton, a most delightful task to come into contact, as Professor Selwyn Image did, with the youth of the governing classes of this country and instil into them the knowledge that there is such a thing as art. He would like to ask the Professor what he meant to do in regard to teaching architecture at Oxford. Oxford seemed in itself a school of architecture, and that art might almost be taught by perambulating the streets and studying the work of all epochs. Possibly the A.A. might be able to help the Slade Professor. It seemed to him that Professor Image might make on a small scale some index of the various architectural drawings, confining himself to Oxford buildings. It might later be possible to get these young fellows (who at present do not take any interest in the subject) to see what they have around them.

Mr. A. B. K. COOK mentioned that when he was at Oxford he was one of about six undergraduates who went to attend the lectures of the then Slade Professor. There were certainly very very few to admire the city's architecture whether Gothic or Classic. The value of architecture in painting is immense, even on the painter himself. In Decorated and Perpendicular stained glass work the architectural canopies set off the figures most advantageously. The same duty was performed by some of the very elaborate gilt frames around the early Italian pictures. The common introduction of ruins by a very large number of Renaissance artists was not done so much perhaps with a view to architectural picturesqueness, but because interest was at the time growing in Classic architecture, and most of this happened to lie in ruins. The effects of this fashion were to be deprecated, because it aroused a misguided admiration for old work. The drawing made by Mr. John S. Sargent, R.A., of the church of Santa Maria della Salute, which was shown last year at the new English Art Gallery, and is now at the Johannesburg Gallery, was, said Mr. Cook, one of the most beautiful things he had seen. Mr. Charles Sims, A.R.A., was another modern English painter with a right feeling for architecture. The colossal scale of the architecture in some pictures, such as Turner's, must always make them interesting.

Mr. ARTHUR KEEN, in putting the vote of thanks, remarked that there was a sense of fitness in Professor Selwyn Image coming to give an address, because his great Slade predecessor, Professor Ruskin, came to the Architectural Association and read a paper. The paintings which had just been discussed had perhaps their greatest interest for them as throwing a light on the many-sided genius of their authors, who could turn their hands to anything. The earlier examples given of architecture in paintings were clearly designs by the painters themselves. The later ones seemed more like transcripts from existing buildings and towns. There would probably be some light thrown on this subject at their next meeting, when Professor Beresford Pite will lecture on Alberti and Bramante. The association of painters, architects, and other artists one with another, to which reference had been made by Mr. Horsley, would be a very fine thing if it could be accomplished. As to the paper, there could be no question that Professor Image had arranged his subject in such a masterly way, and had expressed himself in such a beautiful manner, that it was a pleasure to listen to it from that point of view alone.

The vote of thanks was then put to the meeting and carried with acclamation.

Professor SELWYN IMAGE, in responding, said he had come to the meeting trembling, because his practical knowledge of architecture was nil. With regard to the difficulties of the position of a Slade Professor at Oxford, they were enormous. They were largely owing to the fact that no sense exists there or in any similar body that art is a living concern. He was fully alive to the primary importance of architecture, and considered that it was better they should have Winchester Cathedral preserved than to possess Rembrandt's Mill. He would make no promises as to reforms except to say that he would do his best.

THE "OLD" WATER-COLOUR SOCIETY.

THERE is a plentiful variety both in matter and manner at the Summer Exhibition of the Royal Society of Painters in Water-Colours, which has just been opened in Pall Mall. The contributors include many of the most sought-after younger painters and also some representatives of those who, having already established their reputation, appear to prefer precedent to experiment. Admirers of either class can visit the hundred and fifty-sixth exhibition

in the confident expectation of finding many attractive pictures.

The ever-industrious President, Sir Ernest A. Waterlow, R.A., sends nine works which are typical of his soothing dignified manner. They are unobtrusive landscapes of a kind which would give a purchaser pleasure in whatever mood he might happen to be. Of the three works by Mr. Claude A. Shepperson we prefer "Pas de deux" (5), which is wholly delightful in its quaintness, its conscious artificiality, and its generous colour. Mr. J. C. Dollman has boldly tackled a big subject in the "Thirty Pieces of Silver;" the outcast, Judas, is shown seated alone in a rocky place overcome by remorse. The pervading air of tragedy might assuredly have been even further heightened without exceeding proper limits. Mr. Dollman has chosen straightforward English scenes for his other contributions. An unusually large number of works come from Mr. Walter Crane, who shows himself as much at home in portraying light and shade in Egypt as in showing the wind-cloud effects of France. He has only one purely decorative subject; and it will scarcely be claimed that "A Fire-Dance" will increase his very high reputation, for there seems to be a lack of spontaneity about it. There is quite a different feeling in his two subjects from Montreuil-sur-Mer or "The White Mantle of the Prophet," which is one of five charming Eastern scenes. Mr. Albert Goodwin has presumably become so saturated with Oriental colouring that he converts the skies of "Dartmoor" and "Pevensey" into something not unlike Oriental richness. However, he had no need to restrain himself in "The Citadel, Cairo."

For most visitors to the exhibition the central attraction will be the two contributions by Mr. John S. Sargent, R.A. It was reported some time back that this amazing artist had forsworn portraiture, and was to devote himself to other kinds of painting. Though this is not exactly contradicted by Nos. 31 or 77, yet both hint at the possibility of a return to that lucrative form of art. The first is called "Sketching," and shows two elderly ladies, one of whom is engaged before an easel. The figures are portrayed with a most remarkable vividness. Mr. Sargent stopped at the crucial moment when to have proceeded would only have been mere elaboration of detail, for he had caught all the essentials. His other picture—"The Garden Wall"—is more conventionally correct and less inspiring than the one just dealt with. From anyone else it would be received as a splendid performance, for the balance of the two figures seated before the sunlit wall is most pleasing. Another notable contributor is Mr. Charles Sims, A.R.A., who sent two of his delightfully airy fairy pictures. The obvious fault to be found with them is that they make rather too severe a call on the average spectator's imagination. For example, it is by no means easy to understand "Puck in the Fountain" (55), though that fact will not hinder its recognition as a fine work or the enjoyment of its freshness of colouring. Mrs. Laura Knight has her following, and they will not be slow to admire "Wind and Sun" (187), which represents her here. It is entirely modern in its vigorous treatment.

Eight severely architectural subjects come from Mr. T. M. Rooke. His "Interior—Cremona Cathedral" (109) is a little startling with its bizarre display of tapestries, and suggests that the oft-quoted "blaze of colour" may have been more garish than beautiful in some instances. Mr. Robert Anning Bell probably had no idea of painting No. 86 as an altar-piece, but none the less it would serve for one admirably if a suitable architectural frame were provided.

The above are a few of the pictures which arrest one's attention. The Hanging Committee have been careful to avoid overcrowding, though the small size of practically all the works enables well over two hundred to be placed upon the walls. A visitor will find little to blame and much to praise in the exhibition.

NOTTINGHAM ARCHITECTURAL SOCIETY.

THE first visit of the session took place on Monday, March 27, the building being the new Territorial Headquarters on Derby Road, Nottingham, now being erected from the designs of Messrs. Brewill & Baily, the architects.

Major Brewill, F.R.I.E.A., who had invited the Society, met the party and explained the plans and general arrangements, and then conducted the visitors over the portion now constructed, pointing out the various features and methods of construction.

The building is to be the headquarters of the whole of the local branches of the Territorials, and comprises separate suites of offices for the different sections, large military

stores, a large hall to house the gun-carriages, &c., a large drill hall over the latter, stables and coach-houses, and other requirements of the War Office.

The ground floor, which forms the store for the gun-carriages, is about 100 feet long by 80 feet wide, and it was essential that as few columns as possible should obstruct the floor space. The architects have therefore adopted the Hennebique system of reinforced concrete columns and beams to carry the floor of the drill hall above, which is also constructed on the same system in reinforced concrete. Major Brewill explained the method of arranging the steel bars and the centring; and at the close of the visit Mr. Harry Gill thanked Major Brewill on behalf of those present for his kindness in arranging such an interesting visit.

Among those present were Messrs. W. R. Gleave, S. Walker, F. W. Gregory, W. Hickson and the Hon. Secretary, Mr. F. M. Royle.

On Tuesday, March 28, the Society concluded their winter session with a smoking concert at Calvert's Café, when all the designs sent in for competition in the Designing Club and the measured drawings submitted for competition were exhibited.

There was a capital attendance. During the inspection of the drawings the Cecilia Orchestra, under the leadership of Miss Connie Beaverstock, rendered a number of delightful selections. After an adjournment for refreshments, Mr. S. G. Walker, assisted by Messrs. E. H. Heazell, C. Howell, W. B. Johns and W. Wales, delighted all present with their vocal efforts.

In presenting the prizes, Mr. R. Evans, jun., the President, remarked that he had no hesitation in saying that the work submitted to the Nottingham Society by Nottingham students was quite equal to the best submitted to the Royal Institute in London. This year the work was of such excellence that the Society had increased the value of two of the prizes, and personally he wished he could give every student a prize, but he was only allowed to award the following:—

For the best set of designs: 1, Mr. W. L. B. Leech; 2, Mr. T. C. Howitt. For the measured drawings: 1, Mr. F. E. Collington, for a beautifully drawn set of Hawton Church; 2, Mr. T. H. Whittaker, for drawings of the Chapter-House at Southwell; 3, Mr. T. C. Howitt, for drawings of the old School-House at Risley.

Mr. Evans announced that the Council had highly commended the drawings of Wingfield Manor, submitted by Mr. E. B. Crossland, and those of the York Gate on the Thames Embankment by Mr. G. M. Eaton.

The annual meeting is to be held on April 4, and an inspection of the water-colours at the Castle Art Museum takes place on April 7.

THE ILLUMINATING ENGINEERING SOCIETY.

(Continued from last week.)

THE LIGHTING OF SCHOOLS.

THE question of cost is not one I need discuss. We still require a carefully worked out comparison between the best form of gas illumination and the best form of metal filament electric illumination. There are such returns, but what I suggest is desirable is such a return by a public authority based upon the working of two similarly situated schools over a long period. Further, as a corollary to these returns, we ought to have a return of the relative cost of upkeep in decorations in these two schools.

The recent rapid development of the metallic filament lamp has somewhat disordered our arrangements for electric lighting in homes and schools. Just before these lamps appeared in an effective form lighting companies and authorities in many districts had raised the voltages often very considerably, e.g., in one district of London the voltage was raised from 100 to 240 continuous current. No one remarked the change so long as carbon lamps were in use, but when the metallic lamp became desirable the evil of the high voltage was manifest. Lighting—except for certain special purposes, e.g., lighthouses, public buildings, and shops—needs a uniform distribution of moderately powerful lights. With high voltages we get an uneven distribution of intensely powerful lights; the effect is bad in every way. The blackness of the shadows is intensified and the eyes are injuriously fatigued by the blaze of powerful lamps. To permit educationalists to make the best use of the recent invaluable advances in electrical lighting electricians will

THIS oak lectern was given by the parishioners of Postwick, Norfolk, in memory of their late rector, the Rev. Canon E. S. Medley, son of a former Bishop of Fredericton and Metropolitan of Canada. Mr. H. Watson has well realised the design of Mr. E. Swinfen Harris, F.R.I.B.A. (an old friend of the late rector). Messrs. Gawthorpe, of London, supplied the small brass inserted in the book-board.

need to arrange for low voltages in supply, say not exceeding twenty-five volts, or else evolve a lamp of no higher candle-power than the old sixteen carbon which will be inexpensive and not unduly fragile. The reduction of voltages seems to me the more desirable aim, for with low voltages we can provide satisfactory reflectors of reasonable size and weight; whereas the large long lamps of present usage are particularly unsatisfactory to deal with. This is a matter of great importance, for efficient reflectors are required for metallic lamps not only to satisfactorily distribute the light, but also to reduce by contrast the high specific intensity of the glowing filament.

I should like to be able to get you to compare the lighting effects in two hospitals I work at; in one the voltage has been reduced to twenty-five, and with metallic lamps the effect is perfect in flexibility and softness; in the other a 240 continuous current is irreducible, and the lighting is hard, fatiguing, and wasteful.

As regards the value of reflectors for glow-lamps the following experiments are of interest. A sixteen c.-p. carbon filament lamp was used with 100 volts of the Strand supply. The lamp was hanging in a class-room chosen for its convenience, and the measurements made in a plane four feet below the level of the lamp:—

Shade.	Below lamp.	1 yard.	2 yards.	3 yards.	4 yards
None	5 m. c.	+3	+1	1	1
110 deg.					
3½ inches deep	20	9	5	3	1
80 deg.					
5 inches deep	30	9	5	2	1

Two sorts of opal shades were in use in the schools; one subtended 110 degrees in the sides, and had a vertical depth of 3½ inch. This shade did not cover the lamp, and the incandescent filament was exposed to the teacher's eyes. The other shade had sides subtending an angle of eighty degrees, and with a vertical depth of five inches; this shade completely screened the lamp from the teacher, and was the one to be preferred for class-room purposes, as the light below was also increased by one-third. Glow-lamps

throw an image of the filaments. If a sheet of white paper be held under the lamp at the distance of a yard, four bright stars, each with a bright tail outwards, will be seen marking the corners of a square of one foot side. At the distance of two yards the separation of the points is two feet. The better the reflector over the lamp, the less noticeable are these lines. Ground glass bulbs obscure the lines completely, but frosting the glass reduces the illumination by twenty-five to thirty per cent.

The distribution of the lamps should follow the lines indicated for the gas pendants. Beginning at the left hand of the children's portion of the class-room, a lamp should be hung over the centre of the first dual desk and from there across the breadth of the room at distances of not less than six feet, and not more than nine feet for sixteen c.-p. lamps with ninety degree shades. With gas the fewest possible number of burners is desirable, for the more burners the worse the atmosphere; but with electricity, the points of light may with advantage be more generously disposed, and a cross room spacing of six feet might be uniformly arranged. A second row of lamps should be hung in the same relation over the third row of desks. The lamps, as usually hung, err in being hung too far back; for instance, over a back row of desks, with the idea of their illuminating the desks in front, which they, however, fail to do when the children are present in their seats. The use of a front row of lamps with tilting shades, to light the blackboard in the teachers' section of the room, or desks in the children's portion, fails to serve both purposes in practice. It would be better to use a lamp to illuminate the desk and blackboard, and completely shaded from the children's portion of the room.

Refraction of Light.—There are on the market now a number of excellent devices in globes and shades which aim at the bending of the light rays by prismatic glass. Examples of these were experimented with, e.g., prismatic bowls for gas and Holophane for electric light. The prismatic bowl is most satisfactory, particularly when a flat opal sheet rested upon the open mouth of the bowl. The Holophane productions are very satisfactory with electric light, and

have been strongly recommended for school use by American writers.

Indirect illumination by reflection has been highly recommended as affording the most perfect and natural mode of illumination. One reads of its adoption in some of the newer German schools. By this method powerful lights, usually arc-lamps, are hung from the ceiling with metal reflectors below them, the light is thrown up on to the white ceiling or to special reflectors, and reflected as a delightfully uniform and soft radiance over the whole room. The effect is not unlike daylight of modified brilliance, and it is largely and most successfully employed in shops and showrooms where deep shadows of direct light would be destructive of the general effect of mass and colour. I have also a very favourable impression of its use in museums. Of its use in work-rooms, where continuous and detailed work at the desk is required, my experience is unfavourable. The system was adopted in the New Anatomical Laboratories of Cambridge University some fifteen years ago, but it had to be superseded by the direct glow-lamp illumination.

In conclusion, it may be thought that no review of school lighting will be complete without a reference to the effect of certain rays upon sight. The harmful effects of ultra-violet rays have been made much of in quite recent months; already the literature of the subject is great. I should like to refer you to the work of Lieutenant-Colonel Pisani, I.M.S., presented to the London meeting of the British Medical Association in 1910. He dealt with the incidence and distribution of cataract in India, and with the possible causes that might account for the striking inequality of its distribution. The conclusion of his examination into the several possible causes was to wholly discount the influence of ultra-violet rays, for these rays are most abundant in the light of mountainous regions, and there cataract is least prevalent. It would appear from these and other researches that what we most need to trouble about is the provision of a sufficient and satisfactorily distributed light, and these ends are within our grasp.

The President said there was a communication from their esteemed member, Dr. Ettles, who had been prevented from attending the meeting, and he would ask the Hon. Secretary to read it.

Dr. Ettles said the first school hygienist was an English oculist named James Ware, who in 1813 showed that short sight and excessive bookwork were related as effect and cause. The real awakening to the necessity of proper surroundings during childhood was due to Professor Cohn of Breslau, as was mentioned by Dr. Kerr. We were constantly told that the refraction of the juvenile eye was hypermetropic. This idea seemed to be based on the fact that the axis of the eye was shorter than in the normal adult eye. He had very often examined under atropine the refractions of healthy children, and had found no hypermetropia in normal eyes. The facts of the case, as he understood them, were that the crystalline lens in infancy was much more spherical than it was in the developed eye. There was a constant ratio between increased lens curvature and shorter axial length, which made the eye normal, and he submitted that the accepted view that all infant eyes were hypermetropic was only a general error. Then we had the equally common statement that there was a progressive development from hypermetropia via normal vision to short sight. Here again he submitted that observed facts clash with the theory. By far the greater number of eyes developing myopia did so by the astigmatic route; and at no period of the child's history had we a condition of neutralisation with temporarily perfect sight in those cases which become short-sighted. He entirely coincided with Dr. Kerr's views on the question of daylight illumination. There was, however, one amplification he would make, and that was on the influence of wrongly-directed daylight on posture. If one looked at a class seated in a room with the light coming from behind, one could not help being struck with the contorted efforts of the scholars to keep their body shadows off the book. It must have had an evil effect on the growing spine to have that faulty attitude renewed day by day. As to artificial illumination, he was very strongly in favour of shaded and inverted arcs. The ceilings and walls could not be too white or bright, although they ought not to shine, because no artificial light could be lighter than full daylight. The source of illumination should never be visible to the workers in a class; what must be aimed at was plenty of diffused light. It was not really essential that the inverted light should be an arc lamp, but in his opinion that gave the most effective solution of the problem. The inverted arc should be placed to one side of the room, that is to say, to the left of the scholars, so that the shadows might be as nearly as possible similar to those obtaining under daylight

conditions. Arising out of this question of illumination, there was an important point. Ideal surroundings might be arranged for the children while at school, but how were we to combat the bad surroundings at home? The best way would be to abolish home lessons altogether, otherwise, if tasks were set, children read by firelight, by any light, and sometimes almost no light, and the harm done at home would negative the thoughtful care of those having charge of them at school, as well as bring into undeserved criticism the use of the precautions they had taken.

The President said they had had three communications from what might be termed the medical point of view. There were a number of gentlemen present who were prepared to speak from other points of view, and in this connection he wished to mention how extremely indebted the Society was to find that the invitation which had been addressed to other bodies had been responded to. They had several representatives of the Association of Technical Institutions, including the heads of several of them; there were representatives of the Association of Medical Officers of Schools, and one representative at least from the London Teachers' Association, and by no means least, although he named them last, there were several officials of the London County Council from other departments than the actual Education Department. There were also two or three medical gentlemen present whom they would be pleased to hear if there were time, on the more specially medical aspects of the case. But they had something else; in fact, they had an *embarrass des riches*. Their indefatigable Hon. Secretary and his assistant had, on their own hook, so to speak, obtained permission from various bodies to examine the lighting of a number of schools, and he would first of all ask one of them to give the result of their investigations.

Mr. J. S. Dow (assistant hon. secretary) said that at the suggestion of Mr. Gaster, he had visited a number of schools in London, and had to express his great indebtedness to Dr. Kerr, Mr. Fitzmaurice, the chief engineer, and Mr. Baker, the electrical engineer to the London County Council, for granting the facilities. He believed it was intended to present a more comprehensive report dealing with various schools and colleges. Therefore, he would only make a brief reference to one or two schools which he had the privilege of visiting. He aimed chiefly at measuring the artificial light, but he was interested to find that in every class-room and lecture theatre that he visited the windows were arranged on the left-hand as suggested by Dr. Kerr. On the other hand, window lighting from one side of the room only had the defect that it was the cause of the daylight varying in a perfectly amazing way, and there was the danger of the children furthest from the windows having a very poor light indeed, whilst the effect would not be noticeable to the teacher. For instance, in a recent visit to the Birkbeck Institute, the illumination on the desks near the window at eleven o'clock in the morning was thirty foot-candles, whilst on most of the remaining desks it was down to half a foot-candle, which was too little. He was informed that artificial light was almost invariably used. This was a case of the greater portion of one side of the rooms being windows.

At the Haverstock Hill School the artificial lighting on the desks varied from about 2.5 to 2 foot-candles, but the daylight illumination at the moment he was there, late in the afternoon, varied from 2.6 to 0.4. The artificial illumination was used to supplement the daylight in certain portions of the room, but the combination of artificial and natural light was not always pleasant for reading purposes. Electric light was used. The artificial lighting of the blackboard was about $3\frac{1}{2}$ foot-candles. With the shade used it was almost impossible for the children to see anything of the lamp, and the general result was a very uniform illumination.

Another school which he had visited was the Charing Cross Road School, where naked carbon filament lamps were used, resulting in the watts per square foot being large, from 1 to 1.1. If metal filament lamps were substituted, this could easily be cut down, and yet get a better light. In the cookery room, the lights were placed quite irrespective of the tables, so that the illumination on the dressers was very feeble, about 0.2 or 0.1. There was a fairly good light over the sink, and over the desks the illumination was about 1.5, but the lamps could all be seen by the students, and there was also the danger of the teacher's head getting in the way. At the demonstration table, where the lights should probably be better than anywhere in the room, the illumination was only about 0.8 foot-candle. In the laundry room, also, the lights were arranged pretty well irrespective of the tables, but the illumination of the gangways, from 1.8 to 2.8, was fairly good. But in the other part of the room where the sink and mangle were situated, there was hardly any light at all. The

blackboard illumination was only about 0.5 foot-candle, and even at short distances it was not easy to see the chalk marks. With the grey backgrounds of some blackboards it was really necessary to have a higher illumination than was necessary for reading in some cases.

At the Richard Street (Islington) School the arrangement of the gas lights was very similar to the electric lighting in the other schools he had visited, and the illumination was also of the same order. In one class-room there were $3\frac{1}{2}$ foot-candles on the blackboard, without a shade, and some improvements were possible by the use of shades. Mr. Dow then showed some figures obtained from a German source, the illumination being expressed in "lux," which is about one-tenth of a foot-candle. Generally, the foot-candles were considerably higher in the German schools than in this country, going up to 80 lux. Figures were given of schools lighted by inverted arc lamps, high pressure and ordinary gas. He thought these figures demonstrated that more research into scientific illumination had been carried out on the Continent than in England.

He next dealt with the Arts and Crafts Schools of the London County Council, where a different order of illumination was required owing to the different character of the work. The conditions at these schools struck him as favourable in many ways. He met no single case in which the lamp filament could be seen. In the majority of rooms the illumination was from 4 to 8 foot-candles, but in the jewellers' room, where they had the water lens, it was possible to go up to from 18 to 28 foot-candles on the one little bright spot.

The interesting fact in connection with all these results was that there seemed to be some sort of agreement that 2 foot-candles was the minimum for desks, and it did not seem a difficult matter to prescribe this as a minimum, although for certain classes of work, such as sewing, shorthand, and music, a higher figure than that was required. Complaints had come from some of the rooms given up to these subjects, and it was found that the illumination did not exceed 2 foot-candles. A difficulty arose where rooms were used for different purposes, but when they were used for only one purpose, then a standard should be prescribed.

OUR CONTEMPORARIES FROM OVERSEAS.

THE American Architect (New York) illustrates a number of competitive designs, being those for a municipal building for Hartford, Connecticut; for a building for the Department of Justice, Washington; for a Confederate Memorial, Richmond, Virginia; a series of drawings of the Winnipeg branch of the Bank of Montreal, of which the firm of Messrs. McKim, Mead & White are the architects, is also given.

Berliner Architekturwelt (Berlin).—The principal contents this month are competition designs for the artistic layout of the Rüdeshheimer Platz, Berlin, including the first premiated one by Heinrich Berg & H. von Hoven; a church and parsonage in the Nikolassee suburb by Erich Blunck; two picturesque villas in Dahlem-Grunewald, and a premiated design for the Bismarck Memorial at Bingen by E. Schütze, Otto Kohtz, and Rudolf Kohtz.

La Construction Moderne (Paris) illustrates a typical modern French country house at Pont Saint-Esprit by Mons. Baussan.

Het Huis (Amsterdam) continues the description of Old Zutphen commenced last month, and also contains an interesting article on the "Boompje" at Amsterdam. Both of these are fully illustrated.

Engineering Record (New York) contains an account of the use of steel piles formed of pipes filled with reinforced concrete in the foundation for a seven-storey brewery at New York. The present use of bituminous materials in American roadwork is the subject of a paper by Professor Arthur H. Blanchard, read before the American Association for the Advancement of Science.

The **Architectural Record** (New York) has two illustrated articles of more than usual interest, one on "Some details concerning iron accessories to domestic architecture," the other on "The treatment of the pergola." The former is chiefly concerned with Spanish examples, the latter includes instances from both American and English practice. The residence of Mrs. H. B. Gilbert in New York is styled an "excellent Gothic residence," but, although the street front is a good design in French Flamboyant, the interior seems to be mainly a collection of various phases of Renaissance.

To Save the Crystal Palace.—Now or Never.

SIR,—The public does not yet realise that the Crystal Palace is in most serious and imminent danger of total extinction.

The Judge has ordered the Receiver to sell it.

A housing and town-planning scheme for its beautiful grounds—to be prepared at the public expense—is on the agenda of the London County Council, dated March 16, 1911. Do the people realise that thus they are invited to pay a large sum to help to cover the grounds with houses and streets? Unless the King Edward National Memorial is supported there is little doubt that the palace will be closed to the public within six months from this date. And that means for ever. Shall the Palace be saved to the nation and Empire? It is a case of now or never.

This Council, supported by very many persons most prominent in science, art, literature, the drama, the services, the church, and society in general, is most desirous of saving it to the people of the nation and Empire for ever, as the King Edward National Memorial. They then desire it to be so run as to secure benefit to the nation and pleasure to the people. Its control is to be by fourteen persons publicly elected; whilst all profits are to be given to national and popular objects. (Here it may as well be said that no member of this Council has any financial interest whatever in the Palace, nor in its sale or purchase.) The Palace can be saved within one week if each reader will send one guinea—either in one sum or in instalments, and to each subscriber of one guinea we give a life-free admission ticket to the Palace—which should be worth many guineas. And if for any reason we cannot acquire the Palace the money will be returned. Large gifts have been received, and others will be welcomed. Every subscription will be publicly acknowledged. Thousands are supporting the movement, but we need one million.

Special privileges are offered to firms and future exhibitors who subscribe large sums. Particulars are sent to inquirers. An anonymous donor has given one million (1,000l. worth) of Crystal Palace stamps to sell at one farthing each. Every purchaser of 25s. worth (which may be purchased in instalments) will be given a life-free admission ticket. Thus by selling the stamps the life ticket will cost him nothing. All further particulars may be obtained from, and cheques crossed "Lloyds Bank, St. James's Branch," should be addressed to,

The Right Hon. the Earl of Kinnoull, D.L.,

The King Edward National Memorial Office,

26 Shaftesbury Avenue, Piccadilly Circus, London, W.

The above privileges are offered to members of the nation, the Colonies, Dominions and dependencies throughout the Empire. (Will Colonial papers please copy.)

Thanking you for your courtesy.

Yours faithfully,

TENTERDEN (Chairman),

KINNOULL (Hon. Treasurer),

DECIES,

ALFRED E. TURNER, K.C.B., Maj.-Gen.,

W. H. TREACHER, K.C.M.G.,

WILLIAM P. TRELOAR, Bart.,

W. J. POTTER.

(Council.)

MR. W. A. SCOTT, A.R.I.B.A., M.S.A., Dublin, has been appointed to the vacant Professorship of Architecture in University College, Dublin, by the Dublin Commissioners appointed under the Irish Universities Act.

At a meeting held at Northampton in the rooms of the Northants Architectural Society a new association was formed, to be known as the Northamptonshire Association of Architects, which will be open to architects in practice in the town and county as members, and to architects' assistants and pupils as associates. Mr. J. A. Gotch, F.R.I.B.A., of Kettering, has consented to fill the position of president, and Mr. Sidney F. Harris, F.R.I.B.A., will act as vice-president, whilst the secretarial duties have been undertaken by Mr. Herbert Norman, Northampton.

FORTHCOMING EVENTS.

Wednesday, April 19.

York and Yorkshire Architectural Society: Mr. H. E. Henderson on "The Domestic Architecture of the Yorkshire Dales."

Saturday, April 22.

Building Trades Exhibition, Olympia, opens April 22—May 6.

Monday, April 24.

Architectural Association: Professor Beresford Pite on "Alberti and Bramante: Architecture a Profession or an Art in the Cinque Cento."

Surveyors' Institution: the adjourned discussion on Mr. W. R. Baldwin Wiseman's Paper on "The Conservation of our National Water Resources," and on Mr. W. Vaux Graham and Mr. H. F. Bidder's Paper on "Judicial and Parliamentary Decisions with regard to Rights in Underground Water since 1907," will be resumed.

Friday, April 28.

Society of Architects: Twenty-seventh Annual Dinner to be held at the Holborn Restaurant.

COPYRIGHT IN ARCHITECTURE.

THE Bill introduced this Session into Parliament by Mr. SYDNEY BUXTON, though somewhat different in arrangement, is practically on the same lines as that of last Session, but with some amendments affecting architecture that are probably the result of criticism on the earlier drafting.

Whereas in the previous Bill it was provided that "copyright in a work of sculpture in artistic craftsmanship, if situate in a public place or building, and copyright in an architectural work of art, shall not be infringed by making paintings, drawings, engravings, or photographs thereof," it is now proposed to be enacted that an infringement of copyright is not constituted by "the making of paintings, drawings, engravings, or photographs of a work of sculpture or artistic craftsmanship, if situate in a public place or building, or the making of paintings, drawings, engravings, or photographs (which are not in the nature of architectural drawings or plans) of any architectural work of art." Thus it will be open to students to make sketches or photographs of a modern building, but it will not be permissible to make measured drawings without the sanction of the owner of the copyright.

It has been objected that the provisions of last Session's Bill created a dual ownership in architectural copyright by the stipulation that copyright should belong to the person by whom a work was ordered "unless the work is an architectural work of art, or is an artistic work intended for a public place or building, in which case the author shall be the first owner of the copyright, but shall not be entitled to make, or authorise the making of, reproductions of the work except with the consent of that other person, and that other person shall be entitled to the same remedies in respect to the infringement of the copyright in the work as if he were the owner of the copyright." The effect of this would have been that when an architect had designed a building for a client "for valuable consideration," the architect would have been the owner of a copyright which he could not utilise without the consent of the client, whilst the client could not erect, or permit anyone else to erect, a replica of his own building because the architect would be owner of the copyright. Thus there would be created, not really a dual ownership, but a dual disability to make use of a property created by the Bill copyright in an architectural work of art.

This objectionable arrangement is now entirely cleared away by the section (5) which defines the ownership of copyright: "Subject to the provisions of this Act, the author of a work shall be the first owner of the copyright therein." The only exceptions to this are that "(a) where in the case of an engraving, photograph, or portrait the work was ordered by some other person and was made for valuable consideration in pursuance of that order, then, in the absence of any agreement to the contrary, the

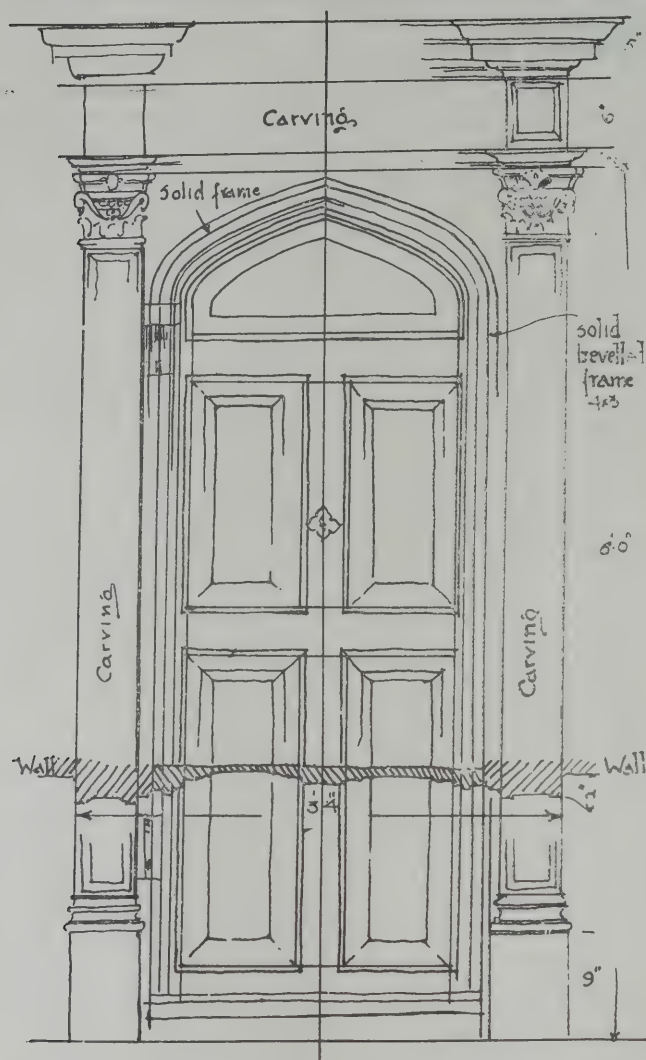

person by whom the work was ordered shall be the first owner of the copyright; and (b) where the author was in the employment of some other person and the work was made in the course of his employment by that person, the person by whom the author was employed shall, in the absence of any agreement to the contrary, be the first owner of the copyright." Thus an architect equally with a sculptor or a painter (except in the case of portraits) will as the author be the first owner of the copyright of his design. The architect's assistant, however, cannot claim copyright even if he entirely makes a design for his master.

Civil remedies in the case of infringement of copyright are not very clearly defined, it being provided that the owner shall "be entitled to all such remedies by way of injunction or interdict, damages, accounts, and otherwise, as may be conferred by law." In the case of architecture it is reasonably still proposed to be enacted that the completion of a building which infringes copyright shall not, when once commenced, be prevented by injunction or interdict, nor shall the building be demolished or become the property of the owner of the copyright as is provided for pirated books, music, and all other works in which copyright subsists.

Thus the Bill, if passed in its present form, will not necessarily prevent piracy or copying of an architectural work of art, but will merely enable the owner of the copyright to obtain some compensation for the piracy, and the amount of this will have to be settled by the Court. The recognition of any copyright in architectural design is, however, so entirely novel in this country that we should be thankful for small mercies. Some day it may be realised that piracy is inimical to the art of architecture.

The definition of an architectural work to which Professor REGINALD BLOMFIELD has taken exception still remains: "'Architectural work of art' means any building or structure having an artistic character or design, in respect of such character or design, but not in respect of the processes or methods of its construction." We think the intention of the Bill is clear. You cannot copyright bricklaying, or masonry, or reinforced concrete as processes or methods of building, but you can copyright an arrangement of bricks, or stone, or concrete that possesses artistic character or design, not necessarily ornament, which is a term not mentioned in the Bill. Indeed, it would seem that there is a correct recognition that artistic character or design may exist quite independently of ornament.

In forming an opinion on the Bill at present before Parliament, there are a few salient facts which architects ought to recognise. First, it is now by way of being legally recognised that architecture is on a plane with other arts; next, that there is a difference between an architectural work of art and a mere building; further, that the architect who creates a work of art is worthy of recognition

CHAPEL DOOR AT COMPTON WYNYATES.—Measured by Mr. BANISTER F. FLETCHER, F.R.I.B.A.

and protection, for which purpose there is created for him, now for the first time, a new form of property, copyright.

There need not, we think, be any fear that the creation of copyright will have a dwarfing effect on progress in architectural design. There is a large amount of material in what is known as the "domaine public," which is at the service of everyone. Reproduction of a copyrighted work must include a "substantial part thereof" to constitute piracy or infringement. An author may grant permission for a partial as well as for a total reproduction of his copyright.

NOTES AND COMMENTS.

THE short Bill which has been introduced in the House of Commons entitled "Public Health (Sewers and Drains) Bill" has for its main object an amendment of the definitions of "sewer" and "drain" in the Public Health Acts. Under those definitions any drain used for the drainage of more than one house becomes technically a sewer and therefore vested in and repairable by the local authority, even though it may be wholly situated on private property and used as a single private drain. This distinction between a sewer and a drain has led to many difficulties, and the attempt at overcoming them made by the Public Health Acts Amendment Act, 1890, has only made confusion worse confounded.

It is true the difficulties have been more acutely felt by officials of Municipal Corporations and District Councils than by the public generally, and therefore it is readily comprehensible why the present Bill has been introduced at the request of the Association of Municipal Corporations and of the Urban District Councils Association.

THE chief provision of the "Public Health (Sewers and Drains) Bill" is that for the purposes of the Public Health Acts, 1875 to 1911, every sewer is to be a drain except sewers along or under any highway; sewers acquired or constructed by a local authority; sewers conveying sewage from the foregoing; sewers made by any person or company for profit; sewers made and used for the purpose of draining, preserving, or improving land under any local or private Act of Parliament or for the purposes of irrigating land; sewers under the authority of any commissioners of sewers appointed by the Crown; sewers within the district of a local authority which have been, or may hereafter be, constructed by or transferred to some other local authority, or by or to a sewage board or other authority empowered under any Act of Parliament to construct sewers; any natural water-course or ditch which had become a sewer at the date of the passing of this Act.

WHEN a drain (which is now a sewer) used for drainage of two or more buildings belonging to different owners requires alteration or amendment the Bill provides that the local authority may call on the owner or occupier of any one of the buildings to do the work within any such time as the authority chooses to fix. If the work is not done accordingly the authority may do it themselves and charge the cost on the owners of all the buildings in equitable shares and proportions. This will probably mean that the local authority will always do the work, as there appears no provision in the Bill for the one owner or occupier selected to recover any share of the cost from the others, nor is there, necessarily, to be sufficient time allowed to enable him to enter into negotiations and agreements with the others.

REGISTRATION appears now to be approaching rapidly and those architects who do not wish to be left out in the cold would do well to take early advantage of the grace that has been offered by an extension of the time during which they can apply for being included amongst the Licentiates of the Royal Institute of British Architects. Of course, those *soi-disant* "architects" who unite with their artistic efforts the more lucrative callings of auctioneers and undertakers need not trouble to apply, and those who are reluctant to sign an undertaking that they will not accept illicit commissions will naturally remain outside the fold.

Now that the scheme for London's Memorial to King EDWARD as an alteration to St. James's Park has been definitely abandoned in deference to the very considerable expression of disfavour there are naturally many alternative suggestions in the field, some of which are based upon the principle, which we have already put forward in a previous Note, of making the Memorial part of the Mall processional road. Amongst these are the suggestion of Mr. MARTIN, M.P. for St. Pancras East, of an arch over the Mall, and the scheme advocated by Mr. JOHN SMITHERS of a statue and adequate approach to the Admiralty Archway from Trafalgar Square and Charing Cross. We think something might be made of this latter scheme.

THE Copyright Bill having been read a second time it now remains for the Committee stage to make or mar its utility. As far as architecture is concerned we do not think there is a great deal of improvement to be made in the present state of public feeling towards our art. We should like a little more than the Bill gives us but should be content, for the present, with what we are already promised.

SCOTLAND's attempt at a national memorial to King EDWARD seems to have ended in failure from the antipathy of Glasgow and the West to a scheme which included Holyrood as its basis of operation. Hence it would appear that whilst Edinburgh and its neighbours in the East will make the Holyrood scheme their memorial, Glasgow and the West will inaugurate a crusade against consumption or something else that is not near Edinburgh as the basis of their memorial, if they can so far agree amongst themselves on any one definite proposal.

THE PAINT AND VARNISH SOCIETY.

AT a meeting held on April 6, Mr. Noel Heaton read the following paper on "The Decorator of Ancient Times":—I suppose that if there is one thing more than another to which we, as a society, are devoted, it is progress. Our society was formed with the avowed object of encouraging the application of scientific methods in the production and use of decorative materials; that object, I take it, we all have at heart.

It may seem out of place, therefore, at first sight, to a society of this sort, to pay any attention to the past, when all our efforts are concentrated on the future. But, occasionally, it is useful even for the most progressive body to look back, and see if it is not possible to draw any lessons from what has been done in past times. It is an efficient corrective to swelled head, to mention only one point of view, to be brought face to face with the realisation that brains were invented long before the twentieth century, and that sometimes methods and processes which we to-day hail with advertisements and puffs as the latest products of scientific achievement, were used when the world was young, and have been forgotten and buried in the dust of centuries.

It is a mistake to ignore the past; it is equally a mistake, however, to follow in the footsteps of those whose gifted imaginations are developed at the expense of their powers of accurate observation, and to accept their wild tales of the wonderful works of the past without criticism and without inquiry.

I suppose there are few subjects about which such hazy ideas exist in the mind of the average man as to the history and development of painting and decorating in modern times, and when we go further back and consider how the

decorator set to work to embellish the luxurious houses of Rome in the palmy days of her civilisation, one so often sees such wild and impossible ideas set forth even in print that I thought it might not be without some interest to you to-night if I were to endeavour to clear the matter up to some extent.

Of course, when one discusses ancient times from any point of view, one is expected to begin by saying something about the period which is generally somewhat glibly summed up as "that of the ancient Egyptians." I think some people have the idea that the Egyptians all lived at the same time; they would not think much of the boy who got mixed up between the Battle of Waterloo and the Battle of Hastings, although the difference in time involved would be a small one in the history of the civilisation of Egypt. This, however, is by the way: I want you to look at the illustration I now show you of a portion of the decoration of the Palace of Sneferu. This is one of the earliest examples of domestic mural painting of a developed nature extant, and it can be dated with fair certainty at 4700 B.C. (that is, remember, nearly eight times the period that separates us from William the Conqueror).

A specimen of this same painting lies on the table before you, and from it you will have no difficulty in following how the man who made it set to work. First of all he levelled the rough surface of the wall by a liberal coat of mud worked up with bitumen and straw, on which was then laid a second coat of similar composition, only very much finer in texture. On this, again was laid the final coat of fine plaster, about one millimetre in thickness, which formed the smooth ground for the painting. On this ground the painting was executed in distemper, the pigments being mixed with gum orsize. It is practically impossible to determine the exact nature of the adhesive, but the important point is that the painting is distinctly water-colour, and can be obliterated in a moment by passing a damp sponge over the surface; in fact, the whole fabric of the plaster is destroyed and converted into mud on immersion in water.

This forms an excellent illustration, therefore, of one fact about ancient paintings which is frequently overlooked. You look at this specimen, and you notice that after 6,000 years it is, to use the recognised phrase, "as fresh as the day it was painted," and perhaps you draw conclusions as to the wonderful secrets they had in those times. But I say to you that a painting executed in this manner to-day would not survive the ordinary wear and tear of a London house for six months. As Dr. Immerheiser was telling us last month, permanency is a relative not an abstract term, and before you fall down and worship the master decorator of the Pharaohs, and raise golden images to Isis and Horus, remember that these paintings have lasted because they were executed in a climate that knows no rain and is never damp. They were as a rule, moreover, protected from the light and the effects of wear and tear, for you must remember that, as regards the great majority of Egyptian relics, they are obtained from the elaborate rock tombs which formed an essential feature of their religion, and, to all intents and purposes, were hermetically sealed from all destructive agencies. As you are all aware, the most fragile things have been preserved under these conditions, and have come down to us in perfect preservation to grace our modern museums. I have chosen this particular example, however, because it formed part of the decoration of a building more or less domestic in character, and was, therefore, probably subject to something in the way of wear and tear.

The plaster work we are now speaking of was not, however, the most usual method of house decoration at any time in Egypt. The walls were more commonly covered with designs cut in the freestone, the incised portions being picked out by means of a wash of water colour. Elaborate inscriptions and decorations of this nature were characteristic of Egyptian craftsmanship of all periods, and are too familiar to all of you to need any description; but I would like to refer in passing to the experiment in decoration illustrated in this slide, which represents, as you see, a crane, a man, and a monkey, in a most realistic way, and is part of a most charming series of decoration from the chapel of Nefermaat, at Mejdum. I have no doubt that many of you have seen the original, which was exhibited at University College last July, when Prof. Petrie kindly allowed me to take these photographs.

The method of execution was as follows:—The design was first incised in the stone, the edges being somewhat undercut, and the ground left rough and scored over so as to give a key. The incised portions were then filled up in

flush with the surrounding surface with coloured pastes. I have not had an opportunity of examining these pastes myself, but, according to Dr. Russell, they were prepared by mixing the various pigments with a sort of mastic varnish into the consistency of putty.

We gather from the inscription that Nefermaat was immensely proud of this new departure in decoration, and it was confidently anticipated that it was going to provide what from that day to this conscientious artists have been looking for, but what is to-day as elusive as ever—an absolutely imperishable and permanent method of decoration. Whether it was that even in those days the question of expense had to be borne in mind, or whether the journeyman painters, anticipating the silversmiths of Ephesus, rose as one man and slew the inventor, the inscriptions do not record, but it is certain that the process did not attain popularity, and, in fact, no other instance of its use has been discovered.

The colour washing of stone and the painting of plaster in distemper remain the characteristic methods of decoration down to the time of the Ptolemies. In the palace of Akenhaten (1400 B.C.) at Tel-el-Amarna, for example, paintings on plaster were found executed in distemper in practically the same manner as the example of 3,000 years earlier I have just described; of this later work the well-known picture of the Princesses in the Ashmolean Museum is an example.

But whilst these things were being done in Egypt, there was arising in the Mediterranean another great community which was destined to play a most important part in modelling that European civilisation of which we of to-day are the products. The Minoan civilisation of Crete is so familiar to most people to-day that it is difficult to realise that its very existence was a matter of legend and conjecture until Dr. Evans commenced his epoch-making excavations at the palace of Knossos, scarcely more than ten years ago, and set the archaeologists of four nations vying with one another as to who should reconstruct best the history and the customs of King Minos and his people.

It would, of course, be quite impossible in the time at my disposal, as well as out of place, to attempt any description of Knossos and the other Minoan palaces found in different parts of the island; I can only give you a bare outline even of the one aspect of their civilisation which more particularly interests us, namely, the extent to which they had developed the art of domestic decoration.

This is perhaps one of the most interesting of the many extraordinary discoveries brought to light by these excavations, for we have here a clue to the origin and development of a process of decoration which was the chosen medium of many of the great artists of our own era, and was in a humbler sphere the recognised method of house decoration until modern times, when it was gradually supplanted by oil painting. In saying this I am referring to the fact that the Minoans during many centuries maintained the tradition of decorating their houses throughout with fine plaster painted in fresco, and in the culminating period of their civilisation covered their walls, their ceilings, their floors, and even their stairs with a most elaborate and detailed scheme of decoration produced in this manner.

I take it that you are all more or less familiar with the manner in which a fresco painting is executed, and the chemical reaction on which it depends. To remind you roughly of the process, the wall on which the painting is to be executed is first levelled with a coat of somewhat coarse plaster, and then an extremely fine and carefully prepared plaster is got ready: according to modern practice this is made with very carefully and thoroughly slacked lime with fine marble dust. This fine plaster is laid on as a second coat over the other, only as much of the wall being prepared as can be painted in one day, and as soon as it is firm the painting is executed rapidly, the pigments being ground up in water, no medium whatever being employed, the painting being permanently fixed and rendered perfectly waterproof by the setting of the plaster.

You will readily see how this comes about when you consider that the plaster, as applied, consists practically of a solution of calcium hydrate mixed with excess of hydrate in the solid state and the marble dust. When this plaster is spread on the wall, the water of course commences to evaporate, and immediately this happens calcium hydrate is deposited from the saturated solution, cementing together the solid particles already present and causing the mass to "set." Then the mass of hydrate formed gradually combines with the carbon dioxide present in the air, until ultimately the whole mass is converted into insoluble

calcium carbonate. The pigments used in painting being, as I have indicated, laid on the soft wet surface, they become surrounded by the saturated solution of calcium hydrate, with the result that as it hardens in this way they are firmly incorporated in the mass and a permanent painting is secured.

The result is, that in fresco painting we have a process of decoration by means of which pigments are firmly incorporated with the painting ground, and become in fact part of it, without the intervention of any of those organic mediums such as linseed oil, which as we know are by no means unmixed blessings.

It is not my purpose to-night, however, to discuss the merits of fresco as compared with other methods of painting. Both from the artistic and scientific points of view this is a much debated question, on which I hold perhaps unorthodox views. What I do want to draw your attention to is the high state of technical excellence which was attained in the execution of this process by the Minoans in prehistoric times, and the extraordinary extent to which it was applied in the decoration of their houses and palaces throughout Crete.

Previous to the discovery of these paintings you must understand it had been supposed that fresco painting was introduced by the Romans, and that it was not in general use until the dawn of the Christian era. As we have seen, it does not seem at any time to have been known to the Egyptians, and the probable explanation of this is that there was no incentive for them to discover such a process in a country where a painting that barely resists the touch of a damp finger will remain unscathed for 6,000 years.

In Crete it was different—there the climate is more on a par with our own; it is true it is much hotter, and its summer is something better than the English summer at its very best, but it is subject to torrential and long continuing rains in the winter and spring, alternating with the extremely severe winds locally known as "sirocco." Even in summer the condition of atmosphere generally known to us by that expressive word "muggy" is not unknown, and when such a state of humidity alternates with extremely hot sunshine a condition is produced which is very severe on structural work of any kind, and decorative work especially.

It is probable, in fact, that the method of decorating in fresco employed by the Minoans was an outcome of the use of plaster in the first instance as a means of protecting their buildings from the effects of weathering, for we find that they were in the habit of using largely in their buildings a local rock composed entirely of crystalline calcium sulphate (gypsum) which, although extremely beautiful as a building stone, is, as you can well understand, so soft and so freely soluble in water that structures in which it is used decay almost "whilst you look at them."

At a very early period of their civilisation they apparently discovered the use of lime as a plaster, and then they found that by applying pigments to the wet plaster they could colour it permanently in any desired fashion, and from this in course of time they developed the magnificent plaster and the elaborate system of decoration which is characteristic of their later work.

I am not in a position yet to trace out the exact history of the development of this craft from the technical point of view, although I can recognise the main outlines, and it would only weary you to discuss the evidence at length, but I will now describe as briefly as possible its highest development as found in the ruins of the Palace of Knossos, which whilst apparently in the height of its prosperity was sacked and burnt and razed to the ground by some catastrophe concerning which we know nothing, and in all probability never shall know anything. We know for certain, however, that the whole of the vast building was burnt to the ground about 1500 B.C., and that later the inhabitants partially rebuilt it and that finally it was destroyed again and its ruins remained practically untouched until ten years ago.

We know all this, amongst many other things of the most absorbing interest which time will not allow me to speak of to-night, from the abundant traces of fire on the walls and from many of the paintings having fallen from the walls charred and blackened and in many cases unfortunately destroyed beyond recognition. Enough, however, remain in good preservation to reconstruct the art of the time, and also enough to enable us to determine how the decorator set to work.

With the former aspect—the matter of design—I do not propose to deal to-night; the art of the Minoans is far too large and interesting a subject to be dealt with in anything

less than a whole evening, so I will content myself with showing you one or two typical examples of their work. But confining our attention to the technical aspect, the first thing to notice is the extraordinary extent to which plaster was used in those days. The whole house within and without was finished in it. Where the walls were built of rough rubble masonry, this was first brought to a level surface by a first coat of rough lime plaster freely mixed with sand, broken pottery, &c. In the case of squared masonry walls this preliminary preparation was unnecessary, and the final plaster was laid direct on to the stone, previously roughened to give it a key. The thickness of the plaster itself varied according to the circumstances; in some cases it was as much as three-quarters of an inch, in others barely one-quarter, whilst occasionally we find it laid on as the merest wash, just sufficient to hold the pigment. The illustration I now show you represents a section cut through a typical example. You will notice the extraordinary fineness and uniformity of the plaster throughout, and it is really a remarkable material, being of the most brilliant whiteness and very hard, firm, and coherent.

It is rather surprising to find that it is composed of pure lime without any addition, as you will see from the following analysis:—

Calcium oxide	51.93
Magnesium oxide	1.03
Silica	2.12
Iron and alumina	1.81
Carbon dioxide	41.18
Sulphuric anhydride	0.54
Alkali, &c., undetermined	1.39

Of course this analysis is not inconsistent with the possibility of marble dust, which is of practically the same composition, having been added; such an addition is, as I have indicated, considered good practice in modern work, the tradition being derived from mediæval times. But the presence of this is easily detected by microscopic examination, as you will see from the photo-micrographs I now show you, and a series of careful experiments extending over two years has failed to reveal any other material in the original plaster than caustic lime.

I will not discuss these experiments in detail now, but I would like in passing to mention one of the points, which is rather interesting. It struck me whilst I was examining these paintings on the spot that if the plaster was made in this way, the lime of course being obtained by burning limestone, one ought to be able to find somewhere in the neighbourhood a limestone corresponding in composition with the plaster. Now some mile or two from the site of the palace, following the valley of the river, one finds in the side of the rock the entrance to what proves to be an enormous cavern. I will indicate the position of this cave by a series of photographs taken along the road from it to the palace, which incidentally gives you some idea of the scenery of this charming island. No native will enter this cave, about which all sorts of wild legends are extant. Anyone with a knowledge of geology, however, would be puzzled to account for such an enormous cavern on natural grounds, and would be tempted to suggest that it may have been a disused quarry. And so it proved: on entering it one finds oneself in what one can only compare to a vast underground cathedral, a series of immense pillars having been left in the native rock on quarrying so as to prevent the roof from collapsing. These pillars and the walls still retain the marks of the tools by which the blocks of limestone were hewn out close on three thousand years ago. I collected some typical specimens of the stone for examination: here is the analysis:—

Calcium oxide	52.09
Magnesium oxide	trace
Silica	2.22
Iron and alumina	2.18
Carbon dioxide	41.00
Sulphuric anhydride	0.20
Alkali, &c.	0.98
Moisture	1.33

And I think you will agree with me that the agreement is too close to resist the conclusion that here was the source of the lime used for the plaster.

There are many other points of interest in connection with the plaster which I would like to describe, but I must pass on to consider the decoration itself. As one would expect, the pigments used for this purpose are for the most part such as are of natural occurrence. The lime itself gave

white, and yellow was obtained from a fine variety of yellow ochre, the exact source of which I have not been able to identify. Two different tones of red were used, both derived from iron oxide, one prepared by calcining the yellow ochre, and the other by grinding hæmatite; specimens of the raw materials from which this matter was prepared have turned up on the excavations. Black was obtained from a carbonaceous shale similar to that known as Italian chalk, referred to by Cennini and others. The most interesting pigment, however, is the blue, which was a variety of the well-known "Egyptian blue," prepared, as Flinders Petrie has clearly demonstrated by his excavations at Tel-el-Amarna and elsewhere, by fusing copper oxide with sand and alkali—a sort of cupric sodium silicate, in fact. This is a magnificent colour, and it would be interesting to know if it was discovered independently, or whether the Minoans imported the idea from Egypt, or vice versa. There is, however, not sufficient evidence to warrant one in expressing an opinion at present.

These were all the pigments used, and, as I have already indicated, the decoration was executed in the manner we know as fresco. In a paper I communicated to the Society of Painters in Tempera* recently, I recited at length the experimental evidence on which I am able to assert, without hesitation, that this is the case; I will not repeat these arguments here, as they are available for reference, but will now show you a series of photo-micrographs which will, I think, convince you of the truth of this statement. To judge by the huge scale of some of these paintings, and the precision with which they were executed, the work must have been carried out with great rapidity and sureness of execution, and it is evident that the Minoans had a great school of decorative painters, who derived from a long cherished tradition a combination of technical excellence and vigorous design that compares favourably with any period of the world's history. Fresco paintings with them were the regular mode of decoration, and were used as we use wall-papers, and as our ancestors used arras.

When they were tired of the decoration of a room or it became damaged, they hacked over the surface to give a key, and then laid on another coat of plaster and executed a fresh scheme of decoration. Sometimes, instead of doing this, they hacked the plaster right off and started afresh; numerous fragments of such plaster have been found used to level up floors, and incorporated with later buildings, and generally these are some of the most perfect specimens, having been protected from the effects of the fire which, to a large extent, destroyed the paintings in situ at the time of the destruction of the palace. The perfect state of some of these fragments, a few of which I am able to show you to-night, indicates that the decorations were at any rate permanent enough to outlast their use, and this is an important point, because I must remind you that we are speaking of the decorations, not of a tomb, but of a building which was the centre of government and religion of a powerful state.

The paintings of which I am speaking lined the walls and floors of the stately rooms and corridors of this magnificent palace, which must have been daily thronged by multitudes of people from all parts of the then known world, and as such they were subject to conditions comparable with those of the present day. As an interesting example of the stability of this painting, I show you a small fragment which turned up in the first year of the excavations, and was inadvertently left on the top of a wall until it was found last summer. In this exposed situation, alternately drenched with rain and scorched by the sun, it had remained for ten years, and, as you see, to use a colloquial expression, "it has not turned a hair," although under the same conditions modern paint and even woodwork used in reconstruction has perished, and the local building stone has appreciably decayed.

With the decline of the Minoan civilisation, and the transference of power to the mainland of Greece, our knowledge of this branch of decorative work becomes very scanty. How far the Greeks carried on the tradition of fresco painting is a matter for further investigation, and I am not in a position as yet to give you any conclusions as to their methods. We know, mainly from the statements of Pliny, that they introduced a new method of decoration, that of encaustic, or painting in melted wax. This process has received considerable attention by Dr. Launie, and is discussed at length in his recent book,† which collects all the

* Published in the *Journal of the Royal Society of Arts*, January 7, 1910.

† *The Materials of the Painter's Craft*.

evidence there is concerning this most debatable period, which I propose to pass over with this brief reference. Throughout this time, however, of course Crete was still occupied, and it was, in fact, a most important centre of art in the golden age of Greece: to mention one example, some of the finest coins the world has ever seen were those struck at Phaestos, a district on the south side of the island, which was the site of another important palace in Minoan times.

Coming down to the time of the Roman Empire, we find that an important town existed close to the site of Knossos; in fact, the foundations of the Roman houses rest on those of the outlying houses of the Minoan town surrounding the palace. In the photographs I now show you of the excavations of this area you will see the remains of a Roman villa built above the foundations of a Minoan house. The date of this villa cannot be stated with certainty, but it is probably somewhat anterior to the destruction of Pompeii, and you will notice that the decoration of the walls is carried out in plaster. Whether the process was handed down to this period or introduced by the Romans I am not prepared to discuss at present, but it is certain that fresco was as important a method of house decoration as in the early times of the Minoans.

There are, however, distinct differences in the details of the process, and it is interesting to compare the work of the two periods on the same spot. The Roman work here compares very closely with that of Pompeii, which, as you are aware, was carefully covered up and preserved in A.D. 79 in order that we might be able to obtain an accurate knowledge of Roman life and work in the middle of the first century. (That is the way one is tempted to regard the disastrous eruption of Vesuvius at that date.)

The process of working employed at this time was investigated by Sir Humphry Davy as far back as 1815, and my own observations confirm his conclusions. The wall was first rendered with a lime concrete composed of lime mixed with an aggregate of small pebbles, and on this surface the decoration was executed, the plaster used being composed of a mixture of lime, marble dust, and pounded brick or volcanic lava, this being laid on in a thickness of only about three millimetres as a rule. The painting was executed in fresco, as has been clearly proved by many experimenters from Davy onwards, finishing up with myself. I have here some specimens from which you will be able to judge for yourselves. One hears from time to time various statements as to how the celebrated paintings of Pompeii were executed, made by those who are content to surmise rather than face the somewhat laborious process of practical investigation.

As far as my own experience goes, we may dismiss all such stories as that the Romans were in the habit of using a laborious process involving the application of some thirty or forty coats of some preparation of casein, as what is described by Shakespeare as "the baseless fabric of a dream." There is no doubt that they were executed by trained artisans who covered square yards once and for all in a single day, although both as regards design and technical skill they were far inferior to the Minoan craftsmen at their best.

I would like to add a caution in passing as to the danger of judging such work, from the technical point of view, by what you see in museums. If you examine the Pompeian paintings preserved in Naples Museum, or for that matter the Minoan work in the Museum at Candia, you will come to the conclusion that they were painted in wax. This is because they were impregnated with wax in what Dr. Evans happily describes as "the days of King Minos the Terrible," that is to say, that they were subjected to this preservative treatment by zealous museum officials.

Remains of similar plaster work are found wherever a Roman site is investigated, showing that it was the customary mode of decoration. There are numerous examples in the Forum at Rome, and I found traces of it at the Coliseum.

It is interesting to note that it was extensively practised in this country in these times and proved eminently practical, as is evidenced by numerous remains in good preservation. Some very interesting examples of Roman fresco work are to be seen in Colchester Museum, for example. Some of these illustrate very well the practice of overlaying the fresco with another to which I have already referred. We can obtain a fair idea of the domestic life in England at the time the Romans abandoned the country to its fate, from the buried city of Silchester, near Reading, which has now been entirely explored and mapped out. By way of conclusion, I show you a few photographs taken during the progress of these excavations. Only the foundations of the

houses are here standing, but amongst the débris formed by the falling of the ruins are found numerous fragments of fresco, showing that they were decorated in a manner similar to that employed at Pompeii some 400 years earlier.

With the fall of the Roman Empire the standard of civilisation and consequently the practice of the decorative arts suffered another period of decline. To trace out its history through this dark period and the subsequent rise through mediæval times, culminating in the traditions and practice of to-day, would take me far too long and trespass too much on your patience. Moreover, my mandate to-night was to discuss the decorator in ancient times, and, having done that to the best of my ability, I will bring these remarks to a close.

THE CONCRETE INSTITUTE.

AT the sixteenth ordinary general meeting of the Concrete Institute on the 6th inst. at Denison House, 296 Vauxhall Bridge Road, Westminster, S.W., Sir Henry Tanner I.S.O., F.R.I.B.A., the President, occupied the chair.

A paper entitled "Swanscombe Ferro-Concrete Pier" was read by Mr. C. Percy Taylor, Assoc.M.Inst.C.E.

The gradual development of the Associated Portland Cement Manufacturers' Swanscombe works since the commencement of their rotary plant in 1899 has resulted, said the author, in a very large increase in the capacity of the works, and necessitated considerable enlargement of the wharves, more especially for the loading of cement into steamers and sailing ships direct.

The most important point was the provision of a deep water L-shaped concrete pier, with a frontage of 130 feet and having a depth 17 feet at low water and 37 feet at high water (spring-tides).

Owing to the wharf being situated about three-quarters of a mile from the works, the cement, whether in sacks or casks, has to be transported from the warehouses to the wharf in covered wagons. It was necessary, therefore, for these wagons and the locomotives to go direct on to the pier. The wagons weigh when fully loaded ten tons, and the wheel base is 4 feet. The locomotives weigh twenty tons, on a wheel base of 5 feet. To provide for all contingencies it was decided to design the pier to carry the maximum number of locomotives or wagons which could possibly be put on it. In calculating the bending moment of the beams and slabs, all live loads were increased by 50 per cent.

The foundations consist of thirty-two columns, which except at the corner, were constructed in pairs on 25-foot centres, the pitch longitudinally being 28 feet. Each pair of columns is connected just above low-water level by a horizontal brace and at the top by a cross-beam. Between the last three pairs of columns at the outer end of the pier there is in addition a reinforced diagonal strut. Except at this end of the pier, however, it was considered that the I shape of the structure as a whole secured sufficient stability and in actual practice this has proved to be the case.

It was ultimately decided to restrict the loading of vessels almost entirely to the down side of the approach and the outer face of the pier.

Experimental borings showed that the bed of the river consisted of a thick layer of mud overlying ballast with chalk below, and that a good footing for piles was not likely to be reached at less than 60 feet to 70 feet from the deck level of the pier. For this reason it was desirable to use a construction which involved a minimum of long piles. The other chief idea underlying the designs adopted was the desirability of carrying the full diameter of the columns right down to the bed of the river without necessitating the deposition of concrete through water. In the author's opinion the practice frequently adopted in similar structures of depositing concrete inside a shell through a considerable depth of water down a shoot produces a concrete of very questionable strength. A case recently investigated, where a very poor piece of concrete was found near the top of a column, clearly showed that when the concrete was poured down the shoot into the cylinder a large proportion of the cement had been washed out and floated to the top, where it collected as a layer of cement and mud without cohesion or strength, owing to each particle setting before forming into a mass; the result was weak concrete at the bottom of the column and a mass of individually set particles of cement at the top. Bearing in mind, therefore, the desirability of depositing as little concrete as possible through water, a system of constructing the columns was worked out, in which the concrete carrying the weight of the structure was

in the form of blocks moulded on shore and matured before being placed in position.

In the general arrangements for constructing the pier the main idea was the avoiding of false work—the working platform being supported entirely on the permanent structure previously completed. Six heavy pitch-pine baulks about 70 feet long were carried on timber framings supported at first on the wharf and later on the top of the completed columns. The overhanging ends of the baulks were stiffened by raking struts, which rested on a cross timber attached to the base of the columns just above low water, and reached to another cross timber underneath the ends of the baulks. The main timbers were so placed that the blocks of the columns could be lowered between them. A scotch crane was erected over the backs of the long baulks.

The design of the columns provided for blocks laid one on the other surrounding a central pile, the blocks being keyed together by a recess and projection, and also by rails passing through vertical holes around the central pile. The blocks were further strengthened by $\frac{3}{4}$ -inch round rings of about 4 inches less in diameter than the block built in about every 8 inches. The only concrete which had to be deposited under water was that used for filling around the pile and the rails. The quality of this was not of such great importance as that of the mass of the blocks.

The central pile alone was not sufficient to support the total weight to be carried by each column—about 150 tons as a maximum—but on the other hand the carrying of more than one pile through the column would have necessitated either a very large diameter or else a block with very little solid material in it. It was therefore proposed to rest the base of the column on some additional piles driven round the centre one and cut off at about ground level. In order to secure ample rigidity for the connection between the piles and the column, the bottom blocks were made in the form of a hollow shell. These were firstly made in a reinforced concrete throughout, in the belief that the bed of the river would be sufficiently soft for them to be forced through the upper layers to form a key. Experience with the first few columns, however, indicated that this was not the case, and afterwards the sides of the shells were made of steel plate fixed to the reinforced concrete top. To further increase the rigidity of the column base a hollow was grabbed out in the bed of the river at the site of each column, so that the top of the shell-block actually came about level with the bed of the river, the hollow being afterwards filled with concrete in bags.

The driving of the additional piles and the cutting of them off at the level of the ground was a simple enough operation in the first few columns above low water, but it would doubtless have proved costly both in execution and labour when working in deep water. It was therefore decided to try a system of dollying them down to a dead level, and this was found by experience to work very well indeed.

The next operation was the placing of the longitudinal beams, which were all of identical design. These were moulded on shore and lifted into place by the crane, being temporarily supported on rolled steel joists going right across the pier on each side of the column tops, these being hung from needle beams. The steelwork was, of course, removed as soon as the cross-beam and floor were set, the joists being used several times.

This arrangement saved a large amount of heavy shuttering which would have been necessary to mould the beams in place, and also avoided the use of falsework to support the shuttering. As a matter of fact, for the construction of the pier itself only three temporary piles were driven. These were for the extra heavy beam forming the chord at the corner.

After the placing of the nine longitudinal beams, the crane and other plant were moved forward for the building of the next pair of columns, and the moulding of the main cross-beam and stiffener was taken in hand. The shuttering for the main cross-beams was of the simplest possible kind. The base was laid direct on short cross-bearers supported on the main rolled steel joists. The side shuttering in place of the end cross-beam was formed in bays each of five pieces, which were hinged together. The middle piece was rather shorter than the distance between two longitudinal beams. The side pieces were each about 18 inches—to form the end of the longitudinal beams—and the intermediate pieces were about 2 inches long and hinged to each of the others, so as to form an adjustable fillet. This shuttering could be fixed in place in a very few minutes, and without any cutting or fitting whatever, any slight variation in the spacing of the beams being met by an alteration in the

angle of the fillet, which was, of course, quite immaterial. The stiffener was formed in a similar manner, but the bottom shuttering for this had to be slung from the longitudinal beams.

The shuttering for the decking was carried on timbers bolted to the longitudinal beams through small holes especially left for the purpose. All bays—except at the corner—being alike, the shuttering was used over and over again without any alteration whatever.

Considering the design of the pier as a whole, objection may be raised that the idea of making the various portions on shore and connecting them together *in situ* is not consistent with the monolithic idea underlying reinforced concrete design. The author does not, however, consider that any such criticism is valid, in view of the fact that no structure of such a size can be said to be built in anything but small parts in actual practice, and that the divisions often occur where it happens to suit the foreman to cease his day's work, no provision being made to deal with the special stresses which may arise at the points of junction. In the structure described, all stresses occurring at the junction of old and new concrete were specially considered. At the points where the longitudinal beams were joined up to the projections from the cross-beams which formed their ends, the surface of the beams was very carefully cleaned and roughed, and, as the concreting of the cross-beams proceeded, the old concrete was carefully grouted over, but in addition to this precaution there was as a matter of fact sufficient steel in the section of the beams at this point to take the whole of the shearing forces. The forces needing consideration at the top surface of the beams as moulded have already been dealt with in detail above.

With even less rigid precautions than were adopted in this case, the author feels that the manufacture of separate members in the way indicated is amply justified where the work may be more simply and cheaply carried out by that method, and that where shuttering is specially expensive and difficult the method might well be adopted a good deal more often than it is at present.

At the conclusion of the paper a discussion was opened, in which the following took part:—Mr. F. E. Wentworth-Sheilds, M.Inst.C.E., Mr. E. P. Wells, J.P., Mr. Oscar Faber, B.Sc., Stud.Inst.C.E., Mr. Alfred Brooks, and Mr. W. G. Kirkaldy, Assoc.M.Inst.C.E.

It has been arranged for the members of the Concrete Institute to visit the International Building Trades Exhibition at Olympia on Monday, May 1, and in connection with the same the first of a course of six educational lectures under the auspices of the Concrete Institute is to be delivered by Mr. R. W. Vawdrey, B.A., Assoc.M.Inst.C.E., M.C.I. The other five lectures will be given in the Lecture Hall of the Concrete Institute at Denison House (close to Victoria Station), 296 Vauxhall Bridge Road, Westminster, S.W., on consecutive Wednesdays, May 3, 10, 17, 24, and 31. The lectures will commence at 5.45 p.m., admission being free to the public by ticket obtainable on application to the Secretary, Mr. H. Kempton Dyson, Denison House, Westminster, S.W.

NOTTINGHAM ARCHITECTURAL SOCIETY.

THE annual meeting of the Nottingham Architectural Society was held on Tuesday, April 4.

The chair was taken by the President, Mr. R. Evans, junr., F.R.I.B.A.

Two new associates were elected.

The Council reported that the membership now consisted of two honorary members, forty-three members, and thirty-six associates. During the past year two associates had resigned, one member and five associates had been elected, and five associates had been transferred to full membership, making a total of eighty-one, a net increase of four on the previous year. The report also mentioned the result of the visit of Messrs. Hubbard and Cross from the Royal Institute, and urged that it was most desirable in the interest of the profession that all eligible architects should apply for admission to the Royal Institute, either as associates or licentiates, in order to support the proposed Registration Bill. During the winter session interesting papers had been read by Messrs. E. R. Sutton and A. N. Bromley, and the Designing Club had held five meetings.

The average attendance at the general meetings was thirty-two, a decided increase on previous years.

Better attendances and more interest had been shown in the Designing Club attached to the Society.

The Council had revised a scale of professional charges, and these would shortly be issued to the members in practice.

The statement of accounts showed that the financial position of the Society was sound. All subscriptions had been paid, and there was a balance in hand of 711.

Mr. R. Spencer, the Hon. Librarian, reported that he was overhauling the library, with a view to preparing a classified catalogue. There were now eighty-two books in the permanent library, some very valuable ones, and fourteen in the loan section. The library depended largely on the generosity of the members for its additions, and he was pleased to report that during the past year Messrs. R. Evans, jun., A. E. Heazell, A. N. Bromley, W. P. Betts, and R. Whitbread had given several valuable and useful books. They were also greatly obliged to the professional papers and other societies who kindly sent copies of their publications for the reading-room. He was pleased to say that the books in the library had been in more demand.

Mr. W. H. Swann, the Hon. Sec. of the Designing Club, reported that the number of designs sent in for competition was slightly more than the previous year. He hoped the associates would realise the great advantage of submitting designs for criticism and being able to criticise the designs of others, and not be deterred from sending drawings because of a little adverse criticism. There had been five subjects set, and the attendances had been satisfactory. They were greatly obliged to the older members who helped to make the meetings useful by their presence and hints. The following were elected officers for 1911-2: President, Mr. R. Evans, jun., F.R.I.B.A.; vice-president, Mr. E. R. Sutton, F.R.I.B.A.; members of the Council, Messrs. A. N. Bromley, F.R.I.B.A., A. E. Heazell, F.R.I.B.A., H. Gill, M.S.A., F. W. Gregory, H. G. Watkins, A.R.I.B.A., A. Dale, and R. Spencer; hon. sec. and treasurer, Mr. F. M. Royle, A.M.Inst.C.E.; hon. librarian, Mr. R. Spencer; hon. sec. to the Designing Club, Mr. W. H. Swann, A.R.I.B.A.; hon. auditors, Messrs. A. J. Holbrook and H. A. Dickman, A.R.I.B.A.

It was decided to have a summer excursion in July, the arrangements being left to the Council.

THE ARCHITECTS' BENEVOLENT SOCIETY.

THE annual general meeting of subscribers and donors was held at No. 9 Conduit Street on Tuesday afternoon last. In the absence of the President, Mr. Leonard Stokes, the chair was taken by Mr. H. L. Florence. Amongst those present were Mr. T. M. Rickman, F.S.A., Mr. William Woodward, Mr. Rowland Plumbe, Mr. Lewis Solomon, Mr. A. Saxon Snell, Mr. W. Hilton Nash (hon. treasurer), and Mr. Percivall Currey (hon. secretary).

The following annual report of the Council for the year 1910 was received and adopted:—

"The Council, in submitting their sixty-first annual statement, have to report that the sum of 727*l.* 15*s.* has been distributed in eighty-six grants, while the further amount of 250*l.* has been paid to the Society's pensioners, thus making the total sum expended in relief 977*l.* 15*s.*

"Although thirteen new subscribers have been enrolled, the total amount received in subscriptions was below that of the previous year; the actual figures being 702*l.* 0*s.* 6*d.*, as against 709*l.* 9*s.* 6*d.* received in 1909, without including the sums received for subscriptions in arrear or for those paid in advance. Among the new subscribers, the Council have the pleasure to mention the Manchester Society of Architects for 5*l.* 5*s.*, while the Leicester and Leicestershire Society of Architects have increased their annual subscription to the same amount. The falling off in the total amount has been occasioned by the large number of subscriptions which remained unpaid at the end of the year, notwithstanding repeated applications. Many of these overdue amounts will no doubt yet be received; but the Council wish to point out that the consideration of deserving cases would be greatly facilitated if the general body of subscribers were to realise their responsibility with regard to prompter payment. Subscriptions are due on the 1st January.

"The amount received in donations and bequests has fallen much below the average, being, for instance, 109*l.* 15*s.* as against 300*l.* 6*s.* 2*d.* received in 1910. As, however, a credit balance was carried over from the Capital Account (to which all donations and bequests are placed), an investment was made in the purchase of 200*l.* Queensland 3 per cent. Inscribed Stock at a cost of 172*l.* 6*s.*, while at the end of the year the sum of 128*l.* 0*s.* 2*d.* remained in hand.

"Donations have been received from Mr. Leonard Stokes, 21*l.*; Sir William Emerson, 15*l.*; The Merchant Taylors' Company, 10*l.* 10*s.*; Mr. Graham C. Awdry, 10*l.*; Sir A.

Brumwell Thomas, 5*l.* 5*s.*; Mr. Walter Cave, 5*l.* 5*s.*; The Arts Lodge, No. 2751, 5*l.* 5*s.*; Mr. Victor A. Flower, 5*l.* 5*s.*; Sir Lawrence Alma-Tadema, 5*l.*; Mr. Archibald M. Dunn, 5*l.*, and many smaller amounts.

"The Society during recent years has suffered from the death of many of its most generous supporters. The Council greatly regret to add that this number was increased last year by that of Mr. John T. Christopher. Mr. Christopher was not only a generous contributor to the Society, he also took as a member of the Council on many occasions, an active interest in its administrative and philanthropic work, to the consideration of which he was always willing to devote his energy and time. The Council highly appreciate an intimation which they have received from the members of his family, through Mr. Freville Christopher, that they wish to contribute a hundred guineas to the Society as a tribute to his memory.

"The following, being the five senior members, retire by rotation from the Council:—Mr. Benjamin Ingelow, Mr. Henry Lovegrove, Mr. Rowland Plumbe, Mr. William Woodward, and Mr. Arthur Ashbridge. To fill the vacancies caused by these retirements the Council have the pleasure to nominate Mr. T. E. Colcutt, Mr. George Hubbard, Mr. E. B. I'Anson, Mr. A. Saxon Snell, and Mr. W. L. Spiers.

"The thanks of the Society are due to the Royal Institute of British Architects for office accommodation and to the staff of the Institute for their always helpful courtesy in any matter connected with the Society."

Votes of thanks to the five retiring senior members of Council having been passed, the following were elected for the Council:—President, President of the R.I.B.A.; Mr. Charles J. Blomfield, Mr. John Borrowman, Mr. C. R. Baker King, Sir Charles Nicholson, Bart., Mr. G. E. Bond, Sir A. Brumwell Thomas, Mr. Walter Cave, Mr. F. W. Hunt, Mr. Reginald St. A. Roumieu, Mr. Lewis Solomon, Mr. Thomas E. Colcutt, Mr. George Hubbard, Mr. E. B. I'Anson, Mr. A. Saxon Snell, and Mr. W. L. Spiers.

Mr. William Glover (Past President of the Northern Architectural Society) and Mr. T. M. Rickman, F.S.A., were elected Vice-Presidents.

Votes of thanks were proposed and carried to Mr. W. Hilton Nash (Hon. Treasurer) and Mr. Percivall Currey (Hon. Secretary). Both these officers were re-elected.

A vote of thanks was passed to the auditors, Mr. A. Saxon Snell and Mr. C. H. Brodie. For the ensuing year Mr. C. H. Brodie and Mr. Henry Lovegrove were elected to act as auditors.

A vote of thanks was passed to the R.I.B.A. for the use of meeting room; and also to Mr. H. L. Florence, the chairman.

The meeting terminated with a warm vote of thanks being proposed by Mr. William Woodward to Mr. R. Dircks (assistant secretary) for the way in which he conducted the business of the Society.

ILLUSTRATIONS.

PUGIN STUDENTSHIP DRAWINGS.

CONTINUING our series of examples of work submitted by competitors for the Pugin Studentship, 1911, we this week illustrate selections from those sent in by Mr. J. B. Mendham.

LLOYDS BANK, VICAR LANE, LEEDS, AND HUNSLET, LEEDS.

WE herewith illustrate the exteriors and interiors of banking-room of two banks recently erected in Leeds from the designs of Mr. Sydney D. Kitson, M.A., F.R.I.B.A., the President of the Leeds and Yorkshire Architectural Society.

"WHITE HORSES" AND CAST FROM OLD WORK, CHRIST CHURCH COLLEGE, OXFORD.

ON this plate we give examples of modern and ancient sculpture. "White Horses," by Mr. F. W. Doyle Jones, was exhibited at the Royal Academy in 1909. The piece of old work at Christ Church College was discovered recently.

EXTENSION OF SHOP AND HOUSE, COPPERGATE, YORK.

HIS example of provincial street architecture is the work of Mr. W. T. Whincup.

THE ILLUMINATING ENGINEERING SOCIETY.

(Concluded from last week.)

THE LIGHTING OF SCHOOLS.

FOLLOWING the reading of the papers we have already reported, the following discussion took place:—

Mr. R. S. Clay (Principal, Northern Polytechnic) spoke as a representative of the Association of Technical Institutions. Experiments had been made at the Northern Polytechnic with inverted arc lighting, and difficulties had been encountered from the carbons being placed the wrong way up so that the light was not reflected in the desired direction. A satisfactory light had been obtained by arranging the lamps about 4 feet or 5 feet from the ceiling. With inverted arcs, a great deal of light was lost, and consequently in certain rooms he had replaced them with 100 candle-power metal filament lamps, as these were found to give a better distribution for certain purposes. Inverted arcs were specially suitable in drawing schools, because they were almost shadowless. They were also found to be very good in the masonry shop, and also in shops where bright reflecting surfaces were being used. Referring to Dr. Harman's paper, he suggested making use of the distinctness test for estimating candle-power. His instrument maker had made him a small instrument by which he had been able to tell distinctly the amount of light in different parts of a room. It consisted of two pieces of brass arranged like a pair of scissors, one of which had a V cut and the other a circle. By rotating them over each other the V was cut down, and it was possible to estimate the light by the aid of a scale. With regard to Dr. Harman's remarks as to upright and inverted gas mantles, he had tried the latter and found them very much better.

Mr. C. A. Baker (London County Council) pointed out that a standard illumination for class-rooms was rendered impossible through the rooms being used for so many different purposes. In ordinary schools it was the evening class accommodation that had to be considered most of all, and it was a somewhat difficult problem when they had to adopt one kind of lighting which was at all times economical, and yet had to answer many different purposes. The use of 25 volt lamps suggested by Dr. Hickman introduced the question of prime cost of the installation. If a very large number of small points had to be put up, the prime cost would be too high in many cases. He thought they had solved the problem of getting a cheap installation and a satisfactory light at the Haverstock Hill School. This school had only been opened a few months, but it was one of a large number of schools that had been wired during the last few years. During the past five years he had had occasion to light 6 colleges, 4 secondary schools, 18 elementary schools, and 2 special schools, making 30 in all, and some valuable experience had been gained. He was adopting 50 candle-power lamps for the schools as the standard, and for a school to accommodate 900 children the cost was 300*l*. The total candle-power installed was 7,500, and the price per candle-power installed 10*2d*., the candle-power per child's place being 7½. The Council's statistical officers put the number of school children at 886,000, so that the illumination was about 7,000 candle-power to light up the County Council schools at the present time.

He agreed with Mr. Dow that a different order of lighting was required for trade schools. For instance, where seamstresses were learning, and working on dark cloth, one or two foot-candles would be quite unsuitable; five or six foot-candles would be nearer the required amount, and he hoped representatives of other schools than the County Council's schools would speak with regard to this. In the London County Council schools the lamp ends were frosted, and the globe used was a deep one, measuring 14 inches by 6 inches, and the top of the shade was open to let out the heat so that the flexible cords lasted longer. Nobody had given a reason for lighting from the left, but his own suggestion was that it enabled one to avoid reflection from the book surface, which was very noticeable when facing the light. The systematic marking out of lamp positions in relation to the position of the desks as suggested by Dr. Harman did not take place in practice. The desks were usually rushed in at the last moment, and sometimes the lights too, and there was no time to go along the desks and mark out the positions of the lights and fix them. The positions had to be fixed a very long time beforehand in such positions as could be judged were the most suitable from the information to be gathered from the officials who were interested in the matter. In any event, it was always a little bit difficult to find the

best positions in a room that was to be used for different purposes.

Mr. P. J. Waldram, F.S.I., said that as an architect, and as one who had been endeavouring to study the subject of daylight for some years, he desired to tender Dr. Kerr his personal thanks. As Dr. Kerr pointed out, quantitative measurements of the small proportion of daylight enjoyed by interiors was absolutely useless. It varied from month to month, from day to day, and from hour to hour by several hundreds per cent. without materially affecting the usefulness of the light. It might vary in a class between 9 A.M. and 3 P.M. by 300 per cent. without affecting the convenience of those using the light, and in fact without their being conscious of anything but a nice comfortable light the whole time. The human eye had been taught by countless ages of outdoor experience to reduce all excess of daylight illumination down to a moderate level, and it only complained when it was subjected to a glare or when it was called upon to work under those conditions of insufficient light which to our prehistoric ancestors heralded the period of darkness when work had to cease. In addition to the diurnal and seasonal variations, daylight also varied curiously according to the state of the sky—a snowy day in December might be brighter than a wet day in June; slightly cloudy sky gave much more light than clear blue sky, &c. Any attempt, therefore, to measure the daylight of interiors by measurements of the light at any period would be like trying to value the good will of a retail business by counting the number of customers in the shop at a particular moment. The measurements of projected sky area described in the paper are equally untrustworthy. He had measured many rooms, from every part of which an ample sky area was visible, which enjoyed a splendid aspect, but a wretched illumination, and which required artificial light on the slightest provocation. On the other hand, there were rooms (like some of the Law Courts) in which practically no sky was visible, but which enjoyed a good light almost up to sunset on a dull day. This was because the light was reflected from the paper at a high angle; light striking the paper at a low angle did not enter the eye at all. The light of a class-room could be tested roughly by ascertaining whether at, say about an hour after sunrise and half an hour before sunset on a clear day, a good reading light was enjoyed at the worst desk. This was the only test possible to the unaided human eye, and it had serious disadvantages. In the first place, one must either wait for a clear day and be at the class-room exactly at the right time, or else make a proper allowance for the elevation of the sun and the state of the sky. This latter demanded a high degree of skill and experience. Photometrically, however, the daylight illumination of every desk could be rapidly ascertained by comparing it with the illumination of a small portion of the zenith sky. This could be effected by reducing the illumination falling upon a Trotter photometer by means of a ten-inch tube having an aperture which was a certain proportion of the area of a ten-inch hemisphere. This method of measurement originally devised by Mr. Trotter was extremely simple, easy, and speedy. One could measure every desk in quite a large school in an hour or so at almost any time of the day or the year because the proportion of light enjoyed by any interior was constant over all ranges of outside variation. It had recently been recommended in the annual report of H.M. Chief Inspector of Factories for determining the sufficiency of the lighting of underground workshops. The illumination enjoyed by a desk depended upon a large number of factors, such as the state of walls, ceilings, and glass, the height of window heads, and especially the angle at which the light came. These factors were all allowed for in such a proper relative quantitative test and if a number of schools known to be good, bad, or indifferent could be systematically tabulated, it should not be difficult to arrive at a certain minimum standard for the worst desks in the room. Personally, he would be inclined to place that standard at about one-thousandth of the outside illumination measured from the zenith sky at a time when the sun was not either shining directly into nor was being directly reflected into the class-room. It was almost essential that the illumination on the desk should be measured on a surface placed on the actual working slope, and it must be viewed from the natural angle for reading and writing, because a desk and its paper or book might receive quite a large amount of low angle light, but that merely illuminated the scholar's chest; it did not reach the eye naturally, and was a direct temptation to a cramped position. So vitally important was the question of high angle light that he would be inclined to sacrifice a great deal in order to illuminate class-rooms by top lights, and suggested that lantern lights with flat

ceiling lights would overcome many of the difficulties. When top lights were impossible as in the ground floor of two-storey buildings, he would prefer to raise the sill level and to increase the area of the upper portions of the window until the window walls were practically a glazed frieze, broken only by the minimum amount of brick piers required to support the wall and floor above.

Mr. K. Edgcumbe (Messrs. Everett, Edgcumbe & Co.) exhibited a photometer of the Wingen type, in which the standard took the form of an electric lamp instead of a flame. He considered the electric standard had many advantages over the flame standard, the latter taking a long time to settle down, whilst there was the difficulty of having to turn the flame up and down in order to adjust the balance illumination. This must upset the candle-power for some considerable time. There were also difficulties in reading with the flame standard, it being impossible to get nearer than 10 to 15 per cent. when reading the distance between 20 and 30 degrees. In addition to having an electric standard, his instrument was made with an adjustable screen worked by a milled head. The instrument could be laid upon a table or anywhere else, and after adjusting the illumination by the milled head, it could be read off in foot-candles. The instrument also had a daylight attachment.

Mr. E. S. Mortimer, who said he welcomed the advent of the illuminating engineer in connection with school lighting, mentioned an instance in which a so-called engineer had placed all the heating apparatus on the side of the school-room where the windows were, rendering it necessary to open the windows owing to the moisture upon them, and incidentally losing all the heat. That engineer was not an expert, and that was why he welcomed the intrusion of the real lighting expert.

Dr. H. R. Hickman referred to his experience with a Wingen photometer. He marked a school-room out into squares, and found the illumination in each square, but before he got halfway across the room the whole of the light had altered, and he gave it up as absolutely hopeless. He found it impossible to get round the room in half an hour or less. With regard to reflected light from the surface of paper, this was very noticeable when electric lighting was first introduced, and very bright lights were placed high up. It was most painful to sit under and read, especially if the paper was shiny. A roughish paper was best, as it gave off a diffused light.

Mr. T. Abbott spoke as a technical teacher, not in a London County Council school. He had experienced nearly every one of the faults mentioned during the discussion, and the Society would earn the gratitude of technical teachers who did all their work by artificial light, if it would turn its attention to the peculiar conditions under which they laboured. Blackboard glare was a very serious matter; for there was always a percentage of the students who could not see anything on the blackboard due to this cause. For some years the only light in the room in which he was working was a big central light containing four incandescent lamps, which gave very big shadows under the light. There was no light in the corners, and half the blackboard was in glare. There were also one or two fishtail burners over the blackboard and there was some doubt as to where the glare came from. By arranging brown paper screens over the central light the glare on the blackboard completely disappeared. He suggested that it might be possible to improve the lighting of blackboards by the use of tubolite along the tops, provided the light was properly shaded from the students.

The President proposed a hearty vote of thanks to the authors of the papers, and the discussion was adjourned.

A NEW VIEW OF ROMAN LONDON.*

By REGINALD A. SMITH, F.S.A.

AT the present day little excuse is needed for introducing to a London audience any new evidence with regard to town-planning and traffic regulation; for though the present Paper deals with London as it was nearly two thousand years ago, it is meant to illustrate the manner in which the engineering genius of Rome laid down the main lines of traffic in this part of Britain.

Britain was in contact with Roman civilisation a century before the conquest under Claudius, and that period of respite sufficed to show the natives whom they had to fear, and the best means of defending their shores and estuaries against a

surprise attack. Till recent years the attainments of the ancient Britons have been strangely underestimated, and without exaggerating their capacity we may assume that their standard of civilisation was little below that of their Romanised neighbours across the Channel.

To watch the river it was necessary to have a regular roadway on high and dry ground as close as possible to the water, and this was practicable only on the north bank near London. East of the Lea, and a good way beyond London on the south, the banks would be useless for such a purpose; and it is interesting to find the remains of an ancient road running east and west on the brow of the hill just above what is now London Bridge. When that road was first engineered we can only surmise, but it was certainly built or rebuilt by the Romans. The position, however, suggests an earlier British origin, and if this road were to enable horsemen to patrol the river and give notice of any hostile approach by water, then we must imagine it continued, at least westward, along the brow of the steep northern bank, and crossed the Walbrook, which was at that time a broad tidal river running into the Thames at Dowgate Hill. Its subsequent course would be quite conjectural were it not for the occurrence of three Roman burials that exactly indicate a line that is more than probable on other grounds. If the theory holds good a line drawn between these sites should indicate the course of a Roman high road, and the only line that satisfies the conditions runs from Bridge Street, opposite the foot of Pilgrim Street, through the Temple, under Somerset House, between this hall and another hall in the Strand, past the National Gallery on the north (and higher) side of Trafalgar Square, under George III.'s statue and the Waterloo monument, across the south side of St. James's Square and the west end of King Street to enter St. James's Park a little above the bandstand, whence still in a straight line it would follow the high ground to the Tyburn valley. Crossing the stream—no doubt by a bridge as the banks are somewhat steep—it would, in a few yards, reach the south end of Park Lane, and Hyde Park Corner has always been an important landmark. Nor need we give up hope of following it still further, for though connected with the Thames it could not well have crossed the low and then swampy ground south of Knightsbridge; but a road was practicable on fairly high ground to Brentford, which there is reason to believe was the objective of this ancient highway. The former importance of this town may be partly explained by a ford over the Brent and by the fact that here is a stretch of gravel in the Thames bed which made it possible to ford the river at low tide in the days before steamboats rendered a deeper channel necessary. A few years ago Mr. Montagu Sharpe convincingly argued that here was the spot where Cæsar crossed the Thames, and the existence of a large number of stakes in the north bank is in full agreement with Cæsar's own account of the crossing. For him there was only one ford, and that a difficult one, to take him into the territories of Cassivellaunus, and here, if anywhere, would be a British stronghold reached by well-kept roads. The supposed road from Brentford to Hyde Park Corner is practically in the same line as the section from the latter point to the Fleet, and in my opinion both belong to a system elaborated by the ancient Britons for their own safety and convenience. It may be remarked in passing that the road west of the Fleet, which seems to be marked out by the burials with mathematical precision, exactly coincides with the Terrace of the Inner Temple. The whole group of buildings is evidently based on that line, while the Strand frontage is ignored; and if the Terrace is, in fact, a remnant of this early highway overlooking the Thames, the curious alignment is easily explained.

The advantage secured to the Britons by this road would also appeal to the Romans, to whose engineering skill and thoroughness may be attributed the straightness and stability of this secondary highway. Another road of more importance may also have been laid out before the Roman Conquest, but its length and directness point unmistakably to Roman initiative, and at least near London may, without much hesitation, be assigned to the latter half of the first century. Here, as in other cases, a clue to the original course of the road may be gained by producing the straight lines that still exist outside London, but a word of caution is necessary as to the name of Watling Street. In Kent there is no ambiguity, but in the Metropolis the presumed original highway of that name must be clearly distinguished from the street that runs east from St. Paul's to Queen Street. The latter will be discussed in another connection, but at first the Roman highway from the Kentish ports to Chester seems to have avoided the city and crossed the Thames at Westminster, and

* Abstract of a paper read before the Royal Society of Arts.

a straight line in continuation of the fine stretch of Roman road on Shooter's Hill skirts the river at Deptford, crosses the Thames a little south of the present Westminster Bridge, and reaches the southern end of Park Lane, where it may be presumed to have turned into the line of Edgware Road; for a prolongation of that road would almost coincide with Park Lane, and naturally stop at what we have already supposed to have been an important road-junction. This, at any rate, is the solution suggested by a consideration of outer London, and by the observance of the Roman rule that roads run straight unless turned aside by serious obstacles. The Edgware Road is an excellent example, running in a straight line till compelled to swerve in ascending Brockley Hill; and the onus of proof lies on those who would make the Roman roads crooked without weighty and sufficient reason.

In the fourteenth century, when there were probably clearer traces of the Roman highway than there are to-day, there lived a monk named Higden who was connected both with Westminster and Chester, and had therefore probably travelled over great part of the Watling Street. In the *Polychronicon* he described this road as crossing the Thames to Westminster and beyond, westward to a point at which it turned towards St. Albans. That is at least what I consider a fair reading of the text which has been variously translated and interpreted.

From the map it is fairly obvious that Park Lane represents a southern continuation of the Roman road that practically coincides with Edgware Road, and from the elbow in Piccadilly we may suppose the road ran in a straight line to Brockley Hill. Nor is this a mere supposition or tradition; the actual road was struck in 1902, almost exactly in the middle of Edgware Road, opposite Seymour Street. Another discovery, unhappily not so precise, seems to shed fresh light on the intersection of Roman roads at the Marble Arch. In Rocque's map of 1746 is marked the position of a stone against which condemned soldiers were shot inside the Park, civilian criminals being executed at Tyburn gallows just outside. It was described as a Roman "geometric" stone, that is, a stone set up as a landmark by road-surveyors, and probably inscribed with distances to various points. The intersection near the Marble Arch of two important Roman highways (the original Watling Street and that from Romford to Staines) would fully account for the position of the stone which, on the map, lies in the middle line of the avenue.

The east-and-west road is characteristically Roman in its defiance of minor obstacles and adherence to the straight line, but did not actually pass through Roman London. It led from Essex across the Lea to Holborn, along Oxford Street and Bayswater Road over Notting Hill to Brentford, where it joined the British highway already noticed, and thence to Staines and across the Thames to Silchester and beyond. Though its course through Essex and west of Holborn is fairly well established, the intervening portion that skirted the north wall of the city is more conjectural, and it is only in the last few years that indications of the line have been noticed. Even without this fresh evidence, one could guess at its position by producing the line that is fairly clear from Romford to Stratford Town Hall, and this would pass through Old Ford, under Bishopsgate goods station, Finsbury Square, and Smithfield to Holborn Viaduct. Beyond this the direction is slightly altered, but another long stretch takes us in a straight line to Notting Hill.

The two main roads that remain to be considered seem to have met on the Thames bank at a spot always of special importance to London, and probably the site of the first wharf on the north bank of the river. To determine this point we may first produce the lines of recognised Roman roads in the suburbs and then test the accuracy of the method by a survey of the archaeological and historical evidence.

From Ware southwards to Edmonton there can be traced on the map a line that is continuous with the recognised Roman road that coincides with the highway from Edmonton through Tottenham and Kingsland to the city, and the presumption is therefore that the Roman north road from the Thames ran straight from the river at least as far as Ware. Its course would have been under the old Custom House, a little to the east of the present building, and about 100 yards west of the Thames subway at the Tower. Opposite this is the point where the line of Roman road known as Ermine Street, on the Leatherhead Downs, would, if produced, strike the Thames, and this coincidence strengthens the belief that these roads were intended to join at a recognised river-crossing where the Romans doubtless erected a bridge on the site of what seems to have been the lowest ford on the river in British times. It is true that a distance of sixteen miles, between the track on Leatherhead Downs and the river, has

to be covered by conjecture, except for a fragment of the road at Ewell; but if the straight line was preserved over such difficult ground as the Downs above Mickleham, it may justly be inferred that no deviation would occur on the lower ground towards London, and that the point aimed at on the river was in a line with the surviving remnant on the Downs. Some such connection must be found between these two portions of the Ermine Street (called Stane Street between Chichester and Dorking, and deflected by Box Hill), and the course suggested is not only the most obvious but is supported by a certain amount of archaeological evidence.

That the Romans built a bridge to carry their high road across the river at or near the point towards which earlier British roads must have converged, is more than probable.

In support of this theory mention may next be made of Stoney Lane, which runs parallel to, and a few yards east of, the Ermine Street on the south bank. This is an ancient name, and may have arisen from a paved approach to the river at this point, corresponding to Stanegate at Lambeth. There is also a Stoney Street opposite Dowgate, which has led some writers to put the crossing here, in spite of the fact that the Walbrook was then a broad tidal river. About seven furlongs south of the river the road would cross the Watling Street, and in the angle thus formed a large Roman cemetery has been discovered in the burial-ground of a chapel (now Salvation Army barracks) in Deverell Street, New Kent Road; and burials in a similar situation have been noticed at Smithfield.

North of the river the problematic course of Ermine Street is fairly marked out by the burials in Artillery Lane and Bishopsgate Street Without, Goring Street (formerly Castle Street in Bevis Marks), Fenchurch Street, Mark Lane, and All Hallows, Barking; and Billiter Street with Mark Lane may represent the ancient line. But this line is probably not so ancient as the others. It is a curious fact that this route to the north is not mentioned in the "Antonine Itineraries," a military road-book of Britain of somewhat uncertain date, but, in its original form, attributed by the latest writer on the subject to the first decade of the third century, the name being presumably derived from the Antonine Emperor Caracalla (A.D. 198-207). Travellers wishing to reach the north were in that work directed to use the Romford or the St. Albans road for the first part of what was a roundabout journey, and we can safely conclude that the road through Ware was not then in existence. In any case the direct route passed through marshy country on its way to Lincoln, and seems to be the last link in the road system round London. On the other hand, a road, which to all appearance started from the same point on the north bank of the river, seems to have been constructed at a comparatively early date in the Roman period, though no trace of it is to be found in the "Itineraries," no doubt because it was at first merely a branch road. Evidence has already been brought forward to show that the wall round London dates from the end of the third or some time in the fourth century, and the occurrence of burials flanking this road indicates that it was laid out before the building of the wall. East of the Walbrook burials are rare within the wall, but beyond that stream they are plentiful along the line in question; and it is difficult to believe that the Roman authorities would have tolerated burials in that area after the wall was built. Though some of the burials date from the first or second century, there are others with the unburnt body that seem to belong to the period after the change from cremation to inhumation, which, in my opinion, took place about A.D. 250. The houses near St. Paul's, in one of which fourth-century coins were found, would, on this hypothesis, not have been built till the burial-ground was disused and perhaps forgotten, presumably after London became a walled city.

A glance at the map will show that a road was wanted to communicate with the great north-west highway known as Watling Street for conveyance of goods, not to mention troops, from the principal landing-place in London. This end would be served by the road suggested between the Custom House, where it would join the Ermine Street, and Newgate, where it would unite with the east-and-west road and cross the Fleet by one and the same bridge. In this way the detour by Westminster would be avoided; and even if the Ermine Street was in existence when this road was planned, a good mile would be saved by traversing one side of the triangle instead of joining the east-and-west road at Norton Folgate and traversing the other two sides.

This road is marked out as well as any by the burials, and though not a continuation of any known Roman highway, has actually been found about the middle of its course. This line would link up interments in King William Street.

Cannon Street, Cheapside, St. Paul's Churchyard, Paternoster and Warwick Squares, Old Bailey and Newcastle Street, and though the first two sites might be explained as abutting on a still earlier British road, the rest are obviously connected with the Customs House-Newgate road, which has other points of no less interest. Its sloping course leads gradually up the steep river-bank and joins the presumably British road in front of Cannon Street Station. It is just at this point that London Stone originally stood, in the middle of the road about 35 feet south-west of the recess in St. Swithin's Church wall, where a fragment is preserved; and it may well be that the stone stood at the intersection of two roads as the firmly-set "geometric" stone seems to have done at the Marble Arch. The history of London Stone has been traced back for many hundred years, possibly to the tenth century; and it has always been regarded as of monumental interest. Its mediæval history need not detain us; but it is important to notice that when its massive foundations were unearthed by Wren after the Fire, they seemed to him to have formed part of some public building; and tradition has it that this was the mile-stone from which all distances were measured in Britain.

The two roads that met in Cannon Street would probably cross the Wallbrook by a single bridge and part company again on the western side; that on the north passing along Budge Row and crossing Queen Victoria Street between two churches, St. Mary Aldermary, and St. Antholin (now demolished). Excavations in 1869 revealed a road at a depth of 10 feet 3 inches at this spot, nearly in a line with the present Watling Street. For a short distance west of this point our line runs along Watling Street, where it has been found, and the name is more or less appropriate, as this road probably superseded to a large extent the Westminster portion of the Watling Street from Kent, when London had risen into importance. Its connection with St. Paul's Churchyard is indicated by another discovery by Wren. "Upon demolishing the ruins after the last fire and searching the foundations of this Quire, the surveyor discovered nine wells in a row; which, no doubt, had anciently belonged to a street of houses that lay aslope from the High Street (then Watling Street) to the Roman Causeway (now Cheapside); and this street, which was taken away to make room for the new Quire, came so near the old Presbyterium that the Church could not extend further that way at first." A similar row of wells abutted on the Roman road in Cannon Street.

There is another record of flint pavement about 13 feet from the surface, below two layers of burials on the north side of the east end of St. Paul's, and below the pavement fragments of "Samian" ware, evidently of the second century. The remarks on Roman burials near St. Paul's apply still more forcibly to the few found within the walls on the east side of Wallbrook, as in Crooked Lane, on the site of East India House and at St. Helen's, Bishopsgate. On the last site a marble cist was associated with a coin of Constantine II., which might indicate a subsequent date for the building of the Wall; but the point is that no burials seem to have been found in a well-defined rectangular area roughly bounded by the Wallbrook on the west and by Cannon Street on the south. Gresham House would be about the middle of the north side, and the east would be in a line with East India Avenue. It may be accidental that London Stone is at one angle of this enclosure, which has an area of about fifty or sixty acres, closely corresponding to that of a legionary camp. The prætorium or headquarters of such a camp would approximately coincide with the site of St. Peter's, Cornhill, under which massive Roman walls have been found extending westward to St. Michael's Church and eastward under Leadenhall Market. In the opinion of Roach Smith and other well-known antiquaries these were connected with an important public building, and an apsed building resembling a basilica was found under the market. Close by, at the cross-roads, probably the Carfax of London mentioned in two ordinances of Edward III., stood the Cornhill standard, a fountain of such importance as a landmark that distances on milestones throughout England we are told were measured from it as from the heart of the city. There is, therefore, some ground for considering this point the centre of Roman London. The city developed, I suggest, from a legionary camp, no doubt occupied in force at the very outset of the Roman conquest and possibly later by legions on the way to the front, but soon given over to a civil population, which rapidly made it the leading commercial city of the province. It is interesting to note in this connection that St. Peter's claims to be the first Christian church in Britain, and certainly ranked higher than a parochial church in the Middle Ages, for its school was one of four maintained by order of

Parliament in London. Its foundation by Lucius in the second century is, no doubt, fanciful, but there may be some justification for the claim that it was the seat of a bishop or even archbishop in the Constantine period.

There is certainly one, and perhaps more than one, main road in or near London that awaits discovery, but perhaps those already traced will have given pause to the critical historian or archaeologist. To those accustomed to the haphazard road system of modern London, the straight-edge may seem a crude and inadequate instrument for restoring the main routes of the Roman period; but our conquerors had practically a clear field and were addicted to straight roads, even in districts where they found greater natural obstacles than near London; and there are coincidences that seem to confirm the system above described. Other critics may consider that too much stress has been laid on the discovery of burials more or less in line, and may point to several burials in the London area not so arranged and presumably independent of any main road. To these I would reply that interments have been occasionally found in Britain in close proximity to Roman villas, away from main roads, and the erection of tombstones along a main thoroughfare may have appealed more to the well-to-do than to the humbler members of the community, who would be content with an unostentatious burial close at hand.

It is, from the archaeological point of view, regrettable that no Roman cemetery has been thoroughly excavated and recorded in Britain, and that we have to look abroad for much of our evidence of date. Years of patient work at Silchester, for instance, have placed before us a Roman provincial town with realistic effect, but the most useful piece of work there is still undone; the burials of its Roman and perhaps British inhabitants are still unexplored and even undiscovered, and the only consolation is that they are still intact. The records of such discoveries in London are provokingly inadequate, but they have at least been collected and examined, I hope to some useful purpose; and the results obtained may, perhaps, direct attention to this period of our city's history, and rescue from destruction any similar relics of the past that may hereafter come to light.

Sir G. LAURENCE GOMME, F.S.A., the Chairman, opened the discussion. It was, he said, a great thing for Londoners to have an official in the British Museum wholly devoting himself to work of this kind, and devoting himself in a way which showed that he built up his theory, and it was an extraordinarily elaborate theory, from a very long series of observations involving a tremendous amount of research. He himself (Sir Laurence) was one of those holding that Roman London was really the basis of modern London, consequently any research which brought out information as to Roman London must be of the greatest importance. To Mr. Montagu Sharpe's researches must be added the important paper just read. He would, however, like to raise a small protest against one fallacy. Mr. Smith had seemed to base a great deal of his theory on the assumption of ancient British civilisation. There was absolutely no necessity to imagine a pre-existing British road in order to account for Roman roads. It was true that the early Britons had coins and even works of art. But anthropologists know that the Maoris of New Zealand have elaborate works of art; but that does not prove that they were civilised. He would remind Mr. Smith that the Celtic Britons were in the condition of tribesmen, as was shown by the fact that their post-Roman laws were tribal laws. It was not, therefore, likely that they would build roads. Mr. Smith might better have begun his research with Roman roads. The extreme importance of Westminster to London was not its British but its Anglo-Saxon position. The author's theory was that the Romans buried at all events their principal people on either side of the roads leading into their cities. When one considers how London has been dug into and altered and changed, it was remarkable that there were not so few but so many Roman burials in London. To have gone over the map of London and to have selected those burial places as the sites of Roman roads seemed to him a very extraordinary piece of work. When the route of these roads was confirmed by other evidence, it seemed as if they might take Mr. Smith's theory as proved, though he must say that when he saw Mr. Smith's ruler going across other roads he felt rather alarmed. It did not seem safe to neglect the evidence of a modern road when it might help to settling the position of a Roman one. The identification of the Roman camp destroyed by Boadicea was of extreme importance, and afforded an extremely interesting example of Mr. Smith's method of research. It was true it was based on the negative

vidence that burials were not found within that particular sea; but that evidence was very strong, and seemed to be worthy of the greatest consideration. Mr. Smith's paper was one of the most ingenious he had ever heard.

Mr. MONTAGU SHARPE said that he knew of Roman burials considerable distance away from the lines laid down. He would like to know if the author confined his burials to the insular and military roads, or whether he included burials alongside local roads.

Mr. H. B. WHEATLEY characterised the paper as one of the most remarkable contributions to our knowledge of the subject which it was possible to imagine. In looking at the map, one must be struck by the number of early Roman roads, and it was hard to understand what they could want with so many. It appeared to him that the idea of a road with a ridge being built at Westminster in place of one in London was rather extraordinary. It seemed impossible for a bridge to have been built at one time and then to have been so completely lost that the town was content to be without any but London Bridge until the eighteenth century. The point was certainly arguable. The theory gave a shock to one's feelings like that caused by Sir Walter Besant's book, where he made out that Westminster was an earlier town than London. The reason why there was no growth at Westminster was because of the swampy ground. As there was a part of Roman London in Southwark, it did not seem as if the ordinary idea of going across from Southwark to London would be correct. As to the matter of a bridge, it was, of course, a very important point of Mr. Smith's argument that it was built by Britons. But the latter would have difficulties which would not be such to the Romans. For the Romans it was not a question in building a bridge that it should be at the shallowest part of the river, but at the narrowest.

Mr. WILLIAM PAGE (editor of the "Victoria History of London") said that a light was thrown on the question of the early importance of London by the author's remarks as to the course of Watling Street crossing the Thames at Westminster and going on to St. Albans. The goal of Cæsar's invasion was Verulamium, and when Claudius invaded this country, the only spot which the Romans made into a "municipium" was Verulamium. Hence it was the most important town in southern Britain, and probably the most important in all Britain. London first came into prominence through the insurrection of Boadicea, when it was coupled with Verulamium and Colchester. Towards the end of the first century London became of much more importance than Verulamium. Mr. Smith had mentioned that Stane Street from Chichester must have been made about A.D. 300. If that were the case, might not that have been the date of Roman London Bridge?

Mr. T. F. ORDISH pointed out that they knew when London was rebuilt it was rebuilt on the old ways, the alignment of the roads being very much the same. There was, however, an important difference between the lines drawn by the lecturer and those which have hitherto been supposed to be based upon the Roman system. Mr. Smith had indeed given a new view of London, and a most interesting one.

Mr. REGINALD SMITH, in reply, said, the Chairman had maintained that he had exaggerated the standard of civilisation among the ancient Britons; but every year new evidence was turning up, and more might be expected. Until thirty years ago no attention was given to the civilisation of the period. The little they knew about the early Britons should lead them to give the race the benefit of the doubt. There was certainly a Roman settlement at Thorney. Mr. Lethaby had told him that more discoveries had been made during the last few months under Westminster Abbey, including fragments of pavement 3 inches thick, as well as of roofing tiles under the apse of the Confessor's church. When making Queen Victoria Street they found a Roman road about 20 feet from the surface, opposite the Mansion House station. Under the spot where St. Paul's Cross now stands several burials were discovered. Probably the Roman villa at the corner of Cheapside was erected after the Roman cemetery had been forgotten and the site turned into building land. It was not surprising to find there were burials and cemeteries outside London, and not connected with roads at all. London was the key of the road system, just as it is to-day of the railway system. London hardly existed in the first century. Even after it had become an important commercial centre it is quite possible that the roads went through Westminster, just as a railway makes an avoiding line outside a busy centre so that trains can go past the town instead of through it. He felt certain that the Romans did join up the north and south roads by a bridge. London Bridge was heard of in the reign of Edgar. If they did not build it, who did?

UNIVERSITY OF LONDON LECTURES ON ARCHITECTURE.

LEAVING Early Christian churches, with which he had dealt for the last two weeks, Mr. Banister Fletcher took as the subject of his lecture at the British Museum on Tuesday, March 14, the architectural character of the Byzantine style, dating almost contemporaneously with Early Christian work, but developing on totally different lines, and having a strong influence on subsequent architecture, more especially on the Later Renaissance, an influence felt even to this day.

The evolution of the dome on pendentives is essentially a Byzantine feature, developed by the Romans at Byzantium when they came into contact with Eastern methods.

Hitherto the dome had only been used over circular and in one or two cases over polygonal compartments, but the characteristic of the Byzantine dome is that it is placed over a square compartment. The Greek, or Orthodox Church, ever since the separation with the Church of Rome over the "Filioque" question, has adhered to the Byzantine style, which is also to be found in Eastern Europe. The Greek Church in the Moscow Road, also the Roman Catholic Cathedral at Westminster, designed by the late John Bentley, are two modern well-known examples.

There was no great break in constructional methods when Constantine removed his capital from Rome to Byzantium, which had been an old Greek city, but where Greek tradition in the matter of craftsmanship was still very strong. This, naturally, had a very great effect in the development of the style especially felt in the execution of the ornamentation, but Roman methods still continued. Walls were of concrete, lined with brick, or entirely of brick alone, faced with coloured marbles from one inch to an inch and a half in thickness, the slabs being opened out and carefully arranged in order that the veining should make symmetrical patterns over the wall surface, which was thus formed up into panels.

Monolithic columns from all parts of the Empire were used in immense quantities, the bronze rings found at the necking and base serving to prevent the shaft from splitting, since the marble had to be cut in its length and set up contrary to the direction of its natural bed.

Owing to the hot sunny climate, windows remained small.

The Iconoclastic movement in the eighth and ninth centuries is felt to this day in the Greek Church, where all statuary is excluded, and only pictorial images permitted.

In the reign of Justinian a great revival in building took place. S. Sophia (Hagia Sophia = Divine Wisdom) at Constantinople was erected by his command on the site of two former churches of the same name—the first, the basilican church erected by Constantine in 350 A.D., and the second erected by Theodosius in 415 A.D.

The Byzantine style continued at Constantinople until 1453, when the city became the capital of the Turkish Empire.

The style, besides being adopted entirely in the East and remaining characteristic of the Greek or Orthodox Church, spread westward, owing to the trade route through Venice and the Byzantine influence at Ravenna already mentioned. Examples are found in France, and the Church of S. Front, Perigueux, is practically a copy of S. Mark's, Venice, in its architectural character, though it lacks the mosaic treatment to its walls.

The central dome over a square compartment is the chief feature in the Byzantine style, the eye being carried up to an elevated point, and not ranging along rows of columns supporting horizontal entablatures, as in the trabeated Greek style. This dome was not the sole feature, though the most prominent, for it was usually surrounded, often supported by smaller domes or half domes, as at S. Sophia, where the thrust of the big dome is taken by two semi-domes on the east and on the west.

The Church of S. Sergius and Bacchus, with its melon-shaped dome, shows the return to the true constructional use of the column, characteristic of the style. Entire columns, usually monolithic, were once more used to support internal galleries, and not merely for the decorative purposes to which the Romans had for the greater part put them. S. Sophia at Salonica, dating from the sixth century, and S. Theodore at Constantinople, are other examples which the lecturer dealt with.

He then proceeded to explain the principle of the dome on pendentives, and the second, or compound, form which it took later, viz., the raising of the dome upon a drum in which windows were placed to admit light to the interior, a feature seized upon and developed by the architects of the Renaissance period.

The Byzantine dome presents the same appearance externally as internally; that is to say, its outer surface is shown and not hidden by a timber roof.

The openings are either square-headed surrounded by architrave mouldings, like Roman openings, or sometimes circular-headed.

Windows are comparatively simple, light usually being admitted by a ring of windows in the base, or the drum of the dome, or grouped in the gable ends of the building. An example was shown from S. Mark's, Venice.

Stained glass was not used, the interior depending on the mosaic ornamentation for its colour.

The columns no longer supported an entablature, but arches springing direct from the capital, in the design of which a form of the Ionic volute was retained; the Roman capital was also used with the dossier block, as explained in last week's lecture.

The Greek tradition is strongly felt in the craftsmanship of these capitals, as seen in the spiky form of the acanthus and in the deeply-drilled lobes of the leaves. The unending knot, signifying unity, was a very favourite form of ornamentation.

A peculiarity in Byzantine decoration is that the carving is all contained within the outline of the capital, and is, as it were, below the surface, and not in front, as in Greek and Roman work.

A billet moulding usually divided the marble panels which lined the walls or separated the marble lining from the mosaic treatment; otherwise, very few mouldings were used, the bases of columns being generally plain.

S. Vitale at Ravenna was next described, and the Church of S. Sophia at Constantinople. The latter was built by Justinian in the years 532-537, the architects being Anthemius of Tralles and Isidorus of Miletus.

The great central space 107 feet square is crowned with a dome having the same diameter, and supported by four piers 25 feet wide and 65 feet long.

The thrust of the dome is taken east and west by two semi-domes, with smaller domed exedrae abutting upon them.

North and south the thrust is taken by the immense piers or buttresses, which extend as far (north and south) as the semi-circular domes east and west, thus bringing the whole to a square on plan measuring north and south 237 feet and east and west 265 feet, owing to the exedra of the eastern apse.

The church is approached by an atrium and an inner and outer narthex. North and south are aisles over 50 feet wide.

The pendentives which support the dome project over 20 feet from the wall, and are the largest pendentives in the world.

The interior is richly lined with marble and ornamented with mosaic. A ring of forty windows in the base of the drum admits light to the interior.

As seen from the outside, the Turkish tomb houses and minarets are somewhat misleading, as they appear almost to form part of the building.

THE RUSTING OF STEEL INSIDE A CONCRETE COVERING.

ON Thursday, March 9, an ordinary meeting of the Concrete Institute was held to discuss the draft report of the Science Standing Committee on "The Rusting of Steel inside a Concrete Covering." The President (Sir Henry Turner, Kt.) occupied the chair. The essence of the report is as follows:—

Mr. F. E. Wentworth-Sheilds, who presented the report, said that at the beginning of 1909 the Science Committee knowing that there was a great deal of hesitation among engineers and architects about using reinforced concrete owing to the fear that it would deteriorate, and that the steel would rust away, and would cause the reinforcement to fail sooner or later, determined to investigate the matter. They made up their minds to find out whether such deterioration really did take place; whether in course of time steel did rust inside a concrete covering, and if so under what circumstances it took place. They made it their object to, if possible, lay down a set of rules which, if followed, should obviate any such mishap. He would like to say as a preliminary remark that the duty of this investigation was entrusted by the Concrete Institute to its Science Committee, under the chairmanship of Mr. William Dunn, and that

in itself would he thought assure them that the investigation had been undertaken quite free from any sort of prejudice. They had tried as far as possible to get at the real truth of the matter. Although the Institute was composed, to a large extent, of gentlemen who were interested in reinforced concrete and who wanted to see it established, still they felt it was their first duty to make quite sure that their enthusiasm for reinforced concrete did not carry them away and blind them to any defects it might have. Therefore they made a special point of trying to look at the matter from a wholly unprejudiced point of view—to look at the weak points as well as the strong ones, and they spared no pains to ascertain cases where deterioration had taken place as well as to find out those cases where reinforced concrete had been a success. The Council thought that the report was really a matter of such great importance that it would be well to lay it before the members to give them an opportunity of discussing it instead of merely printing it in the Society proceedings. He supposed one of the principal reasons why English engineers and architects had been nervous of using reinforced concrete was that they feared that deterioration might take place, that the steel inside would rust, and the structures so erected would be in trouble before they had been up many years. Therefore he thought it was impossible to overestimate the importance of the enquiry, and he felt sure that the members would like to hear what the Committee had done and discuss the conclusions at which they had arrived. Mr. Wentworth-Sheilds then read abstracts from the report.

Mr. William Dunn said the Science Committee had gone to a very great deal of trouble to elicit information on the subject they set out to investigate. The Science Committee recognised that there had been failures, and their main object in making the enquiry was not to elicit information as to success but as to failures; that they might find out where they were so that they might see them and form some opinion upon the cause of the failures. Broadly speaking, the Committee had come to the conclusion that the failures were preventable, inasmuch as they arose from causes which they could control. He quite sympathised with the fears of many who thought that reinforced concrete was a dangerous material because they could not see the steel. It was said that in a bridge the steel could be seen, and then if rusting took place it could be either repaired, replaced or painted or it could be taken away altogether, but in reinforced concrete work that could not be done, and the material on which they depended for their stability might rust away and lead to sudden disaster, such as happened at the Charing Cross Station some years ago. He did not think they need fear such an occurrence with reinforced concrete, for it should be remembered that the steel would not rust away without producing an expansion of the material which tended to burst the concrete. At the Southampton Docks, which were visited by the Committee, wherever the rusting was taking place it was accompanied by bursting or fractured concrete. That should satisfy engineers that if rusting was taking place the damage would be apparent. The Committee had endeavoured, and he thought successfully, to be impartial in their report, and not to take any biased or partial views. In speaking of old examples of reinforced concrete there was an example not much known which existed in London, near Islington Green. It was built by Philip Bransen. He (Mr. Dunn) visited that building some time ago, and while he could not visit it internally, it was evidently a reinforced concrete building of very considerable age—probably it dated from about the year 1870. It showed cracks across it, particularly in the sides between the window-heads and the sills. That was the trouble with reinforced concrete, and when those cracks were not attended to they looked alarming. When they came to look into the cracks they meant very little. They must learn to discriminate between the cracks which were dangerous and the cracks which were not dangerous. He did not see any particular remedy in sight for these cracks which were merely disfiguring; he thought, however, they knew how to avoid cracks which were dangerous. In France the Committee discovered many examples of reinforced concrete work which they were very astonished to see by reason of the degree of finish which they had got. He thought probably that when our people here got more accustomed to the material we should get the same high finish as they got in Paris. The building in Lincoln's Inn Fields, which the Committee had reports upon, was a very interesting example of reinforced concrete work. He was invited to go and see it at the time the building was being pulled down, but unfortunately he did not take advantage of the opportunity. He had previously inspected the building in

company with the architect, and it certainly was an extremely interesting example and one in which he thought reinforced concrete was in a very excellent condition.

Mr. Laurence Gadd, F.I.C., said he thought the report was a most interesting one, and he was thoroughly in agreement with the conclusions at which the Committee had arrived. Speaking broadly, they had come to the conclusion that under normal circumstances reinforced concrete structures were perfectly stable provided reasonable precautions were taken in the making and the placing of the concrete. Personally, he was very much interested in that portion of the report which dealt with the danger arising from stray currents of electricity. Published results showed that even small currents might have serious effects. He had not seen the jetties at Southampton upon which the Committee had reported, but he had examined some of the specimens and thoroughly agreed with the Committee that the danger was probably attributable to electrolytic action. Recently Mr. C. P. Taylor and himself had been conducting some experiments, and although they were not nearly completed, the results so far obtained were, he thought, of sufficient interest to warrant his giving a short description of them. The method of the experiment was to imbed a $\frac{3}{8}$ inch rod of iron inside a solid cylinder of concrete. The concrete was composed of three parts Thames ballast, two of fine flints, one of building sand, and one of cement. A current of electricity which was carefully regulated to 1-10 ampere was continuously passed through the blocks; the blocks themselves standing in sea water, about three-quarters of their height being immersed. The experiments were commenced on the 10th of last month. On the first day the anode block was found to have the surface stained for a considerable distance round the rod. Gas was evolving and the rod forming small bubbles. In the cathode block gas was given off rapidly from the immersed surface, especially on the side facing the anode block. The following day the anode block showed black and red stains which covered the whole surface of the top and extended down the side to the water which was much discoloured with iron rust. A quantity of ferro oxide was found on the bottom of the tank. On the cathode block a white substance was found on the immersed portions. The next day the anode block showed a small crack near the top and it was thickly coated with black and red oxide. As time went on the symptoms were aggravated for about ten or twelve days. On the 20th he broke the blocks open, and the appearance of the reinforcement was very curious. The concrete was very hard and very difficult to break open. The anode block was eaten away at the surface of the concrete. The oxide scale extended an inch down, but the concrete was stained a yellowish colour about two inches down into the body of the block. That tended to show that where they had a continuous current of electricity of 1-10 ampere almost immediately within an hour or two they had rusting of the reinforcement. They were now repeating the experiments with some modifications. The most interesting modification was that the experiments would be carried out under the same conditions only they were passing an alternating current of electricity through the blocks in place of a continuous current. The experiment had been going on for about ten days, and so far no rusting appeared to have taken place. He had one of the blocks cut open that day and found the rod perfectly intact and the concrete did not show the slightest trace of rust.

Mr. C. S. Meik, M.I.C.E., said he thought the report of the Committee was very satisfactory, as it would allay the fears of many engineers and others in this country as to the safety of steel inside concrete. Having worked with concrete for forty years he had never had the slightest doubt about its safety, and when he took up reinforced concrete work he never had any fear of rusting taking place provided the concrete was properly made. In his opinion safety was only a question of making the concrete properly. His experience showed him that the heavier they got their concrete the more impervious it would be; and he would strongly advise members of the Institute to get a concrete that weighed at least 150 lbs. per cubic foot irrespective of steel work. He had had a substance lately brought before him called "Ironite," which had been used in America and tested in this country. That was a material which if laid on the concrete or mixed with it made a practically impervious mixture and prevented any water getting in. With regard to the corrosion which the Committee found at Southampton Quay, he was entirely at one with them in the conclusion they came to—that it was the result of electrolytic action caused by the

electric current finding its way through the ground to the steel work.

Mr. D. B. Butler, A.M.I.C.E., remarked that he wished to add his word of thanks to the Science Committee for the valuable report they had published. He regarded their conclusions as extremely important, and he thought the report should at last lay at rest the old bogey that rusting occurred inside properly made concrete. He thought it might be accepted as a fact that with properly made concrete rusting could not occur. Some of the instances given in the report where failures had taken place owing to the steel rusting were very interesting. In one case he noticed that the steel was badly rusted, and the cause was ascribed to the concrete being made of coke breeze. Unfortunately, there was no information at hand as to whether it was real coke breeze that was employed or whether it was material that was commonly called coke breeze. Some of them might be aware that he (Mr. Butler) read a paper before the Society of Architects as to the use of breeze in concrete, and he there mentioned that nowadays breeze had come to mean almost any kind of furnace refuse, and there was no doubt that some kinds of that breeze were extremely dangerous to use for concrete. Another case of failure was ascribed to insufficient punning, and to the fact that the rods were not washed with cement grout. His experience taught him that it was not always necessary to do that; in fact, it was best not to do so unless it was done immediately.

Mr. D. G. Somerville remarked that it was of the utmost importance that this question should be thoroughly investigated, because this matter of rusting was practically a daily matter of conversation amongst engineers and architects. He was very interested in what the report had to say about the Town Quay at Southampton. He carried out a second contract there about three years ago, and in connecting the new dock to the old they had to cut away the concrete, and when they opened the work the steel rods were found to be totally unaffected.

Mr. E. P. Wells said he could only repeat what he had said at meetings of the Institute before, viz., that so long as there was a proper covering to the steel it did not matter whether moisture got in or not. Under such circumstances he had never known of oxidation taking place, but if they allowed air to get in, and with it possibly sulphur, then of course oxidation would occur. If their reinforcement was made with good coke breeze the steel inside would not oxidise, but if it was made of compounds which were called breeze which contained a lot of ashes and clinker, they could not depend upon it. There were cases under such circumstances where oxidation had not occurred, but he should say that in 99 per cent. of such cases where the ordinary breeze compound was used mischief was bound to take place. Wherever they got a proper cover, and the concrete was good and free from sulphur, there was no doubt that steel and concrete would last—well he would not say for ever, but it would last sufficiently long for this generation and the next, and he should say for another generation on the top of that.

Mr. Alfred Brooks, J.P., said that speaking as a manufacturer he wished to say how warmly he welcomed the report of the Science Committee. He was sorry that Mr. Bamber was unable to be present, because he had taken a great deal of interest not only in the work of the Committee but in the whole subject. This question of the possibility of the rusting of steel in reinforced concrete work was not confined to this country. In January 1907 he was present at the opening of the fine new buildings of the American Society of Engineers in New York, and he was introduced to the chief engineer of the Edison Power Company in that city. He asked him (Mr. Brooks) if he knew whether the reinforcement rusted, and he told him that as far as their experience of it went, they had not discovered any such action. He told him that he knew of many cases where they had had to cut up old work and that they had always discovered the steel or iron which was imbedded in the concrete to be in the very best possible condition. He then told him (Mr. Brooks) that the roofs of the power house of the Edison Power Company, which was also used as a tank for water, very shortly after it was built showed signs of serious corrosion taking place. He (Mr. Brooks) told the chief engineer that he was very surprised to hear that, and suggested that possibly electrolytic action might explain what was taking place, and he promised to make investigations to ascertain whether he could find anything similar going on in any of their own works in this country. To that end he had caused careful enquiries to be made at their various electric-power houses where they had reinforced concrete work in the immediate proximity, and in no case could they

find any such action going on. He wished to say that none of the buildings were situated in damp places. Apparently they needed to have the concrete in the neighbourhood of water, where the electric current would have a tendency to run through the concrete. At their own works at Northfleet, some two years ago, they cut into a reinforced concrete chimney right down to the reinforcement, to see if under such circumstances any corrosion had taken place, but in no case could they find any corrosion going on in the reinforcement. Wherever they were able to cut it open they found the steel in perfect condition. Generally speaking he could confirm the conclusions of the Committee—that where there was no electrolytic action they need fear no damage whatever to their reinforcement, assuming of course that it had been carried out in a satisfactory manner and that they had not left voids, so that the cement itself was still in contact with the steel.

Mr. W. G. Kirkaldy, A.M.I.C.E., said it had been his good fortune never to find any rusting in the steel of reinforced concrete work all the years he had had to deal with it. In his opinion it was all a question of care in the filling in of the concrete. If the material was properly proportioned, and well put in, he could not see that any rusting could take place, except of course, from electrolytic action.

The President said he thought their thanks were due to the Science Committee for the great care and trouble they had taken to produce their report. It seemed to him that there could be no doubt that steel was perfectly satisfactory if it was imbedded in a sound concrete. It ought always to be so imbedded, but often it was not, and that was where the trouble came in. He thought, however, that everybody was getting more and more accustomed to making a sound concrete and that they were not likely to run the risk which they formerly did. They had made some experiments, including the placing of some columns of reinforced concrete in the pond at St. James's Park, where they had been for several months, and on examination they showed no signs of rusting.

Mr. Wentworth-Sheilds, in replying on the discussion, said it had been extremely interesting, because it had showed that on the whole the members present agreed with and appreciated the report which the Science Committee had laid before them. Mr. Gadd's experiments were extremely interesting, and he was sure they would all look forward to hearing of his further results with great interest, and perhaps he would give them the benefit of those results in the form of a paper at a later date. The Committee felt that they had not thoroughly investigated the question of electrolytic action. It was a matter that wanted to be looked into very carefully, and of course it was difficult to make a report on any subject absolutely final and perfect. This report of the Science Committee was only an interim one, but with the exception that they did not quite know the extent of the danger from electrolytic action, he thought they had cleared the field. They felt they had been able to absolutely lay down proper precautions, which, if taken, removed all fears of deterioration. Mr. Meik's remarks about the density of concrete were extremely interesting. He (the speaker) was sure he was quite right in what he had said, but it must be borne in mind that the rule would have to be subject to modification sometimes. While a heavy concrete was desirable, it was not advisable to have too large stones—in fact if they wanted their reinforcement to be durable, the finer the aggregate the better. Mr. Meik had also referred to a new substance called "Ironite," and had told them how desirable it was to get something which would make the concrete impervious. The Committee had considered the desirability of adding some material—in fact a coating of tar was suggested for protecting marine work, but it was felt that people might not like using tar, and so it was thought best to say nothing about the material, but simply to lay it down that in certain cases it was desirable that the concrete should be covered with some impervious coating as an extra precaution. Mr. Wells seemed to think that it did not matter whether moisture got in or not, provided that the concrete was well made, and that therefore it did not matter whether it was impervious. He (the speaker) did not want to answer that point himself, but he thought the view of the Committee was that moisture should certainly be discouraged. No doubt there were places where the concrete could be moist and the steel not suffer, but of course directly they got anything like electrolytic or chemical action then the presence of moisture made that action more virulent, and it was for that reason that the Committee emphasised the necessity for making the concrete non-porous

and avoiding any circumstances which would tend to make it damp, because although the reinforcement might not suffer owing to the damp, it was better to keep it out. In conclusion, he wished to say that it was very gratifying to the Committee to find that their report had been so much appreciated and that it had provoked a very interesting discussion.

The President announced that the next meeting would be held on April 6, when Mr. P. Taylor would read a paper on "The Reinforced Concrete Pier at Swansea."

Reinforced concrete will last as long as plain concrete in any situation provided that certain special precautions are taken during its construction. The precautions to be taken are as follows:—

Concrete.—The materials (cement, sand, and stone) must be of good quality. They must be most carefully and thoroughly mixed and scientifically proportioned, so as to be practically water-proof and air-proof. The mixture must be fairly wet and must be well punned into position so as to minimise voids. The aggregate should be as non-porous as possible, and any aggregate which is known to have a chemical action on steel should be avoided. The aggregate should all pass through a $\frac{3}{4}$ inch mesh. The concrete covering should in no case be less than $\frac{1}{2}$ inch, and it is suggested that if round or square bars be used the covering should not be less than the diameter of the bar. In structures exposed to the action of water or damp air the thickness of covering should be increased at least 50 per cent., or the size of the aggregate should be reduced so as to insure a dense skin. In the case of structures exposed to very severe conditions, the concrete might be covered with some impervious coating as an extra precaution.

Steel.—The reinforcement should be so arranged that there shall be sufficient space between one piece and its neighbour to allow the concrete to pass and to completely surround every part of the steel. All steel should be firmly supported during the ramming of the concrete, so as to avoid displacement. It should not be oiled or painted, and thick rust should be scraped and brushed off before placing.

General.—The scantling of the various members of the structure should be sufficient to prevent excessive deflection. If electric mains are laid down, very great care must be taken that no current is allowed to pass through the reinforced concrete. Fresh water should be used in mixing, and aggregates charged with salt should be washed.

These recommendations have regard only to the prevention of corrosion of steel and not to fire-resistance or any other property of reinforced concrete.

[The Editor will not be responsible for the opinions expressed by Correspondents.]

Pulchritudo Pulchrior.

SIR,—The Vicar of St. Stephen's, Hampstead, or one of his predecessors, is to be congratulated upon having furnished the sanctuary of his church with some very delightful and appropriate candlesticks, delightful and appropriate as possessing that warmer and more human beauty which comes of irregularity of line and surface, an irregularity which, whether it be due to time or incapacity or intention, renders old buildings and furnishings far more attractive than new ones.

S. CLAUDE TICKELL.

25 Carlingford Road,
Hampstead, N.W.: April 12, 1911.

A CHURCH is to be built in Bolton at the corner of Thomas Holden Street and Chorley Old Road in connection with the St. Barnabas Vestry.

THE Birmingham Town Council have given notice of their intention to provide a public elementary school for about 1,000 children at Belcher's Lane, Bordesley Green.

THE Royal Academy of Arts give notice that they will elect, in May next, a Turner annuitant. Applicants for the annuity, which is of the value of 50%, must be artists of repute in need of aid through the unavoidable failure of professional employment or other causes. Forms of application must be sent in by the 29th inst.

FORTHCOMING EVENTS.

Saturday, April 22.

Building Trades Exhibition, Olympia, opens April 22—May 6.
Institution of Municipal Engineers: Meeting of the Eastern District at Cambridge.

Monday, April 24.

Architectural Association: Professor Beresford Pite on "Alberti and Bramante: Architecture a Profession or an Art in the Cinque Cento."

Surveyors' Institution: the adjourned discussion on Mr. W. R. Baldwin Wiseman's Paper on "The Conservation of our National Water Resources," and on Mr. W. Vaux Graham and Mr. H. F. Bidder's Paper on "Judicial and Parliamentary Decisions with regard to Rights in Underground Water since 1907," will be resumed.

Illuminating Engineering Society: Mr. Haydn T. Harrison on "The Rates of Light to Illumination," and Mr. P. J. Waldram on "Some Notes on the Effect of Wall-Papers upon the Illumination of Interiors."

Friday, April 28.

Society of Architects: Twenty-seventh Annual Dinner to be held at the Holborn Restaurant.

THE BUILDING TRADES EXHIBITION.

THE exhibition which opens to-morrow promises to be as useful as any of its forerunners for the particular purpose which it has fulfilled in the past and which is really its only *raison d'être*, that is to afford manufacturers and traders an opportunity of showing, and architects and builders an opportunity of seeing whatever is either new or good in the materials and processes connected with up-to-date building.

The poster of the exhibition with its promise of the House Beautiful and AMOR entering the Agapemone has suggested to some that the Building Trades Exhibition is on the way to becoming a popular show. This would be to revert to the bad old days at the Agricultural Hall, when the exhibition endeavoured to combine the pleasure of the populace with the business of the professional, to the detriment of both. Hence the series of failures from which Mr. MONTGOMERY rescued the concern, culminating in the successes of 1907 and 1909 at Olympia. We should therefore deeply regret to see any introduction of the popular element even to the limited extent of the happy home and the 150*l.* cottage.

We are assured by the promoters of this year's exhibition that everything not germane to the building trades has been refused admittance to Olympia, and that there will be no bands this year, as objection has been taken to these by some exhibitors in the past as being detrimental to business. Neither have there been arranged by the promoters any papers or lectures to distract the attention of visitors from the contents of the stalls and stands. An improvement from the exhibition point of view has been made to Olympia by the removal of the wall dividing the annexe from the main building, thus enabling the numbering of the rows to be carried through consecutively from top to bottom.

There does not appear to be any outstanding or epoch-making novelty to be found in the exhibition, though in very many instances there are improvements in manufacture which mark progress. These we shall have occasion to notice when the exhibition is open.

The only exhibits to which our attention has been called as novelties are a model cottage and a model of a warship. The former has been erected by Messrs. CORNES & HAIGHTON in conjunction with a number of other firms, in order to furnish "an example for Garden Cities, Model Villages, and Municipal Housings," which can be built in brick "for 220*l.* detached, or in pairs at a reduced figure."

Messrs. PARSONS exhibit the model of "H.M.S. Endelline" as an attraction for their show of paint and enamels. We can quite understand that misgivings have arisen when such histrionic appeals to popular interest are features of the Building Trades Exhibition. If this is purely a business concern, can it be imagined that any

architect will specify or any builder use a particular enamel paint simply because it is advertised and illustrated by a pretty and cleverly executed model of a warship?

Neither the 220*l.* cottage—the price has risen since the early Letchworth days—nor the model battleship look to us like genuine business of the building trade. The professedly 150*l.* cottage and the garden city house have done a great deal of harm to the art of architecture and to honest building by implanting in the mind of the British public the idea that cheap and pretty houses can be obtained for next to nothing.

Nor are we impressed with the advantage from a business point of view of the fact that the Hammersmith Road entrance to the exhibition has been fitted up as a sort of lounge. We fancy the exhibitors prefer that visitors shall lounge at their stands rather than anywhere else.

We regret that the collection of architects' drawings, which has been a feature of the Building Trades Exhibition on several past occasions, is not included this year. There are so many good drawings produced each year in architects' offices for which there is not room at the Royal Academy, that an exhibition at least once in every two years is almost a necessity. Certainly such a collection interests architects and attracts them to the exhibition, and architects, we take it, are amongst the visitors whom the bulk of the exhibitors most wish to see at their stands rather than the ladies who may be moved to enthusiasm, more or less real, by pretty cottages and models of warships.

Although we do not admire the type of exhibit to which Messrs. CORNES & HAIGHTON and Messrs. PARSONS are treating the public, we have nothing to say against their enterprise if they think they are likely to get business thereby, but we think that such a show as that of the United Stone Firms, who have gone to considerable expense in order to show the capabilities of their materials, is more useful to the expert visitor and more strictly germane to the functions of a Building Trades Exhibition.

The list of official visits is longer this year than at the last previous exhibition. A number of invited members of the Royal Institute of British Architects and members of the Architectural Association will be present to-morrow, the opening day. On Monday, April 24, the Surveyors' Institution have their visit; on Tuesday, April 25, the Institute of Sanitary Engineers; on Wednesday, April 26, the Institution of Heating and Ventilating Engineers; on Thursday, April 27, the London Master Builders' Association, the Institute of Builders, the Pressed and Stock Brick Makers' Association; on Friday, April 28, the Royal Sanitary Institute; on Saturday, April 29, the Institute of Municipal Engineers, the Institution of Municipal and County Engineers, and the Swedish Institute

FROM A PICTURE BY DOMENICHINO.

of Clayworkers; on Monday, May 1, the Concrete Institute; on Tuesday, May 2, the Institute of Clayworkers; on Wednesday, May 3, the Society of Architects. The Glazed Brickmakers' Association, and the Hospital Officers' Association are also expected to pay official visits on dates which, at the time of writing, have not yet been fixed.

These official visits are good features, as they undoubtedly bring more visitors of the right sort than would otherwise attend. We should advise exhibitors to make note of the times of these visits and to take care that at those times their stands are in charge of competent attendants.

NOTES AND COMMENTS.

THERE is likely to be some dissatisfaction amongst unsuccessful competitors at the result of the competition for Coventry Municipal Buildings and proposed Town Hall. As we announce elsewhere, the design of Messrs. GARRATT, SIMISTER, BUCKLAND & FARMER has been placed first. On several occasions Messrs. GARRATT & SIMISTER have sent designs that have taken a high position in competitions, and so also have Messrs. BUCKLAND & FARMER. In the answers to competitors' questions it was stated with respect to the now usual condition that designs were to be prepared by each architect competing and his regular assistants only, that "It is expressly intended to prohibit temporary partnerships and arrangements merely for the purpose of the competition."

TRUE, the answer goes on, "Where two firms of architects are in partnership it is a different matter, and no objection would be raised in this case to the submission of a joint design." This is a most unfortunate paragraph. If two firms join in partnership they are no longer two firms, but one. If two firms join together to send in drawings for any particular competition, they are in a partnership of a temporary character which "it is expressly intended to prohibit."

WHAT the original clause, as now usually inserted in competition conditions, does intend to prohibit is the employment by a man with money but insufficient brains or time for the winning of a competition of a man with brains but insufficient money, in short, of a "ghost." There can be no question of such an arrangement between Messrs. GARRATT & SIMISTER and Messrs. BUCKLAND & FARMER. But the explanation that in this competition it is expressly intended to prohibit temporary partnerships is certainly likely to cause trouble, and it may be very pertinently asked, At what date did the announcement of the partnership of Messrs. GARRATT, SIMISTER, BUCKLAND & FARMER

appear in the *London Gazette*? And the Council of the city of Coventry, together with the assessor, are entitled to ask for production of the stamped deed of partnership of the new firm in order that they may be satisfied that the conditions of the competition have not been violated.

To destroy a spire for the sake of its lead in order to pay for the repair of a church tower is indeed a futile proceeding, and we sympathise with the concern of Dr. Cox that such a fate should be threatening the church of Great Baddow, near Chelmsford. Here it seems ivy has once again exercised the destructive influence for which its picturesqueness is no adequate recompense. We admit that an ivy-clad ruin is picturesque. There is no doubt about the ruin, but churches that have served for ages as places of worship, and still so serve, are better fitted for their function if they are not ruins. So ivy must go.

THE Imperial Arts League, from the reports of the Secretary and Hon. Treasurer which were presented at the second annual general meeting, appears to be making very satisfactory progress through the difficulties that oppress such an institution in its early career. The various formalities that have to be gone through and the objections of official bodies that have to be overcome are many and troublesome. Hence we are glad to hear that the League is now within a measurably short distance of being incorporated with a limited liability to its members. The advance in membership from 600 to 800 is also an encouraging feature.

MR. H. C. CORLETTE, the Hon. Treasurer, was able to present a satisfactory report on the finances of the League, in spite of the heavy extraordinary or non-recurring expenditure entailed by preliminary organisation and incorporation. This result was in part achieved by the admission of life members, an expedient that is not without ample precedent, but is nevertheless financially unsound, as it means the exhaustion of capital, to obtain which continuing obligations have been incurred. We are pleased, therefore, to note that the Council of the League recognise this and propose to repay from income the capital thus expended, and for the future to devote amounts received for life subscriptions to an Endowment Fund. It is clear from the report of the general meeting and from the *Journal* that the Imperial Arts League is on the way to do good work for artists.

GLASGOW'S Corporation seem now to intend trying to run the crusade against consumption as a national memorial to King EDWARD in opposition to the Edinburgh scheme for Holyrood, and has adopted the report of its representatives at the late Edinburgh meeting suggesting

that the Lord Provost of Glasgow should be requested to convene a meeting of representatives of town and county councils to consider the subject of a memorial. The request is fairly open, but it seems to us that the meaning of it is that as Edinburgh will not adopt the form of national memorial that Glasgow wants, the latter intends to try and take the lead and push forward its own project as a national one.

THE present popular interest in Housing and Town Planning may be expected to evolve some differences of opinion, and, as with all popular movements, there is a danger of rushing off too far on one tack and oversteering the mark, the best housing for the people. Just now the Garden City holds the imagination of the general, and hence it is not surprising to find that when the Sheffield City Council passed a resolution recommending the Sutton Trustees to spend their proposed 50,000*l.* grant to the city in block dwellings a meeting convened by the Federated Trades Council passed the following resolution: "This town's meeting strongly protests against the action of the City Council, at its March meeting, recommending the trustees of the late Mr. W. R. SUTTON to build block dwellings for Sheffield workers, and desires to place on record its conviction that money spent by the above trustees on cottages in the suburbs would be greatly appreciated by Sheffield people."

Of course the trades unions want the advantages of the Sutton bequest for their own members. But the block dwellings are not to be built for "Sheffield workers," but for "Sheffield poor," for those who cannot afford to live in cottages and ride to and fro from their work, when they have any, and who must therefore live, somehow, in the heart of the city. It is for these that the Sutton bequest is intended, so that they may live in decency and some measure of comfort. Hence the block dwelling must remain, and the Sutton Trustees are well advised to do what they can to enable the block dweller to live under better conditions than are at present open to him. This is a side of the housing question that must not be forgotten in the popular enthusiasm for the garden suburb.

A SKETCHING TOUR AROUND BRIGHTON

By DOUGLAS C. LEIGH.

NOTHING is more interesting than an attempt to discover a county's characteristics, and that charm entirely their own, which most of our English counties possess. An architect naturally notices architectural subjects first, and delights in endeavouring to find the origin of this or that feature which helps to give the buildings in the county in which they occur its individual charm.

There is no difficulty in recognising the peculiar beauties of Sussex, with its broad sweeps of downs, broken by slight mounds and hollows, where clumps of trees and shrubs, such as oaks, ashes and bushes of box, surround some old world church, farm or cottage.

Most of the village churches are of Norman origin, and like those of New and Old Shoreham have suffered comparatively little through the centuries, though of course containing portions of later work; the flinty stones (of which many are almost entirely built) being practically imperishable.

A distinctive church feature is the low hipped roof to the towers, covered with beautifully weathered red tiles which afford a striking and happy contrast to the yellowy green of the stonework. Rottingdean is one of the best examples of this.

The variety of materials available to the old builders for their house building is remarkable and they took every advantage of it. In Anne of Cleves' house at Lewes, so called because she lived here a short time, the lower portion is partly built of stone, partly of brick, with diaper work of flints and stone to the porch, whilst the upper portion is tiled, with half-timbered work in places. What the effect was originally of course can only be surmised, but now that time has weathered and toned down the whole of it, the effect is quite happy.

There is one feature in these old houses which is common to many, and serves common-sense and structural purposes as well as artistic, and that is the curved oak braces supporting the eaves of the roof between two slightly projecting gables. This recess afforded shade and shelter, and the long shadows thrown by the eaves in contrast with the sunlight on the gables is very effective.

Sussex possesses many beautiful towns and villages, but perhaps none more charming than Lewes and Steyning.

Lewes with its quaint, clean, bright streets, with their sudden descents, and its fine old castle, strikes one as being a typical English country town. The castle was built by William, Earl de Warrenne, son-in-law of William the Conqueror, and much of it together with its imposing entrance gateway, still in excellent preservation, can be seen.

COTTAGE AT OLD SHOREHAM, SUSSEX.—From a sketch by Mr. D. C. LEIGH.

Steving of course is smaller than Lewes, but for quaint picturesqueness the street containing the Grammar School can hardly be surpassed.

THE SOCIETY OF ARCHITECTS.

A MEETING of the Society of Architects was held on Thursday, April 6, at their premises in Bedford Square, Mr. Percy B. Tubbs, F.R.I.B.A. (vice-president), in the chair. After some preliminary business, Mr. Percy Macquoid read the following paper on—

The Evolution of Form in Silver Plate.

The subject of silver plate is such a very vast one that I propose to-day only to deal with the matter in connection with the growth and development of its form, excluding all that is strictly ecclesiastical, and limiting myself to the domestic plate of this country produced during Tudor times and onwards.

The possession of gold and silver plate has always been a mark of wealth and distinction. Highly important gifts between persons of distinction or to colleges and municipal guilds invariably comprised plate in some form; hence the spirit of emulation was aroused for the production of the most beautiful and ingenious variety of workmanship, and to fulfil these demands we find records in early times of a very high class of intellect devoting its artistic endeavours to this craft. To design fine plate, as indeed to design anything, it is necessary to be able to draw with skill and accuracy, so we find that in the fifteenth and sixteenth centuries many of the greatest painters abroad were designers of goldsmiths' work. Unfortunately, there were but few fine draughtsmen in this country, and this without doubt accounts for the fact that so much of our early English plate owes its origin in form to foreign sources, for we had to go to France, Italy, or Germany for designs in the Tudor, Gothic, and Renaissance times, and very frequently employed foreign workmen, so that the plate made here during these periods invariably reproduced foreign motives; but later on, as painting and architecture became individual to this country, we clearly see the development of fresh spontaneous impressions, and eventually the separation of foreign ideas, which is strongly marked by simplicity and solidity. It is useless to attempt to describe examples of English Gothic plate anterior to the middle of the fifteenth century, for with the exception of a few chalices and spoons no specimens remain that can be conscientiously assigned to this date, but there is no doubt from the pre-Reformation inventories, such as those of Winchester College, the City companies, and certain private individuals, that the amount of Gothic silver plate made in England must have been very great. In an inventory taken of the Winchester College plate in 1535, a large quantity of secular silver is enumerated, whilst the ecclesiastical plate given to the College Chapel by William of Wykeham and other donors amounted to nearly 4,000 ounces of silver and 92 ounces of gold, which was confiscated in the reign of Edward VI. The well-known King's Lynn Cup may or may not be English, but it essentially belongs

to a period of art before 1450, and although we may assume that we possessed a school of architecture at that time strongly tinctured with national taste, it is more easy to arrive at a conclusion on this point, for buildings survive the wear and tear of centuries, whereas the precious metals then being so valuable were constantly being melted down for the purpose of financing some war or personal raid for which ready money was required, in addition to the wish to create new and fashionable shapes to please the ever-varying taste of the rich men of those times, and so the examples of genuine Gothic domestic plate are now, alas! few and far between.

It is on the subject of the evolution of form from some of this existing plate that I propose to speak, and I think I can best explain my meaning by selecting as example those objects that are most familiar to us all. There have been three principal kinds of drinking vessels, exclusive of horns, to which we need not refer. The bowl, developing into the cup, the tanker or tankard, and the beaker. The earliest form of cup was a bowl of metal or wood, generally the latter, and in mediæval times called a mazer. They were generally formed out of the pollarded and, consequently, knotty portions of the maple or other trees, and owing to the hard quality of the wood were almost imperishable, and capable of a high degree of polish. In the fifteenth century, these wooden mazers were surrounded—originally, no doubt, to preserve their edges—by a band of silver gilt an inch or so deep, frequently ornamented with a motto, and for strength on the inside a small silver gilt disc, called a print, engraved and sometimes enamelled with a sacred emblem. A considerable number of these mazers are in existence, preserved chiefly in the museums and colleges. The drinking-cup belonging to Oriel College, Oxford, is of the second half of the fifteenth century, and is the earliest form of drinking cup for domestic use. The shape is Oriental, and it was probably brought over by the Crusaders. This must have been an extremely awkward vessel to handle, and it soon struck someone to improve matters by mounting the bowl on to a stem or foot, making it at once more decorative and convenient for use, as in the case of the well-known specimen in the possession of Caius College, Cambridge, called the Cup or Standing Mazer of "the three Kings." In the so-called "Anathema Cup" belonging to Pembroke College, Cambridge, which bears the very early hall-mark of 1481, the bowl and stem begin to blend together in a completed design, the bowl becoming bell-shaped and departing from the mazer form. This cup owes its name to the circumstance of the donor, Thomas Langton, a Bishop of Winchester, having had engraved on its base: "Qui Alienaverit, Anathema sit" (Whoever steals this, let him be accursed). Most effective words, as after 420 years the cup still remains in its original place. Twenty years later another development took place, the cup becoming straightsided, with a flattened base, but the feeling is still apparent of a bowl mounted on a truncated stem. This rare specimen, bearing the London hall-mark of 1500, and the Anathema Cup originally possessed a cover. These would have been fairly flat and tapering to a point on which a finial of steel-top shape, probably enamelled with the arms of the owner or sometimes a precious stone,

supposed to act as an antidote to poison, completed the design of the cup.

The extreme simplicity of the stems in the cups up to this period should be noted, for in another few years elaboration of design in this part of the cup commences. These decorated stems were first introduced from Italy. Lorenzo the Magnificent was an ardent collector of everything beautiful, and some of his most treasured possessions being antique Roman bowls, cut of solid agate, lapis lazuli, or crystal, some artists of the Renaissance conceived the notion of mounting these on stems with handles of gold or silver. The solid mass of the plain stone had to be relieved by a fanciful design in the metal, sometimes enamelled, and even this, to render it more fanciful, was often further ornamented with pearls, rubies, and other precious stones. The English and German goldsmiths were quick to appreciate the new idea, and having no Roman bowls we find them towards the end of the fifteenth century mounting ostriches' eggs, cocoanuts, nautilus shells, ivory, or anything else that came handy. The plain cocoanut cup belonging to Oriel College, Oxford, is of the end of the fifteenth century. Another specimen elaborately carved with scriptural subjects, and the mounting stem and cover richly worked in the style of the Renaissance, is dated 1576, and in a third and much later example an ostrich's egg is mounted to form the bowl, the lid being composed of the upper part of the egg, surmounted by a little figure. This cup is of the date 1623, but such a cup as this of so perishable a nature was probably more for ornament than for use. To adapt these same stems and forms to a metal bowl was a very natural step, as was reducing the cup to a flat tazza shape, still keeping the baluster stem. These were much the same in character as the raised dishes used for sweetmeats, and were a most graceful form of cup. The first is of the date 1570, the second about thirty years later, and the third 1625; this last is smaller in size and slenderer in proportion, and one clearly sees here the strong influence of the Venetian wine glass that was slowly coming into use, for by the end of the seventeenth century silver wine cups had ceased to be much in requisition, glasses and beakers having entirely superseded them. Tankards came into existence towards the middle of the sixteenth century. In all probability they were an outgrowth from the ewer and stone-ware jug. These plain stone-ware or salt-glaze jugs were first made in Germany, and like many other things than have come from that country since, were both cheap and ordinary. They were imported over here in large quantities for quite common use, but a fashion arose for mounting them with silver covers, bases and side straps of highly-finished workmanship. That the jugs themselves were considered worthless is evident from a remark in a letter from the Venetian Ambassador, resident at our court at the time, for he says: "The English have a curious habit of mounting quite common pottery with silver in the most elaborate manner, and these they are very proud of." The fashion for these mounted stone-ware jugs went on for upwards of fifty years, and they were highly esteemed. The convenience of a hinged cover attached to this form of drinking vessel must have struck the craftsman as a distinct scientific advance, and for the hot spiced drinks so much in vogue at that time, far more practical than a loose cover. This rounded form of tankard soon became in Elizabethan times straight-sided, slim, and graceful in shape, engraved or repoussé with fine strapwork intersected with mouldings, frequently having masks or other ornament added in chased work.

About the date 1640 all ornament is suddenly dropped, and the tankard becomes plain, still maintaining a narrow shape, but with a so-called petticoat shooting out at the bottom introduced, so that the person whilst drinking could grip the tankard with his left hand, the handle ending in a whistle for obvious reasons. This sudden cessation of ornament in plate, save for some light lines of engraving or a coat of arms, had been slowly coming into fashion since 1635, and owed its origin to the simplicity of life affected by the Puritanical faction, which culminated under Cromwell into the neglect of all that was beautiful. The tall tankard of 1640 well represents its period, and although of a shape made for ecclesiastical purposes as a flagon was also in domestic use.

A few years before the Restoration and after, the drum of the tankard becomes shorter and wider, as they are reduced in height and the petticoat disappears, but they remain plain except for some pseudo Chinese engraving, slight flat applied ornament, called by some card-cutting, or introduction of an acanthus border at the base. There are many

ROTTINGDEAN CHURCH.

large tankards decorated in a similar fashion belonging to the City companies.

In the eighteenth century the lid of the tankard became dome-shaped, and the sides curved. Beakers are best described as tumbler-shaped vessels. Originally in Gothic and early Tudor times they were mounted on either a plain base or on feet, in the form of dogs, lions, or human heads, and had covers of pyramidal shape, surmounted with some cognisance or object emblematical of the owner, or a precious stone that served as a talisman.

The word beaker is Scandinavian, and derived from the Greek bika, and probably imported into Northern Europe by the Varangian Guards, the shape of the vessel being suggested by the end of a horn, which was the recognised drinking vessel of the Dane and the Saxon. The beaker was never so popular here as in Germany.

A very beautiful example is a beaker belonging to Christ's College, Cambridge, and given by Margaret Beaufort, the mother of Henry VII. It is dated 1507, and is covered with most typical decoration of that period. The beaker is found throughout the sixteenth century with the sides generally ornamented with engraved strap-work, but at this time this particular form of drinking vessel was probably not used by the very rich, as its decoration and workmanship ceased to be so well considered or elaborated as in the contemporary wine cup. In Charles II.'s reign a smaller kind sprang into existence. These had slightly outcurved edges, and were plain except for bands of engraved repoussé ornament, and were used till the end of William and Mary's reign. They were evidently a cheap form of gift, corresponding, I presume, to the two-guinea wedding present of to-day, as they are almost always found with initial prick-mark letters of donor and recipient, together with the date. Small English beakers of this class are very rare now, for, being insignificant as decoration, they were melted down when superseded by glass. Some have survived by being given or left to the Church for use as Communion cups, and these have in many instances been parted with again as not suitable for the purpose.

The large Standing Cups, or hanaps, as they were called, were intended for decorative purposes, and were only used at ceremonial banquets, as is the case to-day. These embodied in their form and decoration all that I have already described as pertaining to the wine cup, and being on a so much larger scale the changes of form and ornamentation are easily traceable. The earliest known English hall-marked hanap is the Leigh Cup of quite the end of the fifteenth century. These important cups were made throughout the sixteenth as more or less English reproductions of a mixed German and Italian style, inspired by the school of Cellini, generally with a human figure on the lid or cover. The so-called Leigh Cup, in the possession of the Mercers' Company, dated with the London hall-mark of 1499, is a very

THE GRAMMAR SCHOOL, STEYNING, SUSSEX.—From a sketch by Mr. D. C. LEIGH.

characteristic Tudor-Gothic specimen, and the elaboration of detail in the workmanship is most remarkable. It stands about 16 inches high, while the cup belonging to Corpus Christi, Cambridge, is 21 inches high; this is dated 1570, and is in the richest style of the English Renaissance, with the strong foreign influence very evident. At the commencement of the following century the end of the stem where it joins the bowl is often opened out into three little ornamental brackets, and a perforated spire, again supported by three little brackets, added to the cover. These are generally spoken of as Steeple Cups, and bear the last example of Renaissance influence in English plate. The proportions of a Steeple Cup are comparatively poor to those previously referred to, and suggest that the silversmith, rapidly coming to an end of his resources, took refuge in building up unconnected form. Apparently the public of that time were also of that opinion, for towards the end of Charles I.'s reign the fashion for Standing Cups was in the semblance of a large plain tea-cup on a baluster stem devoid of decoration except for engraving, or sometimes just a granulated surface.

Probably at this time the dearth of anything new in design was caused by the small demand for more important pieces, all spare money being required for the King's Army or the opposing Parliamentary forces. Whilst many historical collections of old plate were melted down by loyal subjects for the King's cause, and every form of art languished, as is invariably the case under socialistic tendencies, with the reign of Charles II. all fresh design in the form of the Standing Cup died out, and when it re-appeared it was an evolution of the porringer.

Porringers and Caudle Cups are practically the same class of vessel. They were introduced midway through the seventeenth century for the possets and hot drinks that were so much indulged in then. The earliest are rather gourd-shaped, narrowing at the neck, and have a cover and dish, on which they were carried, and always have handles. The bowls and covers are ornamented with the form of decoration prevalent at the moment, and those of Charles II.'s reign are generally found bossed out with large fat flowers and fruit; later, again, with classical design in the form of acanthus or spiral gadrooning. This latter pattern goes on into the following century. The handles were originally ornamented with a recumbent female torso in the Renaissance taste. In fact, the bulbous form of the porringer does not lend itself to beautiful decoration, and it is evident that the artist having ceased to design, the silversmith had taken the fashioning entirely into his own hands, and was turning them out by scores. With the exception of pseudo Chinese engraving, all porringers seem to be decorated in a variation of one of these three grades of style. The evolution of form in their handles is most interesting to note. There is still some attempt at grace of modelling in the figures, but in the constant repetition by the craftsman without any fresh

design, these develop into lumps, then beads, and finally into two protuberances to rest the thumb on. Another curious detail like this is the whistle at the end of a tankard handle, originally in Jacobean times constructed as a real whistle with a view to ordering yet another drink. It deteriorated through reproduction, like the third eye of the antediluvian Saurian, till it became a useless cavity.

By the commencement of the eighteenth century the handles have become quite plain, and the porringer being no longer in requisition, the next evolution of design was to mount it on to a base, hence the beginning of the two-handled cup and the shape that for some mysterious reason has ever since been consecrated to the racing prize. The base gradually becoming taller and the bowl narrower, it developed in the reign of George III. into the well-known classical urn-shape bearing the strong "Adams" stamp. It will be evident how very vividly plate bears the imprint of form and decoration of the moment in which it was made, and that the decoration of plate reached its zenith in the middle of the sixteenth century, for there was a realism of thought at that time and a straightforward convincing power of strength conveyed by the masterly touch of artist and craftsman working in unison, that has never been surpassed. Its detail and design, too, had then reached to such an art that though concentrated down into a piece but a few inches high, it is so full of detail, so marvellous in proportion, that the same motives could be applied to an object twenty times its size and nothing be lost.

When the influence of Cellini and the goldsmith artists of that time began to wear itself out, plate commences its decadence, for the simple reason that the intellectual power is lacking. The Steeple Cup of James I., many of which were designed by George Herriot, the King's goldsmith, proves that the best goldsmith of that time was not comparable with those that had gone before, and in Stuart times, though there is much that is exceedingly beautiful, the lack of artistic feeling becomes still more evident, and the elements of quantity, not quality, begin to supplant all individual interest. A very favourite form of decoration at the time of the Restoration, and which kept in favour for thirty years, was large, shapeless, bossed-out flowers and fruit, amongst which, doubtless, in an ecstasy of newly-discovered loyalty, a fat lion and unicorn gambol, and one turns with relief to the severer taste introduced during the reign of William III. This, as well as the plate of Anne and George I., is dependent for beauty only on its proportions and mouldings. What greatly set off the proportions in the silver of this period was the extreme beauty of surface; this is caused first by the actual quality of the metal, which was of Britannia standard between 1696 and 1720, and by the numberless hammer-markings, which produced an irregularity on the plain surface, distributing the effect of light softly over the curves. In the plate of George II.

and III., the hammer marks are visible on the interior, but generally a polish was put on the outside by the workman before parting with the piece, and, in consequence, plate of that period much resembles the smooth manufactured efforts of to-day, on which the high brilliancy of the silver is concentrated into a diamond-like spot, by the combined efforts of butler and footman. In old plate the charm of surface is no doubt added to by the infinite amount of little points and imperceptible scratches consequent on wear, that reflect the light and give a curious whiteness to the metal; it is a minor detail, but it is also a minor attraction that the modern manufacturer cannot give. Many collectors prefer to keep their specimens with the surface oxidised and uncleaned, but I doubt whether in this way they do not lose much beauty of undulation of surface, especially in the instance of only slightly decorated articles.

Metal work is intended to look like the metal it is chosen to represent, and in all ages its exterior form has been considered with a view to brilliance. To obviate much cleaning in the highly-decorated pieces, these were generally gilt, but in early times you will find the plainer portions left in the silver, and this is called parcel-gilt. There is a praiseworthy attempt in these days to revive the hammered surface, but at present the effort to obtain the result is too apparent. The art of using a tool sufficiently large to give the infinite variety is no longer understood, and the results, therefore, are purely methodical and mechanical.

I now pass to the evolution of form in the very familiar and necessary objects, spoons and forks, the former of which indicate the varieties of change very clearly. No exact age can be assigned to the spoon, but the earliest records we have would seem to be Egyptian, about 2,000 B.C. The rudimentary idea of a spoon is supposed generally to have originated from a shell; indeed, its Latin name, *Coclearius*, more or less proves this conclusively to be the case. The first development must have been to mount the shell on to a handle of wood, bone, or metal, then the whole thing was roughly fashioned out of one of these materials, hence the complete spoon. It is interesting to note how the taste in the matter of shells reverted back, for in Renaissance times we find rare shells, rock crystal and agate, &c., being constantly used for bowls mounted to elaborate metal handles. The earlier the spoon the more the bowl approaches to the shape of a plover's egg, the pointed end being near the handle. In the Byzantine, Roman, and Gothic spoons the bowl is on a much lower level to the handle—let down, as it were, by a little step. By the fifteenth century, this step disappears, but the bowl still remains well below the handle, and continues to do so for many years. In Gothic times the handles were square-sided, and the tops terminated with some ornament: an acorn, a diamond-shaped knob, lions sejant, human heads or whole figures, such as the Apostles, and finally it became what is known as the seal top, which is simply the handle terminating in a flat base without any ornament, and this flat, plain surface being filled in with prick-mark initials. There is also a spoon called a slip-top, which originated in the middle of the sixteenth century from having (according to the ultra rigorous ideas of the then new Protestant religion), had the Apostle removed, together with the base on which it stood, leaving just the stem; others were then made to match these, and so a fashion was created that existed for a time. For about a hundred years from the middle of the sixteenth century the seal top form of spoon was more generally prevalent than any other. Isolated examples are even found as late as 1679, but these are rare. The original shape of the seal was hexagonal, and the necking or little moulding supporting it similar in character. Early in Elizabeth's reign this seal becomes rounder, and the plain necking develops into a little flattened ball, divided into sections something like a microscopic canteloupe melon. Towards the end of the century this ball is exchanged for a little vase of baluster-like shape, with low acanthus relief, the seal top still remaining round. This continues through the reign of James I., and then the ball under the seal is once more introduced on the top of a rather longer baluster. This chronological evolution is a very certain way of dating unmarked spoons, for the changes, though subtle, are easily perceptible to a close observer.

The heads of all these spoons, be they Apostles, lions, or seal tops, were invariably cast, and were dovetailed into the stem with a little tongue, the bowls and stems being always of hammered metal. These really vary very little, but as the spoon progresses through the sixteenth century the bowl becomes less like the oval of a plover's and more like the oval of a hen's egg, till finally it resembles the outline of a duck's egg. I can think of no better simile than this familiar

object, and most probably it was from the egg that all ovals originated their infinite variety. In lion top spoons the animal is sejant, and no doubt a representation of the British lion of the period. The figures of the Apostles are generally crude and stumpy, bearing a strong family resemblance to each other.

Isolated specimens bearing the child's patron saint were frequently presented as christening gifts. A complete set, however, of thirteen with what is called the master spoon, is extremely rare. That spoons of all kinds were thought a great deal of and were a much treasured form of plate is evident from the way they are mentioned in wills and other documents, even as far back as the thirteenth century. The form of the spoon obviously does not lend itself to much variety and treatment of decoration, and when every idea in the way of terminal finish had been exhausted a novelty from France, introduced by Charles II. with the Restoration, was welcomed. This marks a most sudden and distinct change in the whole form of the spoon; the bowl became a perfect oval, with the handle quite flat, the top of which broadened out, and was cleft with three divisions into a rude resemblance of a hind's foot, hence called "pied de biche," or sometimes "fish tail." The bowl of these Charles II. spoons is quite on a level with the stem, and is strengthened at its juncture by a pointed prolongation of the stem into the back of the bowl, termed a rat-tail. Originally this rat-tail was contrived merely for strength. There had existed abroad in earlier times a combined fork and spoon, in which the prongs of the fork folded over the back of a moveable bowl fitting into little sockets, and this, no doubt, suggested this addition.

Originally this tail was decorated, the rest of the spoon remaining plain, though a few specimens are found after 1776, with an engraved or die-stamped pattern on the back of the bowl and front of the handle. These flat spoons continued with variations into Anne's reign, and the clefts at the top of the handle being gradually omitted, and the bowl by degrees becoming deeper, it took the form we are accustomed to eat with to-day.

About 1710 the handle of the spoon was bent forward, and was more rounded, with a strong rib running down the face of it—this rib is a very characteristic feature for twenty years or more. Eventually the rat-tail becomes shorter and squarer, and finally degenerates into the hideous excrescence with meaningless little shoulders that we find on modern

spoons, and as the rat-tail disappears so the handle commences to curve backwards. I have refrained from touching upon what I will call fancy spoons, such as ladles, mulberry or tea spoons, &c., as they do not indicate the changes so clearly; but I would like to say just a few words about forks. These were originally two-pronged, and existed as early as the fourteenth century, mention of them being found in inventories of that time, but whether these were English or all imported from abroad it is impossible to decide. However, at that early period it is certain that they were not used in conjunction with the knife for meat, but merely for sweetmeats and fruit. In the earliest examples the prongs are of steel and the handles of silver, ivory, amber, enamel, or some such substance. The fork as an adjunct to the knife at table was first used in Italy, but came to us from France. There is a set of silver forks existing in Cornwall, belonging to Lord Mount Edgcumbe, dated 1667, which are the earliest set of English forks known. They are three-pronged and flat-handled, like spoons of the same period. Although three-pronged silver forks were at first most general, isolated examples of four prongs are also found of that same date, and occasionally instances of two prongs; these two-pronged silver forks may seem extremely inconvenient to our modern ideas, but it must be remembered that our ancestors ate their vegetables and small food from the back of their knives.

The fork followed precisely the same evolution as the spoon, the flat handle giving way to the round, with a smaller rib down the front. This rib in course of time disappeared, and the fourth prong, which had been omitted for over one hundred years, was re-introduced as a permanency, for the modern three-prong forks we so often see now are merely copies of those of the eighteenth century.

Of forks and their variety there is little to say. Fingers were made before forks, and played so important a part at a meal that we can quite understand the practical necessity of the rose-water dish. At the time when art interested herself most in plate, forks were virtually non-existent, and so but little care and thought have been expended on them.

I have this evening been able to touch most lightly on my subject, and for want of time have mentioned but a very few of the leading forms of plate, out of many hundreds of existing examples. I have endeavoured to select only the clearest types of their period without regard to any individual merit, so as to put before you some idea of the gradual growth of form and decoration. Isolated specimens and even a reverting back to a previous fashion in no way affect the onward movement.

This onward movement was also a downward one, for we have with us now more or less successful flying machines, such scientific concentration of food that you can almost feed an army on one pill, but the art of making beautiful silver plate with many of its sister arts has departed from among us, and we may well cherish as we do in museums, colleges, city companies, and private collections the few genuine specimens of English Gothic and Renaissance plate that have survived, for it is the plate of this period that has never been surpassed in either dignity, design, or decoration. Jacobean, Stuart, and Georgian plate, graceful and beautiful as it is, such as the work of the Vyners and Paul Lamerie, was only evolved out of what had gone before.

Mr. Percy B. Tubbs formally proposed the vote of thanks.

Mr. G. A. T. Middleton, in opening the discussion, said that he had felt considerably disappointed on learning that the subject of the paper was not to be "English Furniture," as announced, for, like most architects, he knew something about furniture. But his opinion was now somewhat changed, for he had come to the conclusion that he had learnt considerably more from the paper just read by Mr. Macquoid than if it had been on furniture. One thing which was particularly interesting about plate was the way in which the precise date of an object could be ascertained by means of the hall-marks. This was not possible in dealing with furniture. Consequently, the student of plate can get down to rock bottom at once, and know exactly where he stands. This renders the tracing of the evolution of ornament much more interesting and much more exact. It also helps the architectural student of the evolution of Renaissance ornament to see how it can be chronologically traced on Old English silver plate, and how it evolved. It was usual to assign general dates, but it would seem as if they would be able to be more precise in the future. He was curious to know whether the plate made during the Elizabethan period was not partly the work of Italians, of whom there were many in the country.

Mr. Freyberg said there was proved to be no cause for regret in the change of subject, but rather for congratulation.

The subject of the development of English decoration of whatever form always brought forward those two historical characters whom they, as architects, must dislike most—viz., Henry VIII. and Oliver Cromwell. With regard to the evolution of silver plate in this country, there seemed to him to be a distinct foreign influence visible in some of the silver work of the Renaissance period. No doubt many of Benvenuto Cellini's assistants came to this country and left their influence on works of art, which now afford us much enjoyment.

The vote of thanks was then carried with acclamation.

Mr. Percy Macquoid, in alluding to what had been said about foreign workmen, remarked that there was no doubt in his mind that some of the finest plate was produced by Huguenot refugees at the time when the strongest Elizabethan motifs were in existence. Probably the foreign influences came from France and Holland rather than from Italy. The first definite record of any foreign workmen being employed for any other art besides architecture occurred in connection with the erection of the building of marvellous Nonsuch Palace.

CATHEDRAL SERIES.—ELY.

NORTH TRANSEPT, OCTAGON, AND PART OF NORTH SIDE OF NAVE.
WESTERN TOWERS AND SOUTH SIDE OF NAVE.

THE photographic views of Ely Cathedral originally issued in our Cathedral Series having been rather fewer in number than the importance of the church demanded, we now resume our illustrations from photographs by Mr. J. W. Borland.

ST. PETER'S CHURCH, LANCASTER.

THE work carried out from the designs of Mr. G. Gilbert Scott at St. Peter's, Lancaster, consists of the altar, reredos, hanging canopy, and steps and paving in the sanctuary. The altar is of white marble, and on the front is carved a representation of the Last Supper. The reredos takes the form of a large coloured and gilded triptych. In the wings are painted panels representing, on the Gospel side, the Saints mentioned in the canon of the Mass before the Elevation of the Host; and, on the Epistle side, those mentioned in the canon of the Mass after the Elevation. The main portion of the triptych is occupied by sculptured panels representing subjects embodying the idea of the Divine Sacrifice, the central panel at the top showing the descent from the Cross. Immediately below this is a richly canopied throne for the monstrance. The reredos is surmounted by a cresting symbolising the Crown of Thorns and a sculptured representation of the Crucifixion with an angel at each side at a lower level. The base on which the triptych stands is of black bird's-eye fossil marble. The hanging canopy over the altar and reredos is of an oblong shape, with a panelled soffite and a richly carved cresting round the top. The whole canopy is decorated with gold and colour, and it is suspended by chains from the roof. The sanctuary steps and paving are of black and white marble. The white marble throughout has been specially treated with the object of toning it down and giving it an ivory-like appearance.

NO. 180 NEW BOND STREET, LONDON.

THESE premises have been built on the site formerly occupied by a building erected about the end of the eighteenth century, and forming a portion of the estate of the late Mr. Davis, the famous art collector and dealer, of Bond Street. Mr. Davis's business is still carried on by his eldest son, Mr. C. Davis. The building was designed and planned so as to be suitable for commercial purposes, and consists of five floors and basement, and is fitted with an Otis electric lift. The front is in Portland stone, with certain insertions of Blue York. Messrs. William Cubitt & Sons, of Gray's Inn Road, were the contractors. The stone carving was carried out by Mr. John Hearn, of West Street, Pimlico, to the architect's models. The total cost of the building was about 7,000l. There were some very fine ceilings and woodwork in the old building. A portion of them was shown by Mr. C. Davis at the Franco-British Exhibition held in London two years ago. The new building has been erected from the designs and under the superintendence of Mr. Wm. Flockhart, F.R.I.B.A.

PUGIN STUDENTSHIP DRAWINGS.

WE this week reproduce some of the drawings submitted for the Pugin Studentship this year by Mr. J. Hill.

SKETCH OF CLEVELAND HOUSE
J. LEWIS

THE PAINT AND VARNISH SOCIETY.

A GENERAL meeting of the Society was held at St. Bride's Institute, London, E.C., on April 6, Mr. J. Cruickshank Smith occupying the chair. A paper entitled "The Decorator in Ancient Times," as printed in our last issue, was read by Mr. Noel Heaton.

DISCUSSION.

The Chairman said Mr. Heaton had given a delightful résumé of some of the most important and interesting facts connected with old-time decoration, transporting the mind back both geographically and historically to places and eras very far removed from the present. It was well known that Mr. Heaton had made a special study of the subject, and therefore spoke both as an expert and an enthusiast. The paper contained many interesting observations with regard to particular kinds of decoration, and explained very clearly the different condition both with regard to the material and to atmosphere which existed in the countries which he had described; and Mr. Heaton had distinctly shown that the quest for permanence was not a recent undertaking, but had existed as long ago as 4,000 years B.C. He had been a little surprised to learn that the question of the medium used in the old decorative methods could be disposed of so easily; that there was practically no medium at all, water, in conjunction with the binding property of the surface on which the pigment was placed, constituting the only medium necessary to obtain the results. If that was the generally accepted view, it showed that media must have been developed at a much later period than was ordinarily believed, and it would be interesting to know whether it was accepted by experts that no medium at all with the exception of water and the binding properties of plaster was used in those very early times. In looking at the analysis of the plaster and of the limestone he had been struck by the similarity between them. It was worthy of note that the particular limestone and plaster spoken of were by no means very pure carbonates of lime. Many of the limestones found at the present time contained a much larger proportion of calcium carbonate than 91 per cent., and it might be that the traces of iron, alumina, and magnesium might possibly have had some bearing upon the hardness and consequently the permanence of the surface produced. He was not certain, but he believed that Mr. Heaton said that lime was put on the prepared surface in the form of calcium oxide, and that the slow carbonising action changed that ultimately into calcium carbonate. It would be interesting to know by what process of reasoning that had been established, because it should be borne in mind that the plasters were subjected to an exceedingly small quantity of carbon dioxide. He should like to know

whether it had been definitely proved that sufficient carbonising could go on even during the lapse of centuries to turn the whole of a thick layer of calcium oxide into a carbonate form. In dealing with the pigments used on the walls, Mr. Heaton mentioned a blue which was a kind of frit, a yellow which was probably an ochre, and a red which was an iron oxide. He should like to know whether he came across any traces of black pigments or greens. From the standpoint of the artist he was as much interested in the paper as from the standpoint of paint technology, but he would leave that matter to be dealt with by those more qualified than himself. Mr. Heaton's concluding remarks on the decoration to be found in Roman remains were especially interesting. He recollected some time ago visiting a Roman camp at the village of Chesthouse in Northumberland, where there were some very interesting illustrations of crude decoration in a house which was understood to be a centurion's house. The walls were of rough rubble coated with plaster, on the top of which existed a well-preserved cartoon decoration.

Mr. Batten thought Mr. Heaton had given one of the most interesting accounts he had ever heard of fresco painting, laying stress on what was really the most remarkable aspect of it. In a great number of arts there had been ups and downs, but in the art of lime plastering, which was the necessary basis of all fresco work, there appeared to have been a steady deterioration for some four thousand to six thousand years, and he did not know whether the bottom had yet been reached. In an ordinary house it was seldom possible to find a wall left in a state fit to be looked at until it had been covered over with distemper or paper. That a plasterer should plaster an ordinary wall and leave it with so fine a coat that it required nothing further done to it was beyond his understanding of his task. In all times men looked back on earlier work. In the time of the Renaissance they looked back to the classic work of Rome, and marvelled at the manner in which ancient plaster work was done. In the time of Augustus, Vitruvius spoke with wonder of the ancient Grecian plaster work, which, he said, was done incomparably better than the work in his own period. The ancient Greeks might have looked back in envy on the early Minoan plasters, which still stood as examples of pure and beautiful work. So far as lime plaster was concerned, it seemed to be perfectly true that the old was better than the new. In the art of fresco painting plaster was an important thing, because if the plastering was not well done the painting was worthless. The art of fresco painting had never died out. There were times when little was done, but it had continued to the present day and was still being carried on. He did not think there was room for any doubt as to the

way in which the paint adhered to the plaster. The introduction of any medium would impair rather than help the permanency of the painting. The only enemy to fresco was the sulphur in the atmosphere of modern towns. He had been especially interested in Mr. Heaton's account of the cave that had been found in Crete, because in Dante there was a very extraordinary passage in which the seat of ancient Empire was set in Crete, and Dante spoke of a great cavern lying in Crete (which he described as a land altogether wasted). In the cavern the poet imagined a great image, representing temporal sovereignty, and from that image there flowed down tears which cut channels in the rock and made passages down to Hell. He wondered whether the superstitions that Mr. Heaton spoke of as attaching to that cave would fit in with the mediæval tradition preserved by Dante.

Mr. Matt. F. Garbutt, F.R.I.B.A., said he had read a good many papers on decoration, but never one from the point of view taken by Mr. Heaton that evening. Like most of the papers read before the Society, it was of a practical character and very useful. He remembered reading that the Romans prized their plaster for its own beauty of surface; they took a delight in a fine and hard plaster which they could polish by rubbing down. They were fond of the red pigment, which was found largely in Pompeii, because it was the colour they found best to set off the inherent beauty of the plaster. He should like to know whether Mr. Heaton had ever studied the cave paintings in India, and whether he could say in what medium they were executed. He was under the impression they were in tempera, and it appeared that the scale of colours described by Mr. Heaton was also similar to that of the Indian paintings. In some of the colours that had survived from antiquity he believed there was a blue which was thought to have been originally green, and it would be interesting to have some information upon that point. The Greeks seemed to have been expert in making very hard plaster, some of which survived on the surface of their work to-day. He was particularly interested to note that the Minoans carried the plaster over the steps of their buildings, as that was a proof of its extreme hardness, though he did not quite understand how such a hard plaster was obtained by the method mentioned. With regard to the simplicity of the tools of the modern plasterer, as a general rule it might be said the simpler the tools the better the workmanship. There was no man with simpler tools than the blacksmith, and no man who showed a greater amount of skill. The example of Egyptian plaster work inlaid in stone was absolutely new to him, and suggested a borrowing from the metal worker's methods. The undercut matrix for the insertion of the inlaid material was a method that had been used by the metal worker from the very earliest times, and if Tubal Cain did any inlaid work he probably undercut the ground in the same way.

Mr. Bussell also complimented Mr. Heaton on his interesting and valuable paper, and hoped it would be only one of a series delivered to the Society. The many interesting details gave rise to a host of thoughts, but he would only touch on three points upon which he wished to have information, the first having relation to the brush marks found upon one of the paintings. Logically, brush marks denoted brushes, and it would be interesting to know what the brushes were made of. In Knossos Mr. Heaton said the plaster work had been greatly damaged by fire, but he thought there must have been other things as well, because at the present time the London County Council recommended plaster to protect wooden partitions from fire. The third thing that had struck him was that plaster had won the love of people in all ages. Many people considered plaster work to be deadly monotonous and other than artistic, and he had been wondering what had led to so consistent an appreciation of the work; whether it was the smoothness of surface or the fact that it kept out draughts. He also wished to know whether the decorative schemes of ancient times embraced the use of woodwork.

Mr. Noel Heaton, in replying to the discussion, thought Mr. Batten had replied to the remark of the Chairman with regard to medium. It was a matter of common knowledge that no medium was used in the case of fresco painting, and he was quite certain that what he had described was fresco painting, as the result of careful experimental investigation. Previously, it was supposed that the practice of fresco painting was not introduced until the time of the Romans; in fact, when he (Mr. Heaton) published the results of his experiments, several people wrote to him to know if he was quite sure of his facts. He did not know if his views were generally accepted, but until it could be shown that

there was any flaw in his reasoning he was prepared to maintain them against anybody. With regard to the composition of the plaster, it was true it was not as pure as a chalk limestone, which contained 95 to 96 per cent. of carbonate of lime, but the proportion of alumina and silica was not sufficient, he thought, to give it any hydraulic properties. It was conceivable they used a part of their lime burned, mixed with another part of limestone unburned; in this case the analyses would be identical, and both substances would be amorphous, and it was difficult to obtain any evidence. He had made numerous experiments in the endeavour to decide this point one way or the other, but up to the present had only negative evidence to offer; that is to say, that by no method of investigation had he succeeded in distinguishing one part of the plaster from another. With regard to the hardness, a very interesting point cropped up. In an earlier period the plaster was very much coarser and not so white, and there was a very considerable proportion of aluminium silicate, not clay, but something in the way of a zeolite, which decomposed in hydrochloric acid; and it struck him that possibly this may have had some function in hardening the plaster. The matter, however, required further investigation. With regard to the question of carbonation, fresco painting was carried on at the present day in exactly the same way, the setting of the plaster fixing the pigment. The carbonation of the surface commenced immediately the painting was exposed to the air, but it was true that the conversion of the entire mass of hydrate into carbonate was a very long process, and in the thickest portions of the plaster one could find light traces, after three thousand years, of hydrate of lime. With regard to pigments, he had found no green in the Roman work, the blue being mixed with yellow to obtain green. In the Roman period, however, they used a green and several additional pigments, such as madder and red lead. In the Roman villa at Knossos he had referred to there was a green which was very freely used, a sort of terre verte. With regard to the steady decline in the art of plastering and the technique of it, it was to be hoped that investigations such as he had described might be useful in drawing attention to what had been done in the past, and possibly help to recover some of the ancient traditions. Some people dismissed such archaeological work as being of no practical utility, but the great thing to show the bearing of the information gleaned or obtained was the improvement of modern practice. The great trouble in connection with fresco painting was the effect of sulphur in the shape of sulphuric acid arising from the combustion of coal, and that of course was a trouble that was not so much in evidence in ancient times. Sulphuric acid condensing on the surface of the plaster re-acted with the carbonate of lime and formed sulphate of lime, which, in its fully hydrated state, had no setting power, and was extremely soluble in water. Undoubtedly the ancient plaster was used in the first instance as a means of protecting the building stone from decay. The Minoans used a local stone which was a crystalline gypsum, and it was for that reason the Venetians had to build an aqueduct to bring the water to Candia from the mountains, the local water being undrinkable from its having flowed through the strata of gypsum and become contaminated with sulphate of lime. Where the excavations had been uncovered for years, and the stone was not protected by plaster, the stone melted away like sugar, and he had photographs showing square blocks that had been greatly damaged in as short a time as three years. With regard to the cave and Dante's poetry, the cave described in the paper was by no means the only one or the most important one on the island. In the Minoan times the natural caves were considered as holy places, and offerings were deposited there, and excavations of a cave in Mount Dicte had revealed a number of such cultus objects. He himself had penetrated into a cave on the other side of the island for hundreds of yards, and at the extreme end had discovered pieces of pottery which showed that the cave had been used in ancient times. It was perfectly true that the Romans were fond of plaster-work, and subjected it to a polishing operation before the plaster was set. They made it into a beautiful hard and polished surface, and he had discovered pieces polished in that way on the site of the Roman villa at Knossos. He thought it was a practical suggestion to put forward that red was extensively used because it took a polish well, but the same thing was to be found in the Minoan work, where a red background was almost invariably employed in the important rooms and those apparently used for ceremonial purposes. Probably it was a tradition derived from very early times which came to have some symbolical meaning.

Mr. Bradford here pointed out that even to-day the natives of Africa used a red, known in this country as Kaffir

THOMAS A BECKET'S PALACE, TARRING.
From a sketch by Mr. D. C. LEIGH.

red, with which they smeared their blankets before wrapping them round their bodies.

Mr. Heaton thought the tradition of the use of red went back to pre-historic times. Red would be the first and easiest pigment obtainable except yellow ochre, being obtained by grinding hematite or burning yellow ochre. He found the yellow stood quite as well as the red. He exhibited a fragment from Knossos, which had been turned up in the excavations, and inadvertently left exposed to heavy rains in winter and hot suns in summer for ten years, and the colour had not changed in the least. As regards the cave paintings of India, he was not in a position to say anything as regards their execution at present, but Mrs. Herringham, who was at present in India making reproductions of these paintings, had promised to procure specimens for him to examine. It seemed to him that there was considerable similarity between these and the remarkable distemper paintings discovered by Dr. Stein in Central Asia. He had no knowledge of the inlaid decoration of the chapel of Nefermaat in Egypt being derived from metalwork traditions, but it must be remembered that that was very early in date. It was quite unique, and no other specimen existed, and it was a most charming piece of work. As to brushes, no specimens of tools had been found, but it was quite certain that the work was done with brushes. He had seen several specimens of Egyptian brushes, which were generally made by doubling a bunch of fibres and binding them with string. With regard to damage by fire, Mr. Bussell would remember that a fierce fire would destroy the surface of the plaster by re-converting it into lime. It was certain that Kumar was destroyed by a conflagration which destroyed the greater part of the paintings, and the strong smoke obliterated the decorations, and there were few fragments which were not damaged either by smoke or calcination. Woodwork was used, and it was possible to trace where it existed. Very often there was a timber frame construction filled in with rubble, the weight being taken evidently by the timbers. He had in his possession some rather interesting photographs showing the holes where the timber could be distinctly seen. It was a debated point as to whether the plaster work was carried over the timber.

A hearty vote of thanks having been accorded to the author for his paper, the meeting concluded.

THE NATIONAL GALLERY.

THE annual report for 1910 of the Director of the National Gallery is rendered notable by the fact that it records the bequest of nearly two hundred pictures from the collection of Mr. George Salting. These cover a wide period, ranging from Benvenuto da Siena (1436-1518) to Jean François Millet (1814-1875). Under the terms of the will of Mr. George Salting, the Gallery not only came into possession of the 28 pictures which Mr. Salting had lent to the Trustees, but the Board had the right of selecting from his collection any paintings which they might deem worthy of a place in the Gallery, and 164 pictures were ultimately so selected and are described in detail in the report. Some ambiguity appeared to exist as to the custody of the finished water-colours and the miniature portraits, both of which might be considered as pictures. The National Gallery Board did not

desire to press any claim to the water-colour drawings, but expressed a wish for the custody of the miniatures. A decision on this point was, by the consent of all the parties interested, left to the law officers of the Crown, who have decided that on the true construction of the will the collection of miniatures passed to the keeping of the Victoria and Albert Museum, South Kensington, and was not liable to be selected for the National Gallery.

The purchases for 1910 were "The Poringland Oak" (2,700*l.*), by John Crome; "Dr. Hoadley, Bishop of Winchester" (2,000*l.*), by William Hogarth; "A Family Group" (1,000*l.*), ascribed to Jan Vermeer; and a "Landscape," by W. Buitenweg.

Amongst the gifts were "Portrait of a Gentleman," by G. F. Watts, R.A.; "Portrait drawing of M. Rodin," by W. Rothenstein (given by Mr. G. Bernard Shaw, through the National Art Collections Fund); "Our Lady of Good Children," by Ford Madox Brown; "Monna Pomona," by D. G. Rossetti; "Oberon, Titania, and Puck," by William Blake; "Refreshment" and "Study for Marlow Ferry," by Fred Walker; "Study for the Pied Piper of Hamelin" and "Strolling Players," by G. J. Pinwell; "Panthers resting," by J. M. Swan, R.A. (given by the National Art Collections Fund); "Mother and Child" and "The Drawbridge," by Jacob Maris; "Watering Horses," by Anton Mauve; "Interior of Haarlem Church," by J. Bosboom; "The Philosopher," by Josef Israels; "Grandfather's Birthday" and "Fish Market, Dieppe," by Eugene Isabey; "Le Pont Marie," by S. Lepine; "A Castle by a Lake," by B. Wilson; the following six pictures by T. Gainsborough—"A Ruined Churchyard," "A Road by a Rock," "Cattle and Tree," "Derwentwater," "A Cottage in a Wood," and "A Woodland Glade"; "Christ Blessing," by Benedetto Diana; "Pencil study of an Olive Branch," by John Ruskin; "Portrait of J. M. W. Turner, R.A.," by J. T. Smith; Palette used by J. M. W. Turner, R.A., "Portrait of Sir Joseph Duveen," by Emil Fuchs; "The Shipwrecked Mariner," by Josef Israels; "Portrait drawing of a Dead Boy," by Alfred Stevens; and twenty architectural subjects by Edward Lear (who exhibited during the third quarter of last century).

The Trustees acknowledge the receipt of 4,250*l.* from the Committee of the National Loan Exhibition of 1909 as a payment on account of the profits of that exhibition, such sum to be expended in the purchase of pictures for the National Gallery.

Two works of art were purchased last year under the terms of the Chantrey Bequest—a large canvas by Arnesby Brown, A.R.A., entitled "Silver Morning," and a bronze equestrian figure of "Sigurd," by Gilbert Bayes. The latter has been placed in the Gallery of British Art; the former is on loan at the Royal Society of Artists, Birmingham.

The precise number of works added to the different schools in the two Galleries during 1910 was as follows:—Italian Schools (49), Dutch School (71), Flemish School (15), Spanish School (2), German School (3), French School (34), and British School (86).

The Turner Gallery annexed to the National Gallery of British Art, Millbank, presented by the late Sir Joseph Duveen and completed by Mr. Joseph Duveen, has received the Turner Bequest pictures and was opened to the public on July 20. Nineteen characteristic examples have been retained at Trafalgar Square to represent the painter in the history of European art, including the two pictures which, in accordance with a special clause in Turner's will, are placed in juxtaposition to two pictures by Claude Lorrain. A certain number of Turner's water-colour drawings have also been retained at Trafalgar Square. The extension of the Gallery at Trafalgar Square so long urgently needed is now complete, but the fireproofing of the older parts of the building is not yet finished, although it is hoped that the eastern wing section, which was the first begun, will be completed shortly.

The Gallery in Trafalgar Square was visited by 630,882 persons on the free days during the year, showing a daily average attendance on such days (207 in number) of 3,047. In addition to the above number, 69,012 persons visited the Gallery on Sunday afternoons throughout the whole year, showing a daily average attendance of 1,380. On students' days (Thursdays and Fridays) 58,974 persons were admitted between January 1 and December 31, 1910; the admission fees (at 6*d.* each) amounting to 1,474*l.* 7*s.*, as compared with 1,584*l.* 15*s.* 6*d.* received in 1909.

The National Gallery, British Art, at Millbank, has been visited by 276,149 persons on the free days during the year, showing a daily average attendance on such days (206 in number) of 1,340. In addition to the above number, 65,859 persons visited the Gallery on Sunday afternoons throughout the

whole year, showing a daily average attendance of 1,317. On students' days (Tuesdays and Wednesdays) 44,506 persons were admitted between January 1 and December 31, 1910; the admission fees (at 6d. each) amounting to 1,112l. 13s., as compared with 911l. 11s. 6d. received in 1909.

The amount annually realised by admission fees at both establishments is devoted as an "Appropriation in Aid" of the Parliamentary Vote to the National Gallery.

The total number of students' attendances in the Gallery in Trafalgar Square on Thursdays and Fridays throughout the year was 15,796. Independently of partial studies, 739 oil-colour copies of pictures have been made, viz., 422 from the works of 99 old masters and 317 from the works of 21 modern painters. One hundred and forty-five new students have been entered on the books during the year.

The total number of students' attendances at the Gallery of British Art on Tuesdays and Wednesdays throughout the year was 6,415; and 298 completed copies of the pictures have been made in oil-colours, 110 in water-colours, and 11 in pastel. Eighty-eight new students have been entered on the books.

UNIVERSITY OF LONDON LECTURES ON ARCHITECTURE.

LATER Byzantine architecture was dealt with by Mr. Banister Fletcher in his lecture, the last of the session, at the British Museum on Tuesday, March 21.

The style, he said, had altered but little since the days of Justinian, showing that the Greek Church had not changed. The principal examples are to be found at Constantinople; others there are in S. Mark's, Venice; S. Fosca, Torcello, churches in Greece, Macedonia, Armenia, and Russia. The style even crept into France, brought by the traders with the East through Venice.

S. Irene at Constantinople is situated in the first or outer court of the palace of the Sultan, and is one of the oldest and best preserved of the Byzantine churches. It occupies the site of an earlier church erected by Constantine and several times rebuilt. In 740 A.D. it was destroyed by earthquake, and re-erected after that as we now see it. It has retained its original basilican plan, with nave and two aisles, approached by an atrium and narthex in two storeys, but has the eastern treatment in the apse. The nave is in two divisions: the first western division is a rectangle covered by an oval flat dome; the second eastern division is a square covered with a dome forty-three feet in diameter. It is thought to be the earliest example of a dome raised on a high drum with windows in it admitting light to the interior. The semi-circular apse, in which the seats for the presbyters are still to be seen, is covered by a semi-dome. The walls externally are in courses of brick and stone, a favourite treatment in the Byzantine style. The church, which is close to S. Sophia, is now used as an armoury by the Turkish Government.

The church of S. Theodore, also known as the Theotokos Church, dates from the twelfth century. The western front, which consists of the outer narthex, is one of the most elaborate in Constantinople, and is built of brick and stone in bands. An arcade of columns supports semi-circular
